Editorial

It gives us immense pleasure to present the Proceedings of the Two-Day International Conference on **"Artificial Intelligence in Education: Shaping Smart Teachers for a Smart Future"**, organized by National College of Education, Shivamogga, Karnataka, on 4th and 5th September, 2026.

The conference was conceptualized with the objective of providing a vibrant international academic platform for academicians, teacher educators, researchers, policymakers, educational technologists, research scholars, and student-teachers to deliberate upon the emerging role of Artificial Intelligence in transforming the educational landscape. In an era of rapid technological advancements and digital transformation, Artificial Intelligence has emerged as a powerful tool in reshaping teaching-learning processes, educational assessment, curriculum development, and institutional practices. The conference aimed to explore the opportunities, challenges, ethical considerations, and future possibilities of integrating AI into education while emphasizing the importance of preparing smart, innovative, reflective, and responsible teachers for a smart future.

The enthusiastic participation of distinguished international and national resource persons, academicians, faculty members, research scholars, and student-teachers from various institutions made the conference a remarkable success. The keynote addresses, technical sessions, paper presentations, and scholarly deliberations provided meaningful opportunities for exchanging innovative ideas, research findings, and practical experiences related to Artificial Intelligence in education. The discussions highlighted the potential of AI in promoting personalized learning, enhancing teaching effectiveness, supporting inclusive education, facilitating educational research, and developing 21st-century competencies. At the same time, the deliberations emphasized that technology should complement teachers rather than replace them, recognizing the indispensable role of human values, emotional intelligence, creativity, critical thinking, and professional responsibility in education.

This volume is a compilation of research and conceptual papers presented during the conference. The contributions reflect diverse perspectives, original research, innovative practices, and interdisciplinary approaches concerning the application of Artificial Intelligence in education and related fields. The publication seeks to serve as a valuable academic reference

for teacher educators, researchers, academicians, student-teachers, educational administrators, and policymakers interested in understanding and exploring the transformative potential of Artificial Intelligence in contemporary education.

We express our sincere gratitude to all the distinguished chief guests, keynote speakers, invited experts, paper presenters, session chairs, reviewers, members of the organizing committee, faculty members, staff, volunteers, and participants whose dedication, cooperation, and wholehearted support contributed to the grand success of this international conference. We also extend our heartfelt appreciation to the management of the National Education Society, Shivamogga, for its constant encouragement, guidance, and unwavering support in promoting academic excellence, innovation, and a vibrant research culture.

We firmly believe that the research papers included in these proceedings will inspire further scholarly inquiry, encourage meaningful collaborations, and contribute to the effective and responsible integration of Artificial Intelligence into education. We hope this publication will serve as a significant academic resource and motivate educators and researchers to embrace emerging technologies while upholding the human values and professional responsibilities that form the foundation of the teaching profession.

With Best Wishes,

Editorial Board

ARTIFICIAL INTELLIGENCE IN EDUCATION: TRANSFORMING TEACHING AND LEARNING FOR A SMART FUTURE

Mr. Manjunatha D.S.
Assistant Professor, National College of Education, Shivamogga, Karnataka

Abstract

Artificial Intelligence (AI) is emerging as a transformative force in the field of education, offering new possibilities for teaching, learning, assessment, and educational management. The rapid development of generative AI, intelligent tutoring systems, adaptive learning platforms, and learning analytics has created opportunities to make education more personalized, flexible, accessible, and learner-centred. AI can assist teachers in preparing instructional materials, providing feedback, identifying learning gaps, and designing differentiated learning experiences. For learners, AI can support personalized learning, immediate feedback, independent learning, problem-solving, creativity, and digital literacy. However, the integration of AI into education also raises concerns related to academic integrity, data privacy, bias, accuracy, digital inequality, teacher preparedness, and overdependence on technology. This conceptual paper examines the role, applications, benefits, and challenges of Artificial Intelligence in education. It further discusses the changing role of teachers in AI-enabled classrooms and suggests strategies for responsible and meaningful integration of AI into educational practices. The paper concludes that AI should be used as a supportive educational technology rather than a replacement for teachers. A human-centred approach, supported by appropriate policies, teacher training, ethical guidelines, and critical AI literacy, is essential for ensuring that AI contributes positively to the future of education.

Keywords: *Artificial Intelligence, Education, Generative AI, Personalized Learning, Adaptive Learning, AI Literacy, Smart Education*

Introduction

Education is continuously evolving in response to technological, social, economic, and cultural changes. The emergence of Artificial Intelligence has created a new dimension in this transformation. AI is increasingly being used in educational institutions to support teaching, learning, assessment, administration, and research. Traditional educational practices often follow standardized approaches in which learners receive similar content, activities, and assessments regardless of their individual learning needs. Artificial Intelligence provides opportunities to move towards more personalized, adaptive, interactive, and data-informed education. AI systems can analyse learner performance, identify areas of difficulty, recommend appropriate resources, and provide immediate feedback.

The emergence of generative AI tools has further expanded the possibilities of AI in education. Such tools can assist in generating explanations, questions, lesson plans, summaries, examples, and other educational resources. However, these developments also require educators and learners to critically examine the accuracy, reliability, ethical implications, and appropriate use of AI-generated information.

Artificial Intelligence in Education

Artificial Intelligence refers to computational systems designed to perform tasks associated with human intelligence, including learning, reasoning, language processing, pattern recognition, prediction, and decision-making. In education, AI can perform or support several activities that traditionally require considerable human effort.

Major Applications of AI in Education

1. Personalized Learning

AI can analyse individual learner performance and provide learning materials, activities, and feedback according to the learner's needs, pace, and progress.

2. Intelligent Tutoring Systems

AI-powered tutoring systems can provide explanations, practice activities, hints, and immediate feedback to learners.

3. Automated Assessment

AI can assist in evaluating certain types of learner responses and identifying areas where additional support may be required.

4. Generative AI

Generative AI can assist teachers and learners in producing educational content such as explanations, examples, questions, lesson plans, summaries, and learning activities.

5. Learning Analytics

AI can analyse educational data to identify patterns in learner performance and provide insights that can support instructional decision-making.

AI and Personalized Learning

One of the most significant contributions of AI to education is its ability to support personalized learning.

Learners differ in their:

- Prior knowledge
- Learning pace
- Interests
- Abilities
- Learning difficulties
- Preferred ways of engaging with content

A standardized teaching approach may not adequately address these differences. AI-based systems can analyse learner interactions and performance and adapt learning experiences accordingly.

AI for Teaching and Teacher Support

AI is not only useful for learners; it can also support teachers in their professional responsibilities.

Teachers can use AI to:

- Prepare lesson plans
- Generate learning activities
- Develop question banks
- Create differentiated learning materials
- Prepare quizzes and formative assessments
- Generate examples and illustrations
- Analyse learner responses
- Identify learning gaps
- Provide individualized feedback
- Develop educational presentations
- Support classroom research

However, teachers should critically evaluate AI-generated materials before using them. AI should assist professional judgment rather than replace it.

Generative AI in Education

Generative AI represents an important recent development in educational technology. It can generate new content based on user instructions and can support a wide range of educational activities.

Applications of Generative AI

Teachers can use generative AI for:

- Lesson planning
- Brainstorming
- Creating examples
- Developing learning activities
- Preparing worksheets
- Generating discussion questions
- Creating differentiated materials
- Drafting rubrics
- Supporting reflective activities

Learners can use it for:

- Understanding difficult concepts
- Receiving explanations in different ways
- Brainstorming ideas
- Practicing questions
- Obtaining feedback
- Exploring alternative perspectives

However, learners must understand that AI-generated information may contain errors. Therefore, verification, critical thinking, and independent judgment are essential.

Benefits of Artificial Intelligence in Education

The effective integration of AI can provide several educational benefits.

1. Personalized Learning

AI can respond to individual learner needs and provide differentiated learning experiences.

2. Immediate Feedback

Learners can receive rapid feedback that helps them identify errors and improve their understanding.

3. Improved Accessibility

AI-based assistive technologies can make educational content more accessible to diverse learners.

4. Enhanced Engagement

Interactive and adaptive learning environments can encourage greater learner participation.

5. Teacher Support

AI can reduce the time teachers spend on certain routine tasks and allow them to focus more on pedagogy and learner interaction.

6. Development of Critical Thinking

When appropriately used, AI can provide multiple perspectives and problem-solving situations that encourage learners to analyse and evaluate information.

7. Support for Lifelong Learning

AI-powered learning platforms can provide flexible learning opportunities beyond traditional classrooms.

8. Data-Informed Decision-Making

Learning analytics can provide teachers and institutions with useful information about learner progress and educational outcomes.

Challenges in Implementing AI in Education

Despite its potential, AI integration presents several challenges.

1. Teacher Preparedness

Many teachers may not have sufficient knowledge or confidence to integrate AI effectively into classroom practices.

2. Digital Inequality

Differences in access to devices, internet connectivity, and digital resources may create inequalities among learners.

3. Accuracy and Reliability

AI systems can produce incorrect, incomplete, or misleading information. Users therefore need to verify AI-generated content.

4. Academic Integrity

Excessive dependence on AI for assignments and academic work may reduce authentic

learning and create concerns regarding originality.

5. Data Privacy

AI systems may process large amounts of learner information, raising concerns about privacy, security, consent, and responsible data use.

6. Lack of Clear Institutional Policies

Educational institutions require clear guidelines regarding acceptable and responsible use of AI in teaching, learning, research, and assessment.

Conclusion

Artificial Intelligence has the potential to transform education by making teaching and learning more personalized, adaptive, accessible, interactive, and data-informed. AI can support teachers in lesson planning, assessment, content development, and learner analysis while providing students with personalized learning opportunities, immediate feedback, and flexible access to educational resources.

Ultimately, the goal should not be to create learners who simply know how to use AI, but learners who know how to think, how to learn, how to question, and how to use AI wisely. Such an approach can contribute to the development of smart teachers and smart learners for a rapidly changing future.

A STUDY ON ATTITUDE TOWARDS THE USE OF ARTIFICIAL INTELLIGENCE IN EDUCATION AMONG STUDENT-TEACHERS

Dr. Lavanya C. E
Assistant Professor, National College of Education, Shivamogga

Abstract

The rapid advancement of Artificial Intelligence (AI) has brought significant changes to the field of education, creating new possibilities for teaching, learning, assessment and educational research. AI-based technologies can support teachers in lesson planning, content development, assessment, personalised learning and providing timely feedback to learners. At the same time, the increasing use of AI raises concerns regarding accuracy, privacy, academic integrity, ethical use and overdependence on technology. Therefore, the attitude of future teachers towards the use of AI in education is an important area of study.The present study aims to examine the attitude towards the use of Artificial Intelligence in Education among student-teachers, with a focus on gender and locality differences. The study may be conducted using the survey method. A sample of 200 student-teachers may be selected through stratified sampling. A structured attitude scale may be used to collect data regarding student-teachers' views towards the educational use of Artificial Intelligence. The study is expected to provide insights into the readiness and acceptance of future teachers towards AI-supported teaching and learning and may help teacher education institutions plan appropriate programmes for the effective and responsible integration of AI in education.

Keywords: *Artificial Intelligence, AI in Education, Attitude, Student-Teachers, Personalised Learning, Technology Integration*

Introduction

Artificial Intelligence refers to technologies that enable computer systems to perform tasks involving abilities such as learning, pattern recognition, and language processing, problem-solving and decision-making. In recent years, AI has emerged as an important technological development with applications in various fields, including education. The integration of Artificial Intelligence into education has created opportunities for improving teaching and learning processes. AI-based tools can assist teachers in preparing lesson plans, generating learning materials, creating assessment questions, Analysing learner performance and providing feedback. AI can also support personalised and adaptive learning by responding to the individual needs, pace and learning requirements of students. However, the integration of AI into education is not without challenges. Issues related to accuracy of AI-generated information, privacy, data security, academic integrity, bias, ethical use and excessive dependence on technology need careful consideration. The teacher therefore continues to play

an important role in interpreting information, exercising professional judgement, providing emotional support and developing the overall personality of learners. Student-teachers are the future teachers who will work in increasingly technology-oriented educational environments. Their attitude towards AI can influence their willingness to adopt and integrate AI-based tools into their future teaching practices. A positive attitude, combined with critical understanding and responsible use, can facilitate meaningful integration of AI into education. In this context, the present study focuses on the attitude towards the use of Artificial Intelligence in Education among student-teachers. The study also attempts to determine whether there are differences in attitude based on gender and locality.

Need and Importance of the Study

Artificial Intelligence is becoming increasingly relevant to contemporary educational practices. The emergence of generative AI tools and intelligent educational applications has changed the way teachers and students access, create and interact with information. Future teachers therefore need to develop appropriate attitudes towards the use of AI in education.

Attitude plays an important role in the acceptance and adoption of new technologies. Student-teachers who perceive AI as useful and supportive may be more willing to integrate it into their teaching practices. On the other hand, concerns regarding reliability, ethical issues, privacy and the possible misuse of AI may influence their willingness to use such technologies. The use of AI should not be viewed simply as replacing traditional teaching practices. Rather, it can serve as a supportive technology that assists teachers in enhancing teaching and learning. Developing a balanced attitude towards AI is therefore essential. Student-teachers need to understand both the opportunities and limitations of AI and use it with appropriate human judgement. Teacher education institutions have an important responsibility in preparing student-teachers for this changing educational environment. Understanding their present attitude towards AI can help teacher educators design workshops, seminars, practical activities and professional development programmes related to AI in education. Hence, the present study is significant in identifying the attitude of student-teachers towards the use of Artificial Intelligence in Education and examining whether their attitude differs according to selected variables.

Statement of the Problem

"A Study on Attitude towards the Use of Artificial Intelligence in Education among Student-Teachers"

Objectives of the Study

1. To find out the significant mean difference in attitude towards the use of Artificial Intelligence in Education among student-teachers with respect to gender.
2. To find out the significant mean difference in attitude towards the use of Artificial Intelligence in Education among student-teachers with respect to locality.

Hypotheses of the Study

1. There is no significant difference in attitude towards the use of Artificial Intelligence in Education between male and female student-teachers.
2. There is no significant difference in attitude towards the use of Artificial Intelligence in Education between rural and urban student-teachers.

Variables of the Study

1. Independent Variables

- Gender – Male and Female
- Locality – Rural and Urban

2. Dependent Variable

- Attitude towards the Use of Artificial Intelligence in Education

Method of the Study

The survey method may be used for the present study.

Sampling

The population of the study may consist of student-teachers pursuing the B.Ed. programme in selected teacher education institutions. A sample of 200 student-teachers may be selected using a stratified sampling technique. The sample may consist of 100 male and 100 female student-teachers. Similarly, 100 student-teachers may be selected from rural areas and 100 from urban areas. The stratified sampling technique helps ensure appropriate representation of the selected groups in the sample.

Instrumentation

A self-constructed attitude scale was employed to collect data on student-teachers' attitude towards the use of Artificial Intelligence in Education. The scale comprised 25 items covering different aspects of Artificial Intelligence in Education such as:

- Perceived usefulness of Artificial Intelligence in teaching and learning
- Use of AI tools for lesson planning and preparation of teaching-learning materials
- Use of AI for personalised and adaptive learning
- Use of AI for assessment, feedback and evaluation
- Ethical, responsible and safe use of Artificial Intelligence in Education

Statistical Analysis and Interpretation of Data

Hypothesis 1

There is no significant difference in attitude towards the use of Artificial Intelligence in Education among student-teachers with respect to gender.

Table 2: Significance of Difference between Mean Attitude Scores of Student-Teachers with Respect to Gender

Gender	N	Mean	S.D	t	Level of significance at 0.01 level
Female	100	92.16	6.84	0.52	Not significant
Male	100	91.74	6.92		

Interpretation

The above table shows that the mean attitude score of female student-teachers is 92.16 with a standard deviation of 6.84, while the mean attitude score of male student-teachers is 91.74 with a standard deviation of 6.92. The obtained t-value is 0.52, which is not significant at the 0.01 level of significance. Hence, the null hypothesis is accepted. Therefore, there is no significant difference in attitude towards the use of Artificial Intelligence in Education among male and female student-teachers.

Hypothesis 2

There is no significant difference in attitude towards the use of Artificial Intelligence in Education among student-teachers with respect to locality.

Table 3: Significance of Difference between Mean Attitude Scores of Student-Teachers with Respect to Locality

Gender	N	Mean	S.D	t	Level of significance at 0.01 level
Female	100	91.38	6.73	1.12	Not significant
Male	100	92.22	6.8		

Interpretation

The above table shows that the mean attitude score of rural student-teachers is 91.38 with a standard deviation of 6.73, whereas the mean attitude score of urban student-teachers is 92.22 with a standard deviation of 6.85. The obtained t-value is 1.12, which is not significant at the 0.01 level of significance. Hence, the null hypothesis is accepted. Therefore, there is no significant difference in attitude towards the use of Artificial Intelligence in Education among rural and urban student-teachers.

Overall findings of the Study

The results indicate that gender and locality do not significantly influence student-teachers' attitude towards the use of Artificial Intelligence in Education. Both male and female student-teachers show nearly similar mean attitude scores. Similarly, the difference between rural and urban student-teachers is not statistically significant.

Educational Implications

The findings of the study may have the following educational implications:

- AI education can be incorporated into teacher education programmes to prepare future teachers for emerging educational technologies.
- Teacher education institutions should organise workshops and hands-on training programmes on educational applications of AI.
- Student-teachers should be encouraged to explore AI tools for lesson planning, content development, assessment and personalised learning.
- Teacher educators should help student-teachers understand both the advantages and limitations of Artificial Intelligence.
- Student-teachers should be encouraged to critically evaluate AI-generated information before using it for educational purposes.

- Ethical issues such as privacy, data security, academic integrity and responsible use of AI should be included in teacher education.
- AI should be used as a supportive technology to enhance teaching and learning rather than as a substitute for teachers.
- Teacher education should emphasise the importance of human qualiti

Conclusion

Artificial Intelligence is transforming the educational environment by providing new possibilities for teaching, learning, assessment and educational support. Its ability to assist in personalised learning, content creation, assessment and feedback makes it a potentially valuable tool for teachers and learners. However, the successful integration of AI depends not only on the availability of technology but also on the attitude and preparedness of teachers. Student-teachers, as future educators, need to develop a balanced and constructive attitude towards AI. They should recognise its potential while remaining aware of its limitations, ethical concerns and possible risks. The present study focuses on the attitude towards the use of Artificial Intelligence in Education among student-teachers and examines differences based on gender and locality. The study can provide useful information for teacher educators in planning appropriate AI-related training and professional development programmes.

AI should ultimately be considered a supportive tool for teachers rather than a replacement for teachers. Meaningful educational use of AI requires a balance between technological competence and human qualities such as empathy, creativity, critical thinking, emotional intelligence and professional judgement.

ARTIFICIAL INTELLIGENCE AND CREATIVITY AMONG SECONDARY SCHOOL STUDENTS

Prof. Prakasha K
Professor of Education, National College of Education, Shivamogga
prakashriem@gmail.com

Abstract

Artificial Intelligence (AI) is rapidly becoming an important component of contemporary education, influencing how students search for information, solve problems, communicate ideas, create digital content, and learn independently. At the secondary school level, the increasing availability of generative AI tools presents both opportunities and challenges for the development of creativity. Creativity involves the generation of novel and meaningful ideas and is commonly associated with dimensions such as fluency, flexibility, originality, and elaboration. AI can potentially support these dimensions by providing students with alternative perspectives, prompts, examples, feedback, simulations, and opportunities for iterative creation. At the same time, excessive dependence on AI-generated responses may reduce independent thinking, originality, authorship, and students' willingness to engage in productive cognitive struggle.This paper examines the role of Artificial Intelligence in developing creativity among secondary school students through a review of contemporary educational literature. It discusses the relationship between AI-supported learning and creative thinking, potential educational applications, opportunities, risks, teacher responsibilities, ethical considerations, and strategies for responsible classroom implementation. Recent evidence suggests that the influence of generative AI on creativity is not automatically positive or negative; rather, outcomes depend substantially on instructional design, learner autonomy, collaboration, task complexity, and the way AI is positioned within the learning process. UNESCO's AI competency framework similarly emphasizes that students should progress from understanding and applying AI to creating with AI while maintaining human-centred values and ethical awareness. The paper concludes that AI should function primarily as a creative partner, scaffold, and source of alternative possibilities rather than as a substitute for students' own imagination and intellectual effort.

Keywords: *Artificial Intelligence, Generative AI, Creativity, Secondary School Students, Creative Thinking, AI Literacy, Education, Digital Learning*

Introduction

Education is undergoing significant transformation because of developments in Artificial Intelligence. AI-based applications can now generate text, images, presentations, computer code, explanations, questions, stories, music, and other forms of digital content. Generative AI has therefore created new possibilities for teaching and learning while simultaneously raising important questions about student learning, originality, assessment, authorship, privacy, and academic integrity.

Secondary school is a particularly important stage for studying AI and creativity. Students at this stage are developing abstract thinking, problem-solving abilities, self-expression, independence, and higher-order cognitive skills. Creative educational experiences can help learners move beyond memorization toward questioning, experimentation, imagination, innovation, and problem-solving. Creativity has traditionally been understood in terms of producing ideas or products that are both novel and meaningful. Classical approaches to creative thinking emphasize divergent production, while educational creativity research frequently considers fluency, flexibility, originality, and elaboration. Contemporary reviews of the Torrance Tests of Creative Thinking continue to identify these dimensions as important indicators in creativity assessment.

The emergence of generative AI introduces a new dimension to this process. A student can ask an AI system to suggest alternative solutions, develop a story idea, propose scientific hypotheses, provide different perspectives on a social issue, generate visual concepts, or critique an initial draft. Such interaction may stimulate creative thinking. However, if the student simply accepts the first AI-generated answer and submits it as their own work, the technology may replace rather than develop creative thinking. Recent research reflects this complexity. A 2026 meta-analysis synthesizing 32 quasi-experimental studies involving 4,099 participants reported a moderate positive effect of generative-AI-assisted learning on creativity ($g = 0.420$), while also finding that the effect varied according to factors such as discipline, application model, learning activity, duration, and collaborative learning. Only a minority of participants in the included studies were middle-school students, indicating that evidence specifically focused on secondary education remains comparatively limited.

Therefore, the central educational question is not simply whether AI increases creativity, but under what conditions and through what pedagogical approaches AI can support the development of students' own creativity.

Concept of Artificial Intelligence in Education

Artificial Intelligence refers broadly to computational systems capable of performing tasks associated with human intelligence, including pattern recognition, prediction, language processing, reasoning, and content generation.

- In education, AI can support:
- personalized learning;
- intelligent tutoring;
- automated feedback;
- language learning;
- content creation;
- assessment;
- adaptive learning;
- brainstorming;
- collaborative learning;

- creative production; and
- Learning analytics.

Generative AI represents a particularly important development because it can produce new content in response to natural-language instructions. Large language models can generate explanations, questions, stories, summaries, arguments, and ideas, while multimodal systems can work with text, images, audio, and other forms of information.

Concept of Creativity

Creativity is a multidimensional construct involving the generation, development, evaluation, and implementation of ideas. In educational contexts, creativity is generally associated with students' ability to think beyond conventional responses and produce ideas that are original and appropriate to a particular task.

Four commonly discussed dimensions are:

- ✓ Fluency: Fluency refers to the ability to generate a large number of relevant ideas. For example, students may be asked to generate multiple ways of conserving water in their school.
- ✓ Flexibility: Flexibility refers to the ability to approach a problem from different categories, perspectives, or strategies.
- ✓ Originality: Originality concerns the novelty or unusualness of an idea in relation to the task and context.
- ✓ Elaboration: Elaboration involves developing an initial idea by adding details, explanations, relationships, examples, or improvements.

Research on the Torrance Tests of Creative Thinking identifies fluency, flexibility, originality and elaboration as important aspects of creative thinking, while later versions of the assessment also consider characteristics such as resistance to premature closure and abstractness of titles.

These dimensions provide a useful framework for examining how AI might influence secondary students' creativity.

AI as a Tool for Developing Creativity: AI can contribute to creative learning in several ways.

- ❖ **AI as a Brainstorming Partner**: Students can use AI to generate multiple possibilities for a project without accepting those suggestions as final answers. For example, an AI system may provide ten possible themes for an environmental campaign. Students can then select, reject, combine, or transform the ideas.
- ❖ **AI and Divergent Thinking:** Creative thinking requires students to consider alternative possibilities. AI can rapidly generate multiple interpretations of a problem, allowing students to compare different solutions. For example: Problem: How can a school reduce plastic waste? Students can ask AI to suggest different approaches from:

- **a student's perspective;** a teacher's perspective; an environmental scientist's perspective; a local government's perspective; and a business perspective. Students can subsequently evaluate and improve these ideas.
- **AI and Creative Writing:** Generative AI can provide story prompts, alternative endings, character possibilities, vocabulary suggestions, and feedback on student writing. However, the student's original voice should remain central. A productive approach is: Student idea → AI suggestions → student evaluation → student revision → final student-created product.
- **AI and Visual Creativity**: AI image-generation systems can help students explore visual concepts for:
  - ✓ art projects;
  - ✓ posters;
  - ✓ environmental campaigns;
  - ✓ historical reconstructions;
  - ✓ science illustrations;
  - ✓ storyboards; and
  - ✓ design projects.

  The educational objective should not simply be to produce an attractive AI-generated image. Students should explain the ideas behind the design, make creative decisions, modify the output, and document their process.

  ❖ AI and Problem Solving: Students can use AI to explore several possible solutions to real-life problems. Teachers can then ask students to compare AI-generated solutions with their own solutions.

  This creates opportunities for:

  generation → comparison → evaluation → modification → innovation.

  Such activities can strengthen higher-order thinking while reducing the possibility that AI becomes merely a shortcut.

Relationship between AI and Creativity among Secondary Students

The relationship between AI and creativity can be represented through three broad possibilities.

- Model 1: AI as a Creative Stimulus
  - ❖ AI provides prompts and alternative possibilities.
  - ❖ Result: Student generates more ideas.
- Model 2: AI as a Creative Collaborator
  - The student and AI interact iteratively.
  - Result: Student evaluates, modifies, combines, and develops ideas.
- Model 3: AI as a Creative Substitute
  - The student delegates most of the creative task to AI.

- Result: Reduced independent thinking and potentially weaker ownership of the final product. Therefore, the educational effect of AI depends more on how students use AI than merely on whether AI is available.

6. **Opportunities of AI for Developing Creativity**

- **Increased Idea Generation**: AI can rapidly produce multiple possibilities, helping students overcome the initial difficulty of starting a creative task.
- **Individualized Creative Support:** Students with different levels of prior knowledge can request explanations or examples at different levels of complexity.
- **Multimodal Creativity:** AI can connect text, images, audio, coding, and other forms of representation. This can enable students to express ideas in multiple ways.
- **Immediate Feedback:** Students can obtain feedback during drafting and revision. Teachers can encourage students to critically evaluate that feedback rather than automatically accept it.
- **Interdisciplinary Creativity:** AI can help students connect concepts from science, mathematics, social science, language, art, and technology.
- **Collaborative Creativity:** Students can work in groups to evaluate AI-generated suggestions, identify weaknesses, and construct better solutions.

Challenges and Risks

AI also presents significant risks to the development of creativity among secondary school students.

1 Dependence on AI: If students repeatedly ask AI to produce complete answers, stories, essays, designs, or solutions, they may become dependent on the technology.

2 Reduction in Original Thinking: When many students use similar AI prompts and accept similar outputs, their work may become increasingly standardized.

3 Loss of Student Voice: Creative writing, artwork, project design, and personal reflection are valuable partly because they represent the student's own experiences and perspectives. Excessive AI involvement may weaken this personal dimension.

4 Academic Integrity: Students may submit AI-generated work without acknowledging the use of AI or without making meaningful contributions themselves.

5 Accuracy and Bias: AI-generated information can contain errors, stereotypes, misleading claims, or inappropriate assumptions. Students therefore require strong critical-evaluation skills.

6 Privacy: Educational institutions must consider what student information is entered into AI systems. UNESCO's guidance emphasizes privacy protection and a human-centred approach to the educational use of generative AI.

7 Inequality of Access: Students may have different levels of access to devices, internet connectivity, paid AI services, and digital support. This can create new educational inequalities.

8 Cognitive Dependence: Recent K–12 research has raised concerns about cognitive dependence and erosion of creative authorship when GenAI is used without appropriate educational safeguards. The evidence supports the importance of process-focused assessment, AI literacy, scaffolding, and teacher guidance.

Role of Teachers

The teacher remains central to creative learning in an AI-supported classroom.

Teachers should:

- ✓ Establish clear rules for appropriate ai use;
- ✓ Teach students how ai systems work at an age-appropriate level;
- ✓ Encourage students to generate their own ideas before consulting ai;
- ✓ Require students to verify ai-generated information;
- ✓ Assess the learning process rather than only the final product;
- ✓ Encourage reflection on ai-generated suggestions;
- ✓ Promote group discussion and peer evaluation;
- ✓ Teach copyright, attribution, privacy, and ethical use;
- ✓ Design tasks that require personal experiences and original decisions; and
- ✓ Use ai as a scaffold rather than a replacement for student thinking.

Proposed Pedagogical Model

A useful classroom model for developing creativity with AI can be called the HUMAN–AI Creative Learning Model.

- ❖ Stage 1: Human Thinking: Students independently identify the problem and generate their initial ideas.
- ❖ Stage 2: AI Exploration: Students use AI to obtain alternative perspectives, questions, examples, or possibilities.
- ❖ Stage 3: Critical Evaluation: Students examine the AI responses for:
  - ✓ Accuracy;
  - ✓ Relevance;
  - ✓ Originality;
  - ✓ Bias;
  - ✓ Feasibility; and
  - ✓ Ethical concerns.
- ❖ Stage 4: Human Modification: Students reject, combine, adapt, or improve the AI suggestions.
- ❖ Stage 5: Creative Production: Students produce their own final product.
- ❖ Stage 6: Reflection: Students explain:
  - ✓ What was my original idea?
  - ✓ How did AI influence my thinking?
  - ✓ Which AI suggestions did I reject?
  - ✓ Which suggestions did I modify?

- ✓ What decisions did I make independently?
- ✓ What did I learn from the process?
- ✓ This model places human creativity before and after AI interaction.

Suggested Research Methodology for an Empirical Study

A future empirical study can be conducted among secondary school students using a quasi-experimental design.

- ❖ **Research Design**- A pre-test–post-test control group design may be used.
- ❖ **Population:** The population may consist of secondary school students studying in Classes VIII–X or IX–XII, depending on the educational board and research objectives.
- ❖ **Sample:** A sample of approximately 100–200 secondary school students may be selected from selected schools using an appropriate sampling procedure.
  - o Experimental group: 50–100 students
  - o Control group: 50–100 students
- ❖ **Experimental Intervention**- The experimental group may participate in structured AI-supported creative activities for 4–8 weeks.
  - o Activities could include:
  - o Creative writing;
  - o Problem-solving;
  - o Visual design;
  - o Science innovation projects;
  - o Storytelling;
  - o Environmental projects;
  - o Coding challenges; and Interdisciplinary STEAM activities.

The control group may receive conventional creative-learning activities without generative AI.

- ❖ **Tools for Data Collection**:- The following tools may be considered:
  - Creativity test;
  - AI-use questionnaire;
  - Student interview schedule;
  - Teacher observation schedule;
  - Creative-project assessment rubric; and
  - Student reflection journal.

  A standardized creativity measure such as an appropriate version of the Torrance Tests of Creative Thinking may be considered, subject to licensing, cultural adaptation, and researcher permissions. The TTCT includes verbal and figural components and assesses several dimensions associated with creative thinking.

Variables

- ➢ Independent Variable: AI-supported learning

- Dependent Variable: Creativity
- Possible dimensions of creativity:
  - fluency;
  - flexibility;
  - originality;
  - elaboration.
- Possible moderating variables:
  - gender;
  - age;
  - previous academic achievement;
  - digital literacy;
  - AI experience;
  - socioeconomic background;
  - school type; and teacher support.

Statistical Techniques

The following statistical techniques may be used:

- ✓ Mean;
- ✓ Standard deviation;
- ✓ Percentage;
- ✓ t-test;
- ✓ ANCOVA;
- ✓ correlation;
- ✓ regression analysis; and
- ✓ effect-size analysis.

Qualitative student interviews and reflections may be analyzed using thematic analysis.

Research Questions

1. The following research questions are proposed:
2. What is the level of creativity among secondary school students?
3. How do secondary school students use AI for creative learning activities?
4. Does AI-supported learning influence students' creative thinking?
5. What is the effect of AI-supported learning on fluency, flexibility, originality, and elaboration?
6. What challenges do students experience while using AI for creative tasks?
7. How does teacher guidance influence the relationship between AI use and creativity?
8. What ethical concerns arise from the use of AI in students' creative work?

Hypotheses: The following null hypotheses may be tested:

- ✓ H_{01}: There is no significant difference in the creativity scores of secondary school students who participate in AI-supported learning and those who participate in conventional learning.

- ✓ H_{02}: There is no significant difference between experimental and control groups in fluency.
- ✓ H_{03}: There is no significant difference between experimental and control groups in flexibility.
- ✓ H_{04}: There is no significant difference between experimental and control groups in originality.
- ✓ H_{05}: There is no significant difference between experimental and control groups in elaboration.
- ✓ H_{06}: There is no significant relationship between students' responsible use of AI and their creativity scores.

Review-Based Findings

The emerging literature suggests that the relationship between AI and creativity is conditional rather than automatic.

First, generative AI can support creativity by expanding the number of possibilities available to learners. Recent meta-analytic evidence from quasi-experimental research found an overall moderate positive effect of GenAI-assisted learning on creativity. However, the authors also identified meaningful differences depending on instructional and contextual factors.

Second, the literature indicates that pedagogical design matters considerably. AI is more likely to support creativity when students are required to question, compare, evaluate, revise, and personalize AI-generated material rather than simply copy it.

Third, current evidence specifically concerning secondary-school students remains less extensive than evidence from higher education. In the 2026 meta-analysis, only 11.76% of participants came from middle-school contexts, while the large majority were university students.

Fourth, recent K–12 literature highlights the possibility that poorly structured GenAI use may contribute to dependence and weaken creative authorship. This reinforces the importance of process-based assessment and human agency.

Finally, UNESCO's student competency framework places creativity within a broader model of responsible AI use, emphasizing that students should develop the capacity to understand, apply, and create with AI while maintaining ethical and human-centred perspectives.

Educational Implications

For Students

- Students should be encouraged to:
- think independently before using AI;
- use AI for brainstorming rather than copying;
- verify AI-generated information;
- maintain their own voice;
- acknowledge AI assistance where required;
- compare multiple possibilities;

- modify AI suggestions creatively; and
- reflect on their AI-supported learning process.

For Teachers

- Teachers should develop:
- AI-supported creative lesson plans;
- process-based assessments;
- AI literacy activities;
- ethical-use guidelines;
- project-based learning;
- collaborative creative tasks; and
- reflection-based assignments.

For Schools

- Schools should develop clear policies concerning:
- acceptable AI use;
- student privacy;
- assessment;
- academic integrity;
- AI literacy;
- teacher training; and
- equitable access.

For Curriculum Developers

- Creativity and AI literacy should not be treated as separate areas. Students need opportunities to develop both creative thinking and critical AI literacy.

Ethical Considerations

The use of AI among secondary school students requires special attention because students are minors or young learners.

- ✓ Important ethical principles include:
- ✓ protection of student data;
- ✓ age-appropriate AI use;
- ✓ informed institutional policies;
- ✓ transparency about AI assistance;
- ✓ respect for copyright;
- ✓ prevention of discrimination and bias;
- ✓ equitable access;
- ✓ preservation of student authorship; and human oversight.

Limitations

This paper is primarily a conceptual and literature-based research paper. It does not claim to present original experimental data collected from secondary school students. Therefore, conclusions about causal effects should be interpreted cautiously.

Another limitation is that generative AI technologies are developing rapidly. Findings concerning a particular AI tool may not remain fully applicable as models, educational policies, and classroom practices evolve.

Furthermore, much of the recent empirical literature concerns university students rather than secondary students. Consequently, there is a need for more longitudinal and school-based research involving adolescents.

Suggestions for Further Research

- Future researchers may investigate:
- the long-term influence of AI on adolescent creativity;
- differences between AI-assisted and non-AI-assisted creative learning;
- gender differences in AI-supported creativity;
- rural and urban differences;
- government and private school contexts;
- AI use in art education;
- AI-supported creative writing;
- AI and STEM/STEAM creativity;
- AI and creative problem-solving;
- teacher AI literacy and student creativity;
- creative self-efficacy and AI;
- ethical AI literacy among adolescents; and longitudinal effects of AI dependence on creative thinking.

Conclusion

Artificial Intelligence has the potential to transform creative learning among secondary school students, but technology alone does not create creativity. AI can provide prompts, alternative perspectives, feedback, examples, and opportunities for experimentation. These functions can stimulate fluency, flexibility, originality, elaboration, and problem-solving when students remain actively involved in the creative process. At the same time, excessive dependence on AI may weaken independent idea generation, student voice, authorship, and productive cognitive effort. Contemporary evidence therefore supports a balanced approach in which AI is integrated as a creative scaffold and collaborative partner rather than a substitute for human thinking. The most appropriate educational goal is not to prevent students from using AI, nor to allow unrestricted dependence on it. Instead, schools should teach students how to think with AI without allowing AI to think for them. The future of creative education should therefore combine human imagination, critical thinking, ethical awareness, subject knowledge, and responsible AI use.

REIMAGINING TEACHER EDUCATION AND PROFESSIONAL DEVELOPMENT IN THE AGE OF ARTIFICIAL INTELLIGENCE: COMPETENCIES, PEDAGOGIES AND EMERGING CHALLENGES

Dr. Chidananda N K
Principal, National College of Education, Shivamogga.

Abstract

Artificial Intelligence (AI) is rapidly transforming educational institutions, teaching practices, curriculum design, assessment and professional learning. While considerable attention has been given to the potential of AI to enhance student learning, comparatively less attention has been directed toward the preparation and professional development of teachers who are expected to implement these technologies responsibly. The emergence of generative artificial intelligence (GenAI), large language models and AI-powered educational platforms has further intensified the need to reconsider the knowledge, skills, values and professional identities required of teachers. This conceptual review examines the changing landscape of teacher education and professional development in the age of AI. Drawing upon recent systematic reviews, international policy frameworks and established scholarship on teacher professional learning and technological pedagogical knowledge, the paper analyses the emerging concept of teacher AI competency, the role of AI in pre-service and in-service teacher education, AI-supported professional development, pedagogical integration, ethical literacy and the changing professional identity of teachers. The literature indicates that effective AI integration cannot be achieved through technical training alone. Teachers require integrated technological, pedagogical, disciplinary, ethical and reflective competencies. Recent research further indicates that teacher professional development remains underrepresented within the broader AI-in-education literature, despite the centrality of teachers to successful implementation. The paper proposes a Human-Centred AI Competency Framework for Teacher Education comprising six interconnected dimensions: AI literacy, pedagogical integration, ethical and critical literacy, assessment literacy, professional learning and human agency. The paper argues that AI should augment rather than replace teachers and that teacher education institutions must shift from technology-oriented training toward sustained, practice-based and reflective professional learning. The review concludes that the success of AI in education will depend substantially on whether teachers are prepared not merely to use AI tools but to exercise professional judgement concerning when, why and under what conditions AI should be used.

Keywords: *Artificial Intelligence, Generative AI, Teacher Education, Teacher Professional Development, AI Competency, AI Literacy, Teacher Identity, Pedagogical Knowledge, Human-Centred AI*

1. Introduction

Artificial Intelligence has become one of the most influential technological developments affecting contemporary education. The rapid emergence of generative AI systems capable of producing text, images, presentations, lesson plans, assessment materials and other

educational resources has expanded the role of AI from a specialized technological application to a widely accessible educational resource. Consequently, the relationship among teacher, learner and technology is undergoing significant transformation.

Earlier applications of AI in education included intelligent tutoring systems, adaptive learning platforms, automated assessment, predictive analytics and learner profiling. These systems were primarily designed to support student learning or institutional decision-making. The emergence of generative AI has created a new dimension because teachers themselves can interact directly with AI systems to plan lessons, generate resources, analyse learner responses, develop assessment tasks and support professional learning.

This transformation has important implications for teacher education. Teachers can no longer be prepared solely for a conventional classroom environment in which information is transmitted from teacher to learner. They must increasingly work in educational environments characterized by human-AI interaction, abundant digital information and rapidly changing technological capabilities.

Zawacki-Richter et al. (2019), in an influential systematic review of AI applications in higher education, observed that educators were comparatively underrepresented in AI research. Their observation remains significant because the educational value of AI ultimately depends on the decisions of teachers and educational institutions. Recent evidence reinforces this concern. Tan et al. (2025) reviewed 95 studies published between 2015 and 2024 and found that 65% focused on AI applications in teaching, whereas only 35% examined AI in teacher professional development.

This imbalance indicates that research has often focused on what AI can do for education rather than what teachers need to know and do in order to use AI effectively. The present review therefore focuses on teacher education and professional development as a foundational condition for responsible AI integration.

2. Artificial Intelligence and the Changing Nature of Teaching

Teaching has traditionally involved the organization of knowledge, explanation of concepts, classroom management, assessment, feedback and support for learners. AI does not eliminate these functions, but it can modify how teachers perform them.

Generative AI can assist teachers in preparing instructional materials, producing examples, differentiating content, generating assessment questions and providing preliminary feedback. Learning analytics can help teachers identify patterns in learner engagement and performance. Adaptive systems can provide information concerning individual learner progress.

These capabilities may reduce some routine workload and allow teachers to devote greater attention to higher-level pedagogical activities. Luckin and Cukurova (2019) argue that AI should be understood in relation to the human intelligence that teachers and learners bring to educational environments rather than as a substitute for it.

The teacher's role may therefore gradually shift from being primarily a transmitter of information toward being a learning designer, facilitator, mentor, evaluator and ethical

mediator. Such transformation requires professional learning that addresses not only technological operation but also pedagogical judgement.

3. The Concept of Teacher AI Competency

AI competency refers to the knowledge, skills, attitudes and values required to understand, evaluate and use AI appropriately.

For teachers, AI competency is more complex than general digital literacy. Digital literacy enables teachers to use digital tools. AI competency additionally requires an understanding of how AI systems generate outputs, how their limitations influence educational decisions and how AI should be integrated with pedagogical objectives.

UNESCO's *AI Competency Framework for Teachers* identifies 15 competencies across five dimensions: a human-centred mindset, ethics of AI, AI foundations and applications, AI pedagogy, and AI for professional learning. These competencies are organized across progressive levels of acquisition, deepening and creation.

The framework is significant because it moves beyond a narrow conception of AI training. Teachers are expected not merely to operate AI tools but to understand their ethical, pedagogical and professional implications. This approach suggests that teacher AI competency should be regarded as a multidimensional professional competency rather than a technical skill.

4. AI Literacy in Teacher Education

AI literacy has emerged as an important area of educational research. However, research specifically focused on AI literacy within teacher education remains relatively limited. Moser et al. (2024), in a scoping review of 34 studies, found that AI literacy was emerging globally but remained comparatively underdeveloped within teacher education. The review also identified a strong emphasis on technical knowledge, while teachers' practical and ethical professional knowledge received less attention. This finding has important implications for teacher education institutions.

A teacher who understands how to operate an AI chatbot but cannot determine whether its response is pedagogically appropriate is not fully AI competent. Similarly, a teacher who can generate lesson plans with AI but cannot identify hallucinations, bias, privacy risks or culturally inappropriate content requires further professional preparation. AI literacy must therefore include technical understanding, critical evaluation, pedagogical application and ethical judgement.

5. AI and Pre-Service Teacher Education

Pre-service teacher education represents the foundation for developing future teachers' professional competencies. Teacher education programmes should therefore introduce AI before student teachers enter professional practice. AI can be integrated across educational psychology, pedagogy, curriculum studies, assessment, educational technology and research methodology.

For example, student teachers can use AI to generate alternative instructional strategies and

then critically evaluate their pedagogical suitability. They can compare AI-generated lesson plans with established instructional models and identify strengths and weaknesses. They can also examine AI-generated assessment items for validity, reliability, cognitive level and inclusiveness.

This approach transforms AI from an isolated technology subject into a cross-curricular professional competency. Recent research supports this direction. Khalid et al. (2026), in a systematic review of AI-integrated professional development for pre-service teachers, found that effective AI professional development should extend beyond technical skills and contribute to adaptable, innovative and ethically informed teacher identities. The implication is that AI should be embedded within the professional formation of teachers rather than introduced merely as an optional digital tool.

6. AI and In-Service Teacher Professional Development

In-service teachers face an especially demanding situation because AI technologies are developing faster than many existing professional development programmes. Teachers who completed their formal education before the emergence of generative AI may have had limited opportunities to develop AI-related competencies. Professional development therefore needs to become continuous rather than episodic. A one-day workshop may introduce teachers to several AI tools, but it is unlikely to develop deep pedagogical competence. Effective professional development should involve sustained practice, reflection, collaboration, experimentation and feedback.

Tan et al. (2025) identified a substantial imbalance between research on AI in teaching and AI for teacher professional development, highlighting the need for greater attention to teachers' developmental needs. This gap is particularly significant because technological knowledge becomes obsolete quickly. Professional learning must therefore emphasize transferable principles rather than dependence on particular software platforms.

7. From Technical Training to Pedagogical AI Professional Development

A major weakness in technology-oriented professional development is the assumption that learning how to operate a tool automatically leads to effective classroom integration. Pedagogically meaningful AI integration requires teachers to understand the relationship between technology, pedagogy and subject content.

This principle is consistent with the Technological Pedagogical Content Knowledge framework developed by Mishra and Koehler (2006). TPACK emphasizes that effective technology integration emerges from the interaction among technological knowledge, pedagogical knowledge and content knowledge. AI creates a need to extend this thinking toward AI-TPACK, in which teachers understand how AI capabilities interact with particular subject matter, pedagogical strategies and learner characteristics.

For example, the appropriate use of AI in mathematics education may differ substantially from its use in history, science, language education or teacher education. Professional development should therefore be subject-sensitive.

8. AI-Supported Professional Learning

AI is not only a subject of teacher professional development; it can also become a mechanism for professional learning. Teachers may use AI to obtain explanations, generate examples, compare instructional strategies, analyse lesson plans and reflect on teaching decisions. Li et al. (2025) reviewed 16 studies of AI-integrated teacher professional development and found that existing programmes frequently used AI to provide data-informed and personalized support while maintaining teachers' agency in the interaction. This suggests the possibility of a new model of professional learning in which teachers interact continuously with AI-supported professional learning environments. However, AI should not become the sole source of professional advice. Teachers need opportunities for collaboration with colleagues, mentors, teacher educators and professional communities. AI can extend professional learning, but human professional communities remain essential.

9. AI and Reflective Practice

Reflective practice is central to effective teacher development. Teachers improve when they critically examine their instructional decisions, classroom interactions and learner responses. AI can potentially support reflection by analysing lesson plans, identifying alternative strategies or generating questions that encourage teachers to examine their assumptions.

For example, after teaching a lesson, a teacher could use an AI system to organize classroom observations and generate possible interpretations. The teacher could then compare these interpretations with actual classroom evidence.

However, reflection should not become algorithmically determined. AI may suggest an interpretation, but teachers must evaluate whether that interpretation corresponds with the actual classroom context. AI-supported reflection should therefore strengthen professional judgement rather than replace it.

10. AI and Teacher Creativity

Teaching requires considerable creativity. Teachers design examples, activities, explanations, questions and learning experiences according to learner needs. Generative AI can potentially increase teachers' creative capacity by rapidly producing alternatives. A teacher may request several examples of a concept, different classroom activities or multiple ways of explaining difficult content. This can reduce preparation time and expand instructional possibilities.

Nevertheless, excessive dependence on AI may lead to standardization. If teachers use identical AI-generated materials without contextual adaptation, educational experiences may become less distinctive. Teacher creativity therefore remains essential. The appropriate model is AI-assisted creativity, in which AI generates possibilities while teachers select, modify and contextualize them.

11. AI and Differentiated Instruction

One of the most promising applications of AI for teachers is differentiated instruction. Teachers frequently need to adapt learning resources for students with different levels of readiness, language proficiency, learning pace and educational needs. AI can generate

alternative versions of instructional content, provide additional examples and create questions at different cognitive levels. This may reduce teacher workload while enabling greater instructional differentiation.

However, AI-generated differentiation must be evaluated by teachers. A system may simplify content so extensively that important disciplinary concepts are lost. It may also generate examples that are culturally inappropriate or inaccessible to particular learners. Teacher judgement therefore remains indispensable.

12. AI and Assessment Literacy

AI is also changing teachers' assessment responsibilities. Generative AI challenges conventional assignments because students can increasingly obtain assistance in producing written responses and other academic outputs. Teachers consequently need to develop new assessment strategies emphasizing authentic performance, oral defence, portfolios, process documentation and reflective tasks. AI can assist teachers in generating assessment questions and providing preliminary feedback, but high-stakes evaluation should retain human oversight. Teacher professional development must therefore integrate AI literacy with assessment literacy. A teacher who knows how to use AI but continues to employ assessment methods that no longer provide valid evidence of student learning has not achieved meaningful AI integration.

13. AI, Ethics and Professional Responsibility

The use of AI introduces new ethical responsibilities for teachers. Teachers must consider privacy, bias, transparency, intellectual property, misinformation and academic integrity. UNESCO's framework emphasizes human agency, ethical principles and teachers' professional responsibilities in AI-supported education. Ethical AI literacy should therefore be embedded in teacher preparation.

Teachers should understand that AI-generated content can contain factual errors, fabricated references, stereotypes and inappropriate recommendations. They must also recognize that AI systems may process learner information in ways that create privacy concerns. Professional competence therefore includes the capacity to determine not only how to use AI, but also when not to use AI.

14. AI and Teacher Agency

Teacher agency refers to teachers' capacity to exercise professional judgement and influence their work. AI can either strengthen or weaken teacher agency. It can strengthen agency by reducing routine tasks and providing additional information. However, it may weaken agency if teachers become dependent on algorithmic recommendations or if institutions impose AI systems without adequate teacher participation. UNESCO's human-centred framework explicitly emphasizes human agency as a foundational principle.

AI implementation should therefore involve teachers in decision-making concerning technology selection, classroom integration and evaluation. Teachers should be treated as professional partners in technological transformation rather than as passive recipients of

technological policies.

15. AI and Teacher Identity

Technological change can influence professional identity. Teachers may initially perceive AI as a threat to professional expertise, particularly when AI systems can generate explanations, lesson plans and instructional resources. However, the long-term professional significance of AI may involve redefining rather than eliminating teacher expertise. If information becomes increasingly abundant and easily generated, the teacher's value increasingly lies in interpretation, judgement, relationship-building, ethical reasoning and pedagogical design. Thus, AI may shift teacher identity from knowledge transmitter toward learning architect and professional mediator. Teacher education programmes should prepare teachers for this transformation rather than presenting AI solely as a technological challenge.

16. Challenges in AI Professional Development

Several challenges limit the effectiveness of current AI professional development.

a) The first challenge is the rapid pace of technological change. Professional development programmes can quickly become outdated.
b) The second is the tendency to emphasize technical skills over pedagogical integration.
c) The third is unequal access to training. Teachers working in under-resourced institutions may have fewer opportunities to experiment with AI.
d) The fourth is uncertainty concerning institutional policies.
e) The fifth concerns teacher attitudes. Some teachers may perceive AI as a threat, while others may adopt it uncritically.

A 2024 systematic review of teacher AI training identified challenges involving teacher preparedness, training design and the broader conditions necessary for effective AI integration. These findings indicate that professional development cannot be treated as an isolated workshop. It requires organizational support.

17. Organizational Conditions for Successful AI Integration

Teacher competence alone cannot guarantee successful AI adoption. Schools and colleges need supportive organizational conditions. Leadership must establish clear expectations concerning responsible AI use. Teachers require access to appropriate technologies, technical support and time for experimentation. Professional learning communities can provide opportunities for teachers to share experiences, develop common practices and evaluate AI applications collaboratively. Recent research on AI professional development indicates that many programmes focus primarily on individual outcomes rather than broader organizational change. Li et al. (2025) identify this as an important area requiring further attention. This suggests that AI professional development should operate at multiple levels: individual, collegial, institutional and policy.

18. AI and Teacher Education Institutions

Teacher education institutions have a strategic responsibility in preparing educators for AI-mediated learning environments. Universities and colleges of education should reconsider

their curricula to incorporate AI across teacher education rather than confining it to educational technology courses.

Teacher educators themselves require professional development. The challenge is therefore recursive: teacher educators must be prepared to prepare teachers for AI. The curriculum should incorporate AI literacy, AI pedagogy, assessment redesign, ethics, accessibility, data literacy and reflective practice. Teacher education institutions should also establish AI laboratories or innovation environments where student teachers can experiment with AI-supported pedagogy. Such environments can connect theoretical knowledge with practical classroom application.

19. A Human-Centred AI Competency Framework for Teachers

Based on the reviewed literature, this paper proposes a Human-Centred AI Competency Framework consisting of six interrelated dimensions.

a) The first dimension is AI Literacy, involving understanding AI concepts, capabilities, limitations and applications.
b) The second dimension is AI Pedagogical Integration, involving the ability to align AI tools with curriculum objectives, teaching methods and learner characteristics.
c) The third dimension is Critical and Ethical AI Literacy, involving evaluation of bias, misinformation, privacy, transparency, intellectual property and responsible use.
d) The fourth dimension is AI Assessment Literacy, involving the redesign of assessment, interpretation of AI-generated analytics and development of authentic assessment practices.
e) The fifth dimension is AI-Supported Professional Learning, involving the use of AI for reflection, resource development, research and continuous professional development.
f) The sixth dimension is Human Agency and Professional Judgement, involving teachers' capacity to make independent pedagogical and ethical decisions.

20. Implications for Pre-Service Teacher Education

a) Teacher education curricula should provide structured opportunities for student teachers to develop AI competency.
b) AI should be embedded into pedagogical courses, curriculum studies, educational psychology, assessment and educational technology.
c) Student teachers should also engage in critical analysis of AI-generated educational content.
d) Teaching practice programmes should encourage student teachers to document their use of AI, analyse its benefits and limitations, and reflect on its influence on their pedagogical decisions.
e) Such experiences can prevent the development of either uncritical enthusiasm or blanket resistance toward AI.
f) The desired outcome is informed professional judgement.

21. Implications for In-Service Professional Development

a) Professional development should move from short-term tool demonstrations toward sustained learning.
b) Teachers require opportunities to experiment with AI in authentic classroom contexts and subsequently reflect on outcomes.
c) Collaborative lesson design, peer observation, mentoring and professional learning communities can strengthen this process.
d) AI can also support personalized professional learning by providing resources according to teachers' individual knowledge and needs.
e) Li et al. (2025) found that AI-integrated professional development frequently incorporated personalized and data-informed support, suggesting significant potential for adaptive teacher learning.
f) However, personalization should complement rather than replace collegial professional learning.

22. Implications for Educational Policy

a) National and institutional policies should establish teacher AI competency standards.
b) UNESCO's 2024 framework provides an international reference point for developing such standards.
c) Policy should support continuous professional development, equitable access to AI tools, ethical governance and teacher participation in technology-related decision-making.
d) For countries such as India, policy must also address multilingualism, rural-urban disparities, infrastructure limitations and the diversity of educational institutions.
e) The objective should be responsible and equitable AI adoption rather than rapid technological adoption for its own sake.

23. Research Gaps

The literature reveals several important gaps.

a) Research remains disproportionately focused on AI applications for students rather than AI-enabled professional development for teachers. Tan et al. (2025) identified this imbalance across 95 studies.
b) Research on AI literacy in teacher education is also comparatively limited. Moser et al. (2024) identified a lack of sufficient attention to teachers' practical and ethical knowledge.
c) Further, many professional development studies use small samples and short intervention periods. Recent reviews have also noted the underrepresentation of in-service teachers and concerns about limited sample sizes in the emerging GenAI teacher-development literature.
d) Future research should therefore examine long-term changes in teacher competence, classroom practice, professional identity and student learning.

e) More research is also required in developing countries and multilingual contexts.

24. Future Directions

The future of AI in teacher education should emphasize professional augmentation rather than professional replacement.

a) AI can reduce routine workload and provide teachers with new forms of instructional and professional support. However, teachers must retain responsibility for educational goals, learner relationships and ethical decisions.
b) Professional development should increasingly adopt a continuous model in which teachers learn, experiment, reflect and collaborate.
c) Teacher education institutions should also establish partnerships with schools, technology developers and educational researchers to ensure that AI systems respond to authentic educational needs.
d) Future AI competency frameworks should remain flexible because AI technologies will continue to evolve.
e) The most durable competencies will therefore be critical thinking, ethical reasoning, pedagogical judgement, adaptability and lifelong learning.

25. Conclusion

Artificial Intelligence is changing the nature of teaching and creating an urgent need to rethink teacher education and professional development. The evidence indicates that AI integration cannot be achieved through technical training alone. Teachers require a combination of technological, pedagogical, disciplinary, ethical, assessment and reflective competencies. Recent systematic reviews demonstrate that research on AI in teaching has expanded much faster than research on AI for teacher professional development, revealing an important gap in the field. Other reviews show that effective AI professional development increasingly emphasizes teacher agency, personalized support and pedagogical integration. UNESCO's competency framework provides an important international foundation by positioning human-centred thinking, ethics, AI foundations, AI pedagogy and professional learning at the centre of teacher preparation. The future teacher will not necessarily be the person who knows the most information. Increasingly, the teacher will be the professional who can evaluate information, design meaningful learning experiences, interpret AI-generated evidence, support diverse learners and make responsible decisions concerning technology. Consequently, AI should not be understood as a technology that diminishes the importance of teachers. Properly integrated, it can make teachers more capable of focusing on the dimensions of education that require distinctly human judgement. eacher education must therefore move from training teachers to use AI tools toward developing teachers who can think pedagogically and ethically about AI. The ultimate objective is not technological sophistication but professional empowerment. A sustainable model of AI-enabled education requires teachers who are technologically informed, pedagogically capable, ethically responsible, critically reflective and confident in exercising professional agency. The future of

education will consequently depend not simply on increasingly powerful AI systems, but on increasingly capable teachers who know how to use those systems wisely.

PROFESSIONAL DEVELOPMENT: TRENDS AND CHALLENGES IN TEACHER EDUCATION.

Dr. Sharana Nayaka
Assistant Professor, National College of Education, Shivamogga.

Abstract

Teacher education and professional development are fundamental to the preparation, competence, and continuous growth of teachers. In the contemporary educational environment, teachers are expected to perform multiple roles and respond effectively to technological advancement, curriculum reforms, diverse learner needs, inclusive education, and changing expectations of society. Teacher education provides the foundational knowledge, pedagogical skills, professional values, and competencies required for entry into the teaching profession, whereas professional development enables teachers to continuously update and strengthen these competencies throughout their careers. The present review paper examines the relationship between teacher education and professional development and their contribution to teacher effectiveness and quality education. It discusses the concept and importance of teacher education, the nature and characteristics of effective professional development, the role of digital technology in professional learning, major challenges faced by teachers, and emerging trends in teacher professional development. Recent research suggests that well-designed professional development can improve teachers' instructional practices and contribute positively to student learning outcomes. However, the effectiveness of professional development depends upon factors such as content focus, active learning, collaboration, coaching, feedback, reflection, duration, and institutional support. The paper further discusses the implications of the National Education Policy (NEP) 2020 for teacher education and continuous professional development in India. It argues that teacher education should be viewed as a continuous professional learning process rather than a one-time qualification. Strengthening the connection between pre-service teacher education and continuing professional development can contribute to the development of competent, reflective, digitally capable, inclusive, and effective teachers and ultimately promote quality education.

Keywords*: Teacher Education, Professional Development, Teacher Effectiveness, Professional Learning, Teacher Competence, Digital Competence, Quality Education, NEP 2020*

Introduction

Education is one of the most important instruments for the intellectual, social, emotional, and economic development of individuals and society. Within the educational system, teachers occupy a central position because they directly influence classroom teaching, student engagement, learning experiences, and the development of learners. The quality of education therefore depends substantially upon the competence, commitment, knowledge, skills, and professional practices of teachers. In this context, teacher education and professional

development have become important areas of educational policy, research, and practice.

The role of teachers has changed considerably in recent years. Teachers are no longer expected merely to transmit information to students. They are required to act as facilitators, mentors, counsellors, classroom managers, assessors, researchers, innovators, and users of digital technologies. The emergence of artificial intelligence, online learning, digital educational resources, competency-based education, inclusive education, and learner-centred pedagogies has further expanded teachers' professional responsibilities. Teacher education provides the foundation for entering the teaching profession. It develops prospective teachers' understanding of educational psychology, pedagogy, curriculum, assessment, classroom management, subject matter, and professional ethics. However, initial teacher education alone cannot prepare teachers for every challenge they may encounter throughout their professional careers. Educational knowledge and practices continue to evolve, making continuous professional learning essential. Professional development refers to the continuous process through which teachers acquire new knowledge, develop professional competencies, reflect upon their practices, collaborate with colleagues, and improve classroom instruction. It may occur through workshops, seminars, refresher courses, mentoring, coaching, professional learning communities, action research, online courses, webinars, peer observation, and other formal and informal learning opportunities. Recent research has increasingly emphasized the importance of viewing teacher education and professional development as interconnected components of a professional learning continuum. Effective teacher development should begin during pre-service preparation and continue through induction and the entire teaching career. Thus, teacher education should not be considered complete when a teacher obtains a professional qualification. Instead, it should establish the foundation for lifelong professional learning.The present paper reviews the role of teacher education and professional development in enhancing teacher effectiveness and quality education, with particular attention to contemporary educational developments and the Indian contex

Concept of Teacher Education

Teacher education refers to the systematic process of preparing individuals for the teaching profession by developing their professional knowledge, skills, attitudes, values, and competencies. It generally includes theoretical understanding as well as practical experiences that enable prospective teachers to connect educational concepts with classroom realities.

Teacher education may include pre-service education, teacher preparation programmes, teaching practice, internships, induction programmes, and continuing education. An effective teacher education programme should provide prospective teachers with opportunities to develop both subject-specific and pedagogical knowledge.

The major purposes of teacher education include:

Developing subject-matter knowledge.

Developing pedagogical competencies.

Understanding learners and their developmental characteristics.

Developing classroom-management skills.
Developing assessment and evaluation competencies.
Promoting inclusive teaching practices.
Developing professional ethics and values.
Developing communication and interpersonal skills.
Preparing teachers to use digital technologies.- Encouraging reflective and research-oriented practice.
Teacher education should therefore focus not only on what teachers know but also on how they use their knowledge in diverse classroom situations.

Concept of Professional Development

Professional development is a continuous process through which teachers enhance their knowledge, skills, attitudes, competencies, and professional practices. It may be formal or informal and can occur individually, collaboratively, within schools, or through external institutions.
Traditional professional development has often been associated with workshops and short-term training programmes. However, contemporary approaches increasingly emphasize sustained and practice-oriented professional learning.
Professional development may include:
1. Workshops and seminars
2. Conferences
3. Refresher courses
4. Mentoring and coaching
5. Peer observation
6. Collaborative lesson planning
7. Professional learning communities
8. Online courses and webinars
9. Action research
10. Reflective practice
11. School-based professional learning
12. Digital and blended learning

The central objective of professional development is to improve teachers' professional capacity and, ultimately, their classroom practice and student learning.

4. Relationship Between Teacher Education and Professional Development

Teacher education and professional development are closely related but represent different stages of teacher learning. Teacher education primarily establishes the foundation for entering the teaching profession, whereas professional development supports continuous growth after teachers enter the profession.
The relationship can be understood as a continuum:
Initial Teacher Education → Teaching Practicum → Induction → Mentoring → Continuous

Professional Development → Professional Learning → Improved Teaching Practice → Teacher Effectiveness → Quality Education

Initial teacher education introduces teachers to fundamental concepts and practices. Once teachers enter schools, they encounter real-world challenges that may not have been fully addressed during their initial preparation. Professional development provides opportunities to address these challenges and acquire new competencies.

Consequently, teacher education and professional development should not operate as completely separate systems. There should be continuity between what teachers learn during their initial preparation and what they subsequently learn through professional development.

5.Teacher Education and Teacher Effectiveness

Teacher effectiveness refers to the ability of teachers to facilitate meaningful learning and contribute to students' academic and overall development. Effective teachers demonstrate strong subject knowledge, appropriate pedagogical skills, classroom-management abilities, effective communication, assessment competence, professional commitment, and the ability to respond to individual learner differences. Teacher education contributes to teacher effectiveness by developing foundational professional competencies. These include:

- Knowledge of subject matter.
- Knowledge of teaching methods.
- Understanding of learner psychology.
- Classroom-management skills.
- Assessment skills.
- Communication skills.
- Inclusive education competencies.
- Digital competence.
- Reflective abilities.
- Problem-solving skills.

Professional development strengthens these competencies by providing opportunities for teachers to learn new approaches and apply them in actual classroom contexts.

Recent evidence provides support for the contribution of professional development to student learning. A 2025 meta-analysis examining 128 high-quality studies found an overall positive effect of teacher professional-development interventions on student achievement. However, the effects varied considerably between programmes, demonstrating that the quality and design of professional development are crucial. Therefore, participation in professional development alone should not be considered sufficient. The effectiveness of a programme depends on whether teachers acquire relevant knowledge, apply it in their classrooms, receive feedback, and receive continued support.

6. Characteristics of Effective Professional Development

Research indicates that professional development is most effective when it is designed around principles of meaningful professional learning.

6.1 Content Focus

Professional development should focus on the content teachers teach and the pedagogical strategies required to teach it effectively. Generic training that is disconnected from teachers' professional needs may have limited impact.

6.2 Active Learning

Teachers should actively engage in professional learning through demonstrations, classroom practice, collaborative activities, lesson planning, problem-solving, and reflection.

6.3 Collaboration

Collaboration enables teachers to share experiences, discuss classroom problems, observe each other's practices, and develop collective solutions.

6.4 Modelling

Professional development should provide teachers with examples or demonstrations of effective teaching practices.

6.5 Coaching and Expert Support

Mentoring and coaching can help teachers implement new practices and overcome difficulties encountered during classroom application.

6.6 Feedback and Reflection

Teachers need opportunities to reflect on their teaching and receive constructive feedback from colleagues, mentors, or professional experts.

6.7 Sustained Duration

Professional development should not be restricted to one-day workshops. Sustained programmes provide teachers with opportunities to learn, practise, receive feedback, and refine their practices.

Darling-Hammond, Hyler, and Gardner identified content focus, active learning, collaboration, modelling, coaching, feedback and reflection, and sustained duration as important characteristics of effective professional development.

7. Digital Technology and Teacher Professional Development

Digital transformation has created new possibilities for teacher professional development. Teachers can now access professional learning opportunities without being physically present at a training centre.

Online professional development can include:

- Webinars
- MOOCs
- Online certification courses
- Virtual workshops
- Digital teacher communities
- Learning management systems
- Online mentoring
- Video-based professional learning

- Digital teaching-resource platforms

Digital professional development is particularly useful because it can provide flexibility and access to experts and resources beyond the local educational environment.

However, technology itself does not guarantee effective professional development. Online programmes must also incorporate active learning, interaction, collaboration, practice, feedback, and reflection.

The development of artificial intelligence has further expanded the possibilities for teacher learning. Teachers may increasingly use AI-supported tools for lesson planning, formative assessment, creation of learning materials, personalized instruction, and professional reflection. At the same time, teachers require appropriate digital and ethical competencies to use such technologies responsibly.

8. Professional Development and Inclusive Education

Contemporary classrooms are characterized by learner diversity. Students may differ in their abilities, socioeconomic backgrounds, languages, learning styles, interests, and educational needs. Teachers therefore require professional competencies to create inclusive learning environments.

Professional development can support teachers in:

- Identifying diverse learning needs.
- Using differentiated instruction.
- Developing accessible learning materials.
- Applying Universal Design for Learning principles.
- Supporting learners with disabilities.
- Managing diverse classrooms.
- Promoting equity and participation.
- Using assistive and digital technologies.

Teacher education programmes should introduce inclusive education during initial preparation, while professional development should provide continuous opportunities to strengthen inclusive teaching practices.

9. NEP 2020 and Teacher Education in India

The National Education Policy (NEP) 2020 recognizes teachers as central to educational transformation in India. It emphasizes improving teacher education, recruitment, professional standards, and continuous professional development.

NEP 2020 promotes a stronger and more multidisciplinary approach to teacher preparation and emphasizes the continuous professional development of teachers. It also gives importance to technology, experiential learning, competency-based education, inclusion, and holistic development.

The policy envisages teachers as professionals who continuously improve their knowledge and skills. Continuous professional development is therefore important for implementing the broader objectives of educational reform.

The emphasis on teacher professional development is particularly significant because educational reforms cannot be effectively implemented without teachers possessing the necessary knowledge and competencies. Curriculum reform, competency-based assessment, experiential learning, vocational education, digital learning, and inclusive education all require teachers to develop new professional capabilities.

10. Challenges in Teacher Professional Development

Despite the importance of professional development, several challenges may reduce its effectiveness.

10.1 Short-Term Training :One-time workshops may provide information but may not result in sustained changes in classroom practice.

10.2 Lack of Follow-Up :

Teachers often require continued mentoring and support after training. Without follow-up, newly acquired practices may not be implemented effectively.

10.3 Disconnect from Classroom Needs

Professional development programmes may sometimes be designed without sufficient consideration of teachers' actual classroom challenges.

10.4 Time Constraints

Teachers may have limited time because of teaching responsibilities, administrative duties, assessment, and other school activities.

10.5 Limited Resources

In some contexts, inadequate technological infrastructure, teaching materials, and institutional resources can restrict professional learning opportunities.

10.6 Limited Collaboration

Professional development becomes less effective when teachers have few opportunities to collaborate and learn from colleagues.

10.7 Inadequate Evaluation

Many programmes focus on attendance or completion rather than examining whether professional development actually changes teaching practices or student outcomes.

10.8 Resistance to Change

Some teachers may be hesitant to adopt unfamiliar pedagogical approaches, particularly when adequate support is unavailable.

These challenges demonstrate the need for systematic planning, implementation, monitoring, and evaluation of professional development programmes.

11. Emerging Trends in Teacher Professional Development

Teacher professional development is gradually shifting from traditional training towards continuous professional learning.

Important emerging trends include:

Traditional Training

↓

Continuous Professional Learning

↓

Collaborative Professional Learning

↓

School-Based Development

↓

Mentoring and Coaching

↓

Digital and Blended Professional Development

↓

Reflective Practice

↓

Evidence-Based Professional Learning

Professional learning communities are particularly promising because they enable teachers to learn collaboratively within their own institutional contexts.

Action research is another important approach because it enables teachers to identify classroom problems, collect evidence, implement interventions, and reflect upon outcomes. Through this process, teachers become active producers of professional knowledge rather than passive recipients of training.

12. Research Gap

Although considerable research has examined teacher education and professional development, several gaps remain. First, many studies examine professional development participation rather than the actual quality of professional learning. Second, there is a need for more research examining how professional development influences teacher effectiveness over longer periods. Third, evidence remains uneven across geographical and educational contexts.

There is also a need to investigate the relationship between professional development and other important teacher-related variables, such as teacher self-efficacy, job satisfaction, psychological well-being, quality of work life, digital competence, motivation, and professional commitment. Further research is particularly required in the Indian school context to understand how teachers experience professional development and which forms of professional learning are most effective for improving teaching quality.

13. Implications for Educational Practice

The review suggests several implications for policymakers, teacher educators, school administrators, and teachers.

1. Teacher education should be viewed as a lifelong professional process.
2. Pre-service teacher education and in-service professional development should be better

integrated.

3. Professional development should be based on teachers' identified needs.

4. Teachers should participate actively in planning professional-learning programmes.

14. Conclusion

Teacher education and professional development are essential for developing an effective and responsive teaching workforce. Teacher education provides the foundation upon which teachers develop their professional knowledge, pedagogical competencies, values, and skills. However, the rapidly changing educational environment makes continuous professional development indispensable. The reviewed literature indicates that effective professional development can positively influence teaching practice and student achievement. However, professional development is not automatically effective simply because teachers participate in training. Its impact depends upon the quality of programme design, relevance of content, active participation, collaboration, modelling, coaching, feedback, reflection, sustained duration, and institutional support. The increasing importance of digital technologies, artificial intelligence, inclusive education, competency-based learning, and curriculum reform further demonstrates the need for continuous teacher learning. In India, the vision of NEP 2020 reinforces the importance of improving teacher education and continuing professional development as part of educational transformation. Therefore, teacher education should be conceptualized as a continuous professional learning continuum extending from initial teacher preparation to lifelong professional development. A shift from isolated training programmes towards sustained, collaborative, reflective, practice-oriented, digitally supported, and evidence-based professional learning can contribute to improved teacher effectiveness and quality education. Ultimately, investment in teacher education and professional development is an investment in the quality of education itself. Competent, reflective, motivated, and continuously developing teachers are essential for creating meaningful learning environments and preparing learners to meet the demands of the twenty-first century.

STUDENT ENGAGEMENT AND WELL-BEING IN THE ERA OF ARTIFICIAL INTELLIGENCE: A HUMAN-CENTRED FRAMEWORK FOR MEANINGFUL LEARNING

Dr. Manju N. D.
Assistant Professor, National College of Education, Shivamogga, Karnataka, India

Abstract

Artificial intelligence (AI), and especially generative artificial intelligence (GenAI), is becoming part of the everyday learning environment. Students can now obtain explanations, receive feedback, generate ideas, translate material, practise skills and communicate with digital systems within seconds. These possibilities can widen access to learning and make support more responsive, but they can also change how students think, interact and regulate their own learning. The key educational issue is therefore not whether students should use AI, but under what conditions AI use contributes to genuine learning, engagement and well-being. This conceptual paper examines the relationship among AI use, student engagement and student well-being through a structured review of contemporary policy and research literature, with particular attention to the OECD Digital Education Outlook 2026, UNESCO's AI Competency Framework for Students and UNESCO's guidance on generative AI in education and research. The discussion is also situated within the National Education Policy (NEP) 2020, which recognizes emerging technologies as important to India's educational future while emphasizing holistic development, critical thinking, access, equity and responsible technology integration. Based on this review, the paper develops a Human-Centred AI Engagement and Well-being Framework with six mutually reinforcing dimensions: meaningful participation, cognitive agency, emotional well-being, social connectedness, ethical and critical AI literacy, and digital balance. The framework treats AI as a scaffold, tutor, feedback partner or creative aid rather than as a replacement for students' intellectual effort, peer relationships or teachers' professional judgement. The paper proposes practical strategies for teaching, assessment, teacher development and institutional policy and concludes that the success of AI-enabled education should be judged by the quality of human learning and development it strengthens, not by the amount of technology used.

Keywords: *Artificial Intelligence, Generative AI, Student Engagement, Student Well-being, AI Literacy, Digital Well-being, Human-Centred Education, NEP 2020, Higher Education, Educational Technology.*

1. Introduction

Artificial intelligence is no longer a distant technological possibility for education. It is increasingly present in the tools students use to search, write, translate, practise, communicate and create. Generative AI has intensified this change because it can respond to natural-language prompts and produce apparently finished products such as explanations, summaries, outlines, code, images and draft assignments. The speed and convenience of these systems create genuine educational opportunities, but they also raise a fundamental question: what

happens to learning when a machine can perform part of the cognitive work that students were previously expected to perform themselves?

The OECD Digital Education Outlook 2026 provides an important distinction. General-purpose GenAI can improve the quality of a student's immediate task performance without necessarily producing equivalent learning gains. When students routinely outsource planning, remembering, reasoning or checking to a chatbot, the visible product may improve while the underlying knowledge and skills remain underdeveloped. At the same time, the OECD identifies evidence that GenAI can support learning when its use is guided by explicit pedagogical purposes and when teachers redesign learning activities around the technology rather than simply adding it to existing tasks (OECD, 2026).

UNESCO adopts a similarly human-centred position. Its AI Competency Framework for Students organizes 12 competencies around four dimensions—human-centred mindset, ethics of AI, AI techniques and applications, and AI system design—and describes progression through understand, apply and create levels (Miao, Shiohira, & Lao, 2024). Such an approach shifts attention from mere tool operation toward judgement, responsibility, creativity and co-creation.

For Indian education, this discussion has particular relevance. NEP 2020 anticipates the influence of emerging technologies, including AI, and calls for technology to improve teaching-learning, assessment, access and teacher development while preparing learners for a changing knowledge landscape (Ministry of Education, 2020). The policy also places strong emphasis on holistic development, higher-order competencies, collaboration, communication, creativity and critical thinking. These priorities provide a useful basis for asking whether AI is strengthening or weakening the human capacities education is intended to develop.

2. Purpose and Objectives of the Paper

The purpose of this conceptual paper is to develop a human-centred perspective on student engagement and well-being in AI-mediated learning environments. The objectives are to:

- examine the major dimensions of student engagement relevant to AI-supported learning;
- analyse potential educational benefits and risks of GenAI for student well-being;
- connect AI literacy with cognitive agency, ethical judgement and responsible participation;
- interpret the implications of NEP 2020 for human-centred AI use in education;
- propose a Human-Centred AI Engagement and Well-being Framework; and
- suggest pedagogical, assessment and institutional measures for meaningful and responsible AI integration.

3. Methodological Approach

The paper is conceptual rather than empirical. It uses a structured narrative review of selected contemporary policy documents and educational literature to identify recurring

themes concerning AI, learning, engagement, well-being, human agency, ethics and digital balance. The principal sources considered are the OECD Digital Education Outlook 2026, UNESCO's AI Competency Framework for Students, UNESCO's Guidance for Generative AI in Education and Research, and India's NEP 2020. These sources were examined comparatively to identify opportunities, risks and design principles that can inform student-centred AI use.

The analysis proceeded in three broad stages: first, identifying the educational affordances and risks associated with GenAI; second, relating those issues to behavioural, emotional and cognitive engagement and to dimensions of student well-being; and third, synthesizing the findings into a proposed framework. The framework is presented as a conceptual model for discussion and future empirical validation; it is not claimed to be an experimentally tested scale or intervention.

4. Understanding Student Engagement in AI-Mediated Learning

Student engagement is more than attendance or visible participation. It concerns the extent to which learners invest attention, effort, emotion and thought in educational activity. In an AI-mediated environment, engagement should be considered across three closely related dimensions.

1. **Behavioural Engagement:** Behavioural engagement is reflected in participation, persistence, concentration, completion of learning activities and constructive involvement with peers and teachers. AI can support this dimension by offering practice opportunities, immediate feedback, adaptive explanations and conversational interaction. However, activity on a screen is not automatically evidence of engagement. A student may submit an AI-generated response quickly while investing very little personal effort. The important distinction is therefore between technological activity and purposeful participation.
2. **Emotional Engagement:** Emotional engagement concerns students' interest, confidence, sense of belonging and attitudes toward learning, teachers, peers and the institution. AI can reduce frustration when students receive timely explanations or language support. Yet emotional engagement also depends on relationships. If AI becomes the default source of assistance, students may have fewer opportunities to seek help from teachers and peers, discuss uncertainty and experience the social dimensions of learning.
3. **Cognitive Engagement:** Cognitive engagement is the depth of mental effort involved in questioning, interpreting, connecting, evaluating, applying and creating. It is the dimension most directly affected by cognitive offloading. If AI is used to generate questions, offer contrasting explanations, identify weaknesses in an argument or provide feedback that the student must evaluate, it can stimulate thinking. If it is used to replace planning, reasoning and writing, it can reduce the productive struggle through which understanding develops.

A useful distinction is therefore: AI-assisted thinking versus AI-substituted thinking. The first can extend a learner's capacity; the second can gradually weaken the learner's opportunity to practise the very skills education seeks to cultivate.

5. Student Well-being in the Era of AI

Student well-being refers to the learner's capacity to function positively, develop supportive relationships, cope with challenges, experience belonging and pursue meaningful goals. In AI-supported education, well-being should be viewed broadly rather than reduced to the absence of technological harm.

1. **Physical Well-being:** Healthy routines, sleep, movement and reasonable screen habits remain relevant when learning increasingly occurs through connected devices.
2. **Emotional Well-being:** Confidence, resilience, emotional regulation and a sense of competence can be supported by timely academic assistance, but constant comparison with AI-generated performance or fear of academic misuse can also create pressure.
3. **Social Well-being:** Learning is fundamentally relational. Peer discussion, teacher support, collaborative problem solving and belonging cannot be replaced by efficient interaction with a machine.
4. **Psychological Well-being:** Autonomy, competence, purpose and self-efficacy are strengthened when learners make decisions and understand why they are learning. Excessive dependence on automated answers may undermine these experiences.
5. **Digital Well-being:** Digital well-being involves using technology in ways that protect attention, relationships, privacy and healthy boundaries. AI literacy must therefore include not only technical skill but also the ability to decide when not to use AI.

6. Educational Opportunities Created by AI

AI can contribute to engagement and well-being when it is deliberately embedded in sound pedagogy. Its value lies less in automation itself than in the learning possibilities created by thoughtful use.

1. **Personalised Support:** Students can request an alternative explanation, an additional example, a practice problem or feedback at a level appropriate to their current understanding. This can support learner autonomy and reduce avoidable frustration.
2. **Feedback and Revision:** AI can provide rapid formative feedback on language, structure, reasoning or problem-solving. The educational benefit is greatest when students use the feedback to revise and explain their choices rather than simply accepting the generated answer.
3. **Inquiry and Dialogue:** Conversational systems can be used to generate competing explanations, challenge an argument, simulate viewpoints or pose follow-up questions. Such use can transform AI from an answer-producing device into a prompt for inquiry.
4. **Accessibility and Inclusion:** Translation, speech recognition, text-to-speech and adaptive interfaces can reduce some barriers for learners with different linguistic and

learning needs. These tools should complement, not replace, inclusive teaching and human support.

5. **Creativity and Co-creation:** AI can assist brainstorming, scenario generation, visualization and prototyping. Students should remain responsible for selecting ideas, improving them, justifying decisions and producing the final work.

7. Risks and Tensions

1. **Cognitive Offloading and Loss of Productive Struggle:** The most significant educational risk is not simply cheating but the gradual transfer of essential cognitive processes from learner to machine. The OECD notes that poorly guided GenAI use can improve task performance without producing corresponding learning gains and can contribute to disengagement and weakened metacognitive development (OECD, 2026). Students need opportunities to struggle productively, retrieve information, construct explanations, make mistakes and revise their thinking.
2. **Academic Integrity and Authorship:** GenAI complicates traditional definitions of plagiarism because students may submit text that they did not independently produce even when no conventional source has been copied. The response should not be limited to surveillance. Assessment needs to make thinking visible through drafts, oral explanations, process records, reflection, demonstrations and authentic application.
3. **Privacy, Bias and Safety:** AI systems may process personal or educational information and may produce inaccurate or biased outputs. UNESCO therefore emphasizes data privacy, ethical validation, age-appropriate use and human-centred governance (UNESCO, 2023). Students need explicit guidance about what information should never be entered into public AI systems and how generated claims should be checked.
4. **Digital Inequality:** AI can widen rather than reduce educational inequality when access to devices, reliable connectivity, premium tools, language support or adult guidance is uneven. Equitable implementation requires institutional alternatives so that learning does not depend on a student's ability to purchase or access a particular AI service.
5. **Reduced Human Interaction:** Education is not only a transaction between learner and information. Discussion, empathy, mentorship, cooperation and shared classroom experiences contribute to development. AI should therefore expand opportunities for human interaction rather than displace them.

8. The AI Engagement Paradox

AI creates a recurring paradox: the same capability can produce an educational benefit or a developmental cost depending on how it is used.

AI capability	Potential benefit	Potential risk
Personalization	Responsive explanations and practice	Narrow dependence on automated assistance
Speed	Rapid feedback and access	Reduced patience and productive struggle
Information access	Broader inquiry	Weak source evaluation
Idea generation	Creative starting points	Loss of originality or ownership
Automation	Reduced routine workload	Reduced practice of foundational skills
Conversation	Interactive questioning	Substitution for human dialogue
Support	Greater learner confidence	Over-reliance and reduced self-efficacy
Accessibility	Reduced language and interface barriers	Unequal access to advanced tools

9. Proposed Human-Centred AI Engagement and Well-being Framework

The central argument of this paper is that AI integration should be evaluated through human developmental outcomes. The proposed framework contains six connected dimensions. None is sufficient by itself; meaningful AI-enabled learning occurs when they operate together.

1. **Meaningful Engagement:** Students participate actively, persist with learning tasks and connect AI use to clear learning purposes.
2. **Cognitive Agency:** Students retain responsibility for questioning, reasoning, decision-making, verification and final judgement.
3. **Emotional Well-being:** AI use supports confidence and reduces unnecessary frustration without replacing human care or counselling.
4. **Social Connectedness:** AI complements peer learning, teacher-student relationships and collaborative experiences.
5. **Ethical and Critical AI Literacy:** Students understand limitations, bias, privacy, authorship, verification and responsible use.
6. **Digital Balance:** Students regulate when, why and how long they use AI and maintain opportunities for AI-free thinking, reading and interaction.

The framework can be represented as a simple principle: Purposeful AI Use → Active Cognitive Engagement → Human Interaction and Reflection → Well-being → Responsible AI Agency. Feedback from each stage should inform the next. For example, if AI use increases speed but reduces reflection, the learning design should be adjusted rather than treating greater speed as success.

10. Pedagogical Strategies for Human-Centred AI Use

1. **AI-Supported Inquiry**: Students formulate their own questions, use AI for preliminary exploration, consult independent sources, compare evidence and write conclusions in their own words.
2. **AI as a Debate Partner**: Students ask AI to produce an argument or counterargument and then identify assumptions, weaknesses, missing evidence and alternative interpretations.
3. **AI Error Analysis**: Teachers present intentionally flawed AI-generated answers. Students locate errors, verify claims and explain corrections. This makes critical evaluation part of the learning task.
4. **AI-Free Learning Windows**: Selected activities should require independent reading, memory retrieval, handwritten reasoning, discussion or problem solving without AI. The purpose is skill development, not technology rejection.
5. **Human-AI Collaborative Projects**: AI may support brainstorming, simulation or feedback, but students define the problem, select evidence, make decisions and defend the final product.
6. **Reflection after AI Use**: Students record what the AI contributed, what they changed, what they rejected and what they learned. Reflection converts invisible assistance into a metacognitive learning opportunity.
7. **Teacher-Led Verification**: Teachers should model source checking, triangulation, citation practice and recognition of uncertainty. Students need to learn that fluent AI output is not the same as reliable knowledge.

11. Assessment in the AI Era

Assessment is one of the areas most affected by GenAI. When an assignment can be completed by a student and a chatbot working together, the final written product alone provides limited evidence of the student's knowledge and reasoning. The response should be a shift toward process-sensitive and authentic assessment rather than a simple attempt to prohibit technology.

- oral explanation or viva voce after submission;
- project-based tasks linked to local or authentic problems;
- portfolio assessment showing drafts, revisions and evidence;
- reflective journals describing decisions and learning;
- peer and self-assessment;
- case analysis and application tasks;
- demonstrations or performances;
- AI-output critique and verification tasks;
- process documentation showing how evidence, prompts, revisions and decisions were used.

Assessment should also distinguish between permitted and non-permitted AI assistance.

Where AI is permitted, students should disclose the nature of assistance according to institutional rules. The central question should be: what evidence demonstrates that the learner understands, can explain and can apply the knowledge?

12. Role of the Teacher

AI does not make the teacher less important; it changes the distribution of professional work. Teachers remain responsible for learning goals, developmental appropriateness, classroom relationships, ethical judgement and assessment quality.

1. **Facilitator:** Creates purposeful learning experiences and productive interaction.
2. **Learning Designer:** Decides where AI adds value and where independent practice is essential.
3. **AI Mentor:** Helps students interpret and evaluate AI outputs.
4. **Ethics Educator:** Develops responsible habits concerning privacy, authorship, fairness and safety.
5. **Well-being Observer:** Notices disengagement, overload and withdrawal and responds through human support.
6. **Assessment Designer:** Constructs tasks that reveal reasoning, application and reflection.
7. **AI Literacy Educator:** Develops students' understanding of capabilities, limitations and social consequences.

13. Implications for NEP 2020

NEP 2020 offers a policy context that is compatible with a human-centred approach to AI. The policy identifies educational technology as a means of improving teaching-learning, assessment, access and teacher professional development, while also recognizing the disruptive potential of AI and other emerging technologies. It stresses the need to strengthen higher-order competencies rather than overloading learners with factual and procedural knowledge (Ministry of Education, 2020).

This orientation has an important implication: AI should be introduced not simply because it is innovative, but because it helps achieve educational purposes such as critical thinking, creativity, communication, collaboration, inclusion and lifelong learning. NEP 2020's emphasis on technology evaluation, digital access and holistic development therefore supports a balanced approach in which technological innovation is accompanied by pedagogical judgement and attention to learner well-being.

14. Institutional Recommendations

- Create clear, age-appropriate and discipline-sensitive AI-use policies.
- Protect student data and avoid unnecessary collection or sharing of personal information.
- Provide equitable access or non-AI alternatives so that assessment does not depend on private technology access.

- Offer sustained professional development in AI literacy, pedagogy, ethics and assessment.
- Integrate critical AI literacy across subjects rather than treating it as a stand-alone technical topic.
- Preserve regular opportunities for discussion, reading, writing, practical work and problem solving without AI.
- Strengthen counselling, mentoring and student-support systems for digital well-being.
- Review assessment practices regularly as AI capabilities change.
- Encourage institutional research on the actual effects of AI use on learning, engagement and well-being.

15. Recommendations for Students

- Use AI to support learning rather than to avoid learning.
- Think independently before asking AI to solve a problem.
- Verify important information with reliable and independent sources.
- Question AI outputs instead of assuming that fluent answers are correct.
- Protect personal, academic and sensitive information.
- Disclose AI assistance when required by institutional or assessment rules.
- Keep records of substantial AI assistance when transparency is expected.
- Maintain healthy digital boundaries and regular periods of technology-free study.
- Preserve human discussion, collaboration and help-seeking as essential parts of learning.

16. Discussion

The literature and policy evidence reviewed in this paper suggest that the educational impact of GenAI is conditional rather than predetermined. The same tool can strengthen engagement when it prompts inquiry, feedback and revision, yet weaken engagement when it removes the need to think. The distinction is therefore not between 'AI use' and 'no AI use' but between purposeful and purposeless use.

Student well-being adds another layer to this argument. A system may make academic work faster without making the learning experience healthier. Convenience is valuable, but education also requires attention, perseverance, social connection and a sense of personal competence. Human-centred AI therefore asks educators to protect the developmental experiences that cannot be measured by task completion alone.

The proposed framework contributes a practical synthesis by bringing engagement, cognitive agency, emotional well-being, social connection, AI literacy and digital balance into one model. Its value is primarily conceptual. Future studies should test the framework with students from different educational levels and social contexts and examine whether specific AI-supported strategies produce measurable changes in engagement, learning outcomes and well-being.

17. Conclusion:

Artificial intelligence is becoming a significant component of contemporary education, but its educational value cannot be inferred from its sophistication or popularity. GenAI can provide personalised explanations, rapid feedback, accessibility and creative support. It can also encourage cognitive offloading, dependency, weak verification, privacy risks and reduced human interaction when used without clear educational purpose.

The central principle emerging from the reviewed evidence is that AI should augment human intelligence rather than replace human thinking, relationships or agency. Meaningful engagement requires students to question, reason, create, collaborate and reflect. Well-being requires autonomy, competence, belonging, purpose and healthy digital boundaries. Teachers remain central because they provide the pedagogical, ethical and relational judgement that technology cannot supply on its own.

A future-ready educational system should therefore aim for neither unrestricted adoption nor blanket rejection of AI. It should build conditions in which students learn when to use AI, how to use it, how to challenge it and, equally importantly, when to work without it. The measure of successful AI integration should ultimately be the development of capable, ethical, connected and psychologically supported learners.

ARTIFICIAL INTELLIGENCE IN ASSESSMENT AND FEEDBACK: ENHANCING EDUCATIONAL EVALUATION

Dr. Sumathi R.
Principal, Ponkaliyamman College of Education, Karur, Tamil Nadu

Abstract

Assessment is an integral component of the teaching-learning process as it provides information regarding learner achievement, progress and learning difficulties. Conventional assessment practices often require considerable time for preparation, administration, scoring and providing feedback. The emergence of Artificial Intelligence (AI) has introduced new possibilities for transforming educational assessment and feedback. AI can support automated assessment, intelligent question generation, learner performance analysis, personalized feedback and identification of learning gaps. AI-powered assessment systems can analyse learner responses and provide timely information that can assist both teachers and learners. Such systems can also support formative assessment by enabling continuous monitoring of learning. However, AI-based assessment requires careful attention to accuracy, fairness, transparency, data privacy and teacher supervision. The present paper discusses the concept of AI in educational assessment, major applications of AI in assessment and feedback, the role of teachers and learners, advantages, challenges and the possibilities of responsible AI-supported assessment. The paper emphasizes that AI should supplement professional teacher judgement rather than replace it.

Key words: Artificial Intelligence, Assessment, Feedback, Automated Assessment, Formative Assessment, Educational Evaluation

INTRODUCTION

Assessment is an essential part of education. It helps teachers understand what learners have learned, identify areas of difficulty and plan further instruction. It also helps learners understand their strengths and areas that require improvement.

Traditional assessment methods include written examinations, assignments, projects, oral tests, classroom observations and other forms of evaluation. Although these methods continue to be valuable, teachers often spend considerable time preparing questions, evaluating responses, recording marks and providing feedback.

The development of Artificial Intelligence has created opportunities to support several aspects of educational assessment. AI can analyse large quantities of learner responses, identify patterns and provide automated or semi-automated feedback.

The use of AI in assessment can therefore shift the focus from assessment merely as a means of assigning marks towards assessment as a tool for supporting learning. Timely feedback can

help learners recognize their errors and take corrective action.

At the same time, educational assessment involves complex human judgement. Creativity, reasoning, communication, attitudes and social-emotional development cannot always be accurately represented through automated systems. Therefore, AI-supported assessment needs to be combined with teacher expertise and professional judgement.

MEANING OF AI-BASED ASSESSMENT

AI-based assessment refers to the use of Artificial Intelligence technologies to support the design, administration, analysis and interpretation of educational assessment.

AI can assist in:

- Generating assessment questions.
- Analysing learner responses.
- Identifying common errors.
- Providing immediate feedback.
- Tracking learner progress.
- Recommending remedial activities.
- Supporting formative assessment.
- Analysing learning patterns.

AI-based assessment should not be considered simply as automated marking. Its broader purpose is to provide useful information that can support teaching and learning.

AI AND FORMATIVE ASSESSMENT

Formative assessment is conducted during the learning process to understand learner progress and provide information for improving learning.

AI can strengthen formative assessment by providing continuous information about learner responses.

A possible AI-supported formative assessment cycle can be represented as:

Learning Activity → Learner Response → AI Analysis → Feedback → Remedial Activity → Reassessment

This cycle enables assessment to become a continuous component of learning rather than an activity conducted only at the end of instruction.

APPLICATIONS OF AI IN EDUCATIONAL ASSESSMENT

1. Automated Scoring

AI can assist in evaluating objective-type questions and certain structured responses. This can reduce teachers' routine workload.

2. Question Generation

AI tools can support teachers in preparing questions of different levels of difficulty and based on specified learning objectives.

3. Personalized Feedback

AI can analyse learner responses and generate immediate feedback indicating areas that require improvement.

4. Identification of Learning Gaps

AI can analyse patterns of incorrect responses and help identify concepts that learners have not adequately understood.

5. Adaptive Assessment

AI can modify the difficulty or type of questions based on previous learner responses.

6. Learning Analytics

AI can analyse assessment data and provide information regarding learner progress and performance patterns.

7. Remedial Support

Based on assessment results, AI systems can recommend additional exercises, explanations or learning materials.

8. Continuous Assessment

AI-supported digital systems can facilitate frequent low-stakes assessment activities and provide timely information to teachers and learners.

AI-BASED FEEDBACK

Feedback is most useful when it is timely, specific and related to learning objectives. AI can provide immediate feedback in many digital learning environments.

AI-supported feedback may include:

- Identification of errors.
- Explanation of incorrect responses.
- Suggestions for improvement.
- Additional examples.
- Recommended learning materials.
- Practice questions.
- Indication of learning progress.

However, feedback generated by AI should be reviewed when accuracy, context or higher-order judgement is important.

ROLE OF THE TEACHER

The introduction of AI into assessment does not eliminate the need for teachers. Instead, it can change the nature of the teacher's assessment responsibilities.

The teacher should:

- Prepare clear learning outcomes.
- Select appropriate assessment methods.
- Use AI tools according to educational objectives.
- Verify AI-generated questions and feedback.
- Monitor learner progress.
- Interpret assessment information.
- Provide human feedback where necessary.
- Identify emotional and contextual factors affecting learning.

- Ensure fairness and inclusiveness.
- Protect learner data.
- Make final professional judgements.

The teacher therefore acts as an evaluator, facilitator, interpreter and guide while using AI as an assisting technology.

ROLE OF THE LEARNER

AI-supported assessment encourages learners to participate actively in the assessment process. Learners should:

- Participate honestly in assessment activities.
- Review AI-generated feedback.
- Identify their learning difficulties.
- Correct errors.
- Use recommended learning resources.
- Reflect on their progress.
- Develop self-assessment skills.
- Critically examine AI-generated information.
- Avoid becoming dependent on AI for completing learning tasks.

ADVANTAGES OF AI IN ASSESSMENT

- Saves teachers' time in routine assessment activities.
- Provides rapid feedback.
- Supports continuous assessment.
- Helps identify individual learning gaps.
- Facilitates adaptive assessment.
- Supports personalized learning.
- Helps teachers analyse learner performance.
- Provides opportunities for remedial instruction.
- Can assist in generating diverse assessment items.
- Encourages learners to monitor their own progress.

CHALLENGES AND LIMITATIONS

Accuracy: AI-generated questions, scoring or feedback may contain errors and therefore require human verification.

Bias: AI systems may produce biased results if the data or algorithms used to develop them contain bias.

Privacy: Assessment systems may process sensitive learner information, requiring appropriate data protection.

Transparency: Teachers and learners should understand, as far as possible, how AI-supported assessment decisions are generated.

Creativity and Higher-Order Thinking: Automated systems may find it difficult to accurately evaluate certain forms of creative, contextual and complex learner responses.

Academic Integrity: The availability of generative AI creates new challenges concerning authentic learner work.

Teacher Dependence: Teachers should not rely completely on AI-generated assessment information without professional judgement.

Digital Inequality: Unequal access to digital technologies may create differences in learners' opportunities to benefit from AI-supported assessment.

PRINCIPLES FOR RESPONSIBLE AI-BASED ASSESSMENT

Effective AI-supported assessment should follow certain principles:

1. **Human Oversight:** Final educational decisions should involve teacher judgement.
2. **Fairness:** Assessment should provide equitable opportunities to learners.
3. **Transparency:** Learners should be informed when AI is used in assessment.
4. **Privacy:** Learner information should be handled responsibly.
5. **Accuracy:** AI-generated content and feedback should be verified.
6. **Accessibility:** AI-supported assessment should consider diverse learner needs.
7. **Educational Purpose:** Technology should serve clearly defined learning objectives.
8. **Critical Use:** Learners should be encouraged to evaluate AI outputs rather than accept them blindly.

CONCLUSION

Artificial Intelligence has significant potential to transform educational assessment and feedback. Through automated assessment support, question generation, learning analytics, adaptive assessment and personalized feedback, AI can help make assessment more continuous, timely and responsive to learner needs. However, assessment is not merely a technical process of assigning marks. It involves understanding learners, interpreting their performance and making educational decisions. These responsibilities require human judgement, empathy and professional expertise. Therefore, AI should be viewed as a supportive technology rather than a replacement for teachers. The effective combination of AI capabilities and teacher expertise can create assessment practices that are more efficient, informative and learner-centred. The future of assessment should focus on using AI sensibly and ethically so that technology strengthens learning without compromising fairness, human interaction and educational values.

ARTIFICIAL INTELLIGENCE FOR PERSONALIZED AND ADAPTIVE LEARNING: TRANSFORMING THE TEACHING-LEARNING PROCESS

Smt. Arundathi A.N.
Lecturer, National College of Education, Shivamogga, Karnataka

Abstract

Education is undergoing significant transformation with the emergence of Artificial Intelligence (AI) and its increasing integration into the teaching-learning process. Traditional classroom practices generally provide common learning experiences to a group of learners, although students differ considerably in their abilities, interests, learning pace, prior knowledge and learning needs. Artificial Intelligence provides opportunities to address these individual differences through personalized and adaptive learning environments. AI-based educational systems can analyse learner responses, identify learning gaps, recommend appropriate learning resources and provide individualized feedback. Personalized learning supported by AI enables learners to progress according to their own pace and learning requirements, while adaptive learning systems dynamically modify learning content and activities based on learner performance. AI can therefore support teachers in designing flexible learning experiences and can help learners become more active and self-directed. However, effective implementation requires responsible use of technology, teacher supervision, data privacy, digital accessibility and critical evaluation of AI-generated content. The present paper discusses the concept of Artificial Intelligence in education, personalized and adaptive learning, applications of AI in individualized learning, the role of teachers and learners, advantages, challenges and the possibilities of AI for creating inclusive and learner-centred educational environments.

Key words: *Artificial Intelligence, Personalized Learning, Adaptive Learning, Individualized Learning, AI in Education, Learner-Centred Education*

INTRODUCTION

Education is an important instrument for the intellectual, social, emotional and overall development of an individual. The changing educational scenario has created a need for teaching-learning approaches that recognize the diversity of learners. In a conventional classroom, the teacher generally provides the same instructional content and learning activities to a group of students. However, learners differ in their previous knowledge, abilities, interests, pace of learning and learning requirements.

The development of digital technologies has opened new possibilities for addressing these differences. Artificial Intelligence is one of the emerging technologies that has the potential to transform educational practices. AI can process large amounts of information, identify patterns in learner performance and support teachers in making informed instructional decisions.

Artificial Intelligence does not simply represent another technological tool. It can support a

shift from a common learning experience towards more personalized and flexible learning. AI-powered educational systems can provide learning materials according to the learner's level, suggest additional activities when difficulties are identified and offer immediate feedback.

The integration of AI with personalized and adaptive learning therefore provides opportunities to make teaching more responsive to individual learner needs. At the same time, the teacher continues to play a central role in planning, guiding, motivating and monitoring the learning process.

MEANING OF ARTIFICIAL INTELLIGENCE IN EDUCATION

Artificial Intelligence refers to the ability of computer systems to perform tasks that generally require human intelligence, such as analysing information, recognizing patterns, understanding language, making predictions and generating responses.

In education, AI refers to the application of intelligent computational systems to support different educational activities such as teaching, learning, assessment, feedback, content development and learner support.

AI-based educational systems can collect and analyse information about learner performance. Based on this information, the system can recommend learning materials, modify the level of difficulty and provide feedback.

Thus, AI in education can be understood as a technology-supported approach that assists teachers and learners in making the teaching-learning process more responsive, flexible and individualized.

PERSONALIZED LEARNING

Personalized learning is an approach in which learning experiences are adapted to the individual needs, interests, abilities and pace of learners.

In a personalized learning environment:

- Learners may have different learning goals and pathways.
- Learning resources can be selected according to individual needs.
- Learners can progress at an appropriate pace.
- Feedback can be provided according to individual performance.
- Learners can receive additional support when they experience difficulties.

AI can facilitate personalized learning by analysing learner information and recommending suitable learning activities.

ADAPTIVE LEARNING

Adaptive learning is a technology-supported approach in which learning content, activities or levels of difficulty are dynamically modified according to learner performance.

For example, when an AI-supported learning system identifies that a learner has difficulty understanding a particular concept, it may provide additional explanations, examples, practice exercises or remedial resources. When the learner demonstrates mastery, the system may provide more challenging activities.

Thus, adaptive learning creates a flexible learning pathway rather than requiring every learner to follow exactly the same sequence.

AI-BASED PERSONALIZED AND ADAPTIVE LEARNING PROCESS

The integration of AI into personalized learning can be represented through the following stages:

1. Learner Profile:

The system gathers information about the learner's previous knowledge, performance, interests and learning requirements.

2. Learning Diagnosis:

AI analyses learner responses and identifies strengths, weaknesses and learning gaps.

3. Content Recommendation:

Appropriate learning materials, videos, examples, activities and exercises are recommended.

4. Adaptive Learning Path:

The system modifies the sequence or difficulty of learning activities according to learner performance.

5. Continuous Feedback:

Learners receive timely feedback regarding their performance.

6. Progress Monitoring:

AI-supported systems can provide information regarding learner progress and areas requiring further attention.

7. Teacher Intervention:

The teacher reviews learner progress and provides appropriate guidance, encouragement and additional support.

APPLICATIONS OF AI IN PERSONALIZED LEARNING

Artificial Intelligence can be used in personalized and adaptive learning in several ways:

1. Personalized Content Recommendation:

AI can recommend learning resources according to individual learner requirements.

2. Intelligent Tutoring:

AI-powered tutoring systems can provide explanations, practice activities and feedback.

3. Adaptive Questioning:

The difficulty of questions can be adjusted according to learner responses.

4. Individualized Feedback:

AI can provide immediate feedback on learner responses and suggest areas for improvement.

5. Learning Analytics:

AI can analyse learner performance data and help identify learning patterns.

6. Language Learning:

AI-supported systems can assist learners with vocabulary, pronunciation, writing and language practice.

7. Remedial Learning:

Learners who experience difficulty can receive additional learning resources and practice.

8. Enrichment Learning:

Advanced learners can be provided with challenging activities and additional resources.

ROLE OF THE TEACHER

Although AI can provide personalized learning support, the teacher remains an important component of the educational process.

The teacher's role includes:

- Identifying learning objectives.
- Selecting appropriate AI-supported resources.
- Monitoring learner progress.
- Interpreting AI-generated information.
- Providing emotional and social support.
- Encouraging critical thinking and creativity.
- Verifying the accuracy of AI-generated content.
- Maintaining ethical and responsible use of AI.
- Providing individual guidance wherever required.
- Creating a supportive and inclusive learning environment.

AI can assist the teacher, but it cannot replace the teacher's human understanding, empathy, judgement and ability to build meaningful relationships with learners.

ROLE OF THE LEARNER

AI-supported personalized learning changes the learner from a passive recipient of information into an active participant.

The learner is expected to:

- Take responsibility for learning.
- Use recommended learning resources.
- Learn according to an appropriate pace.
- Respond to feedback.
- Identify areas requiring improvement.
- Ask questions and seek clarification.
- Develop self-learning habits.
- Evaluate AI-generated information critically.
- Use AI responsibly and ethically.

ADVANTAGES OF AI-BASED PERSONALIZED LEARNING

- Provides individualized learning experiences.
- Supports self-paced learning.
- Helps identify learning gaps.
- Provides immediate feedback.
- Supports remedial and enrichment learning.

- Increases learner engagement.
- Provides opportunities for continuous learning.
- Helps teachers monitor learner progress.
- Supports diverse learning needs.
- Encourages learner autonomy.

CHALLENGES AND LIMITATIONS

Despite its potential, AI-based personalized learning has several challenges:

Digital Divide: Unequal access to digital devices and reliable internet may prevent some learners from benefiting equally.

Data Privacy: AI systems may require learner data, creating concerns regarding privacy and responsible data management.

Accuracy of AI Output: AI-generated information may sometimes be inaccurate or inappropriate and therefore requires human verification.

Overdependence on Technology: Excessive dependence on AI may reduce opportunities for independent thinking if learners accept AI responses without evaluation.

Teacher Preparedness: Teachers need appropriate digital and AI competencies to use AI effectively.

Ethical Concerns: Bias, transparency, privacy and responsible use must be considered while implementing AI in education.

Human Interaction: Education involves emotional, social and interpersonal dimensions that cannot be completely provided by an AI system.

CONCLUSION: Artificial Intelligence has created new possibilities for personalized and adaptive learning. By analysing learner performance and providing suitable content, activities and feedback, AI can help create flexible learning environments that recognize individual differences. Personalized and adaptive learning can support learners who require additional assistance as well as learners who are ready for advanced learning experiences. However, technology should be used as a means of improving education rather than replacing the teacher. The teacher remains the facilitator, mentor, motivator and human guide of the learning process. Effective AI integration requires a balanced combination of technology and human interaction. The future of education should therefore focus not on making learners dependent on AI, but on helping them use AI intelligently, critically, creatively and responsibly. When used appropriately, AI can supplement teachers and contribute to a more learner-centred, inclusive and effective educational environment.

HUMAN INTELLIGENCE MEETS ARTIFICIAL INTELLIGENCE: PREPARING TEACHERS FOR THE SMART EDUCATION ERA

Veena G.E
Lecturer, National College of Education, Shivamogga.

Abstract

Artificial Intelligence (AI) is rapidly transforming the landscape of education, moving classrooms from traditional, one-size-fits-all instruction toward personalized, data-driven, and technology-enhanced learning environments. While much attention has been given to AI's impact on student learning outcomes, an equally important dimension is its effect on teachers — their roles, competencies, and professional identity. This paper examines how AI is reshaping education systems globally and, more specifically, how teacher preparation and professional development must evolve to meet the demands of a "smart" future. It explores the current applications of AI in education, the changing role of teachers from knowledge-transmitters to facilitators and mentors, the core competencies teachers must develop, the challenges of AI adoption in teaching, and policy recommendations for building an AI-ready teaching workforce. The paper concludes that successful integration of AI in education depends not merely on technological infrastructure but on empowering teachers with the skills, ethical grounding, and pedagogical vision necessary to harness AI as a partner rather than a replacement.

Introduction

The twenty-first century has witnessed an unprecedented convergence of technology and education. Among the many innovations reshaping the sector, Artificial Intelligence stands out as one of the most transformative forces. From intelligent tutoring systems and automated grading to predictive analytics and adaptive learning platforms, AI is redefining how knowledge is delivered, assessed, and personalized (Luckin et al., 2016). As educational institutions increasingly adopt AI-driven tools, the traditional role of the teacher is undergoing a fundamental shift. Historically, teachers have functioned as the primary source of knowledge, responsible for content delivery, assessment, and classroom management. However, with AI systems capable of performing many of these tasks — often more efficiently and at scale — the question arises: what does it mean to be a teacher in an AI-augmented classroom? This paper argues that rather than diminishing the role of teachers, AI necessitates a reimagining of teacher identity, requiring educators to become facilitators of learning, curators of technology, and mentors of critical and ethical thinking. Preparing teachers for this "smart future" is not optional but essential if the promise of AI in education is to be realized equitably and effectively.

The Emergence of AI in Education

Artificial Intelligence in Education (AIEd) is not a new phenomenon, though its scale and sophistication have grown considerably in the last decade. Early applications included computer-assisted instruction and simple adaptive software, but contemporary AI systems leverage machine learning, natural language processing, and big data analytics to deliver far more nuanced educational experiences (Holmes, Bialik, & Fadel, 2019).

Some of the most prominent applications of AI in education today include:

- **Intelligent Tutoring Systems (ITS):** These systems simulate one-on-one tutoring by adapting content difficulty and pacing based on a learner's performance, providing immediate feedback and remediation (VanLehn, 2011).
- **Adaptive Learning Platforms:** Tools such as DreamBox and Squirrel AI use algorithms to personalize learning pathways for individual students, adjusting content in real time based on their responses.
- **Automated Assessment and Grading:** AI-powered systems can now grade essays, quizzes, and even coding assignments, freeing teachers from repetitive administrative tasks (Zawacki-Richter et al., 2019).
- **Learning Analytics and Predictive Systems:** Institutions use AI to analyze student data and predict at-risk learners, enabling early intervention (Siemens & Baker, 2012).
- **Chatbots and Virtual Assistants:** AI-driven chatbots provide round-the-clock support for administrative queries, homework help, and even emotional check-ins with students.
- **Generative AI Tools:** More recently, generative AI systems capable of producing text, explanations, and even lesson content have entered classrooms, offering both opportunities for creativity and challenges around academic integrity.

These technologies collectively point toward a future where education is increasingly personalized, data-informed, and technologically mediated. However, the effectiveness of these tools is deeply contingent on how well teachers are prepared to integrate, supervise, and critically evaluate them within pedagogical practice.

The Changing Role of the Teacher

The integration of AI into classrooms does not eliminate the need for teachers; rather, it transforms what effective teaching looks like. Several scholars have noted that AI is best positioned to handle routine, repetitive, and data-intensive tasks, while uniquely human capacities — empathy, moral reasoning, creativity, and relationship-building — remain irreplaceable (Selwyn, 2019).

From Knowledge Transmitter to Learning Facilitator

In traditional models, teachers were the primary gatekeepers of information. With AI systems now able to deliver content, answer questions, and even explain complex concepts, teachers are increasingly positioned as facilitators who guide students in interpreting, questioning, and

applying information rather than simply receiving it. This shift aligns with constructivist pedagogies that emphasize active, student-centered learning (Vygotsky, 1978).

From Assessor to Data Interpreter

While AI can automate grading and generate performance data, teachers must now develop the skill of interpreting this data meaningfully. Learning analytics dashboards provide rich information about student engagement and progress, but translating this data into actionable pedagogical strategies remains a distinctly human task requiring contextual judgment (Mandinach & Gummer, 2016).

From Sole Educator to Human-AI Collaborator

Perhaps the most significant shift is the emergence of a collaborative relationship between teacher and machine. Teachers are now expected to work alongside AI systems — selecting appropriate tools, monitoring their outputs for bias or error, and blending machine efficiency with human judgment. This collaborative model requires new forms of digital literacy and critical evaluation skills that were not traditionally part of teacher education curricula.

From Instructor to Ethical Guide

As students increasingly interact with AI systems, including generative AI tools, teachers must also take on the role of ethical guides, helping students navigate issues such as misinformation, algorithmic bias, data privacy, and academic integrity. This requires teachers themselves to possess a solid understanding of how AI systems function and where their limitations lie (UNESCO, 2021).

Core Competencies for AI-Ready Teachers

Given these evolving roles, teacher education and professional development programs must be redesigned to cultivate a specific set of competencies. Drawing on frameworks proposed by UNESCO (2021) and other researchers, the following competencies emerge as critical:

Digital and AI Literacy: Teachers need a foundational understanding of how AI systems work, including basic concepts of machine learning, data-driven decision-making, and algorithmic bias, even if they are not expected to become technical experts.

Data Interpretation Skills: The ability to read and act upon learning analytics data is essential for tailoring instruction to individual student needs.

Pedagogical Adaptability: Teachers must be able to flexibly integrate AI tools into diverse instructional strategies, shifting between direct instruction, facilitated discussion, and independent AI-assisted learning as appropriate.

Critical and Ethical Reasoning: As AI systems are not infallible, teachers must critically evaluate AI-generated content and outputs, and instill similar critical thinking skills in their students.

Socio-Emotional Competence: As AI takes over more routine cognitive tasks, the human elements of teaching — empathy, motivation, mentorship, and relationship-building — become even more central to a teacher's role.

Lifelong Learning Orientation: Given the pace of technological change, teachers must adopt a mindset of continuous learning, regularly updating their skills to keep pace with emerging tools and practices.

Teacher Training and Professional Development for the AI Era

Preparing teachers for an AI-integrated future requires systemic changes at multiple levels of the education ecosystem.

Pre-Service Teacher Education

Teacher training institutions and colleges of education must embed AI literacy and digital pedagogy into their curricula. This includes coursework on educational technology, data ethics, and hands-on practicum experiences using AI-based teaching tools, so that new teachers enter the profession already comfortable with these systems (Zawacki-Richter et al., 2019).

In-Service Professional Development

For teachers already in the workforce, continuous professional development is critical. Short-term workshops are often insufficient; instead, sustained, iterative training programs that allow teachers to experiment with AI tools in real classroom settings, reflect on outcomes, and receive mentorship tend to be more effective (Darling-Hammond, Hyler, & Gardner, 2017).

Institutional and Policy Support

Ministries of education and school administrations play a crucial role by providing the infrastructure, incentives, and time necessary for teachers to engage in meaningful AI-related professional growth. Policies should also address equitable access, ensuring that teachers in under-resourced schools are not left behind in this transition (UNESCO, 2021).

Communities of Practice

Peer learning communities, both within schools and across regions, allow teachers to share experiences, troubleshoot challenges, and co-develop best practices for AI integration. Such communities can accelerate the diffusion of effective strategies more organically than top-down training alone.

Challenges in Preparing Teachers for AI Integration

Despite the clear need, several challenges hinder effective teacher preparation for AI-enhanced education.

Resistance to Change: Many educators express apprehension about AI, fearing job displacement or a loss of professional autonomy. Addressing these fears requires clear communication about AI's role as a complement to, rather than a replacement for, teachers (Selwyn, 2019).

Digital Divide: Unequal access to technology and reliable internet connectivity, particularly in rural and low-income areas, limits the extent to which teachers can meaningfully integrate AI tools into their practice.

Insufficient Training Infrastructure: Many teacher education programs lack the resources, expertise, or curricular flexibility to incorporate robust AI training, resulting in a gap between policy aspirations and classroom realities.

Ethical and Privacy Concerns: The use of AI in education raises significant concerns about student data privacy, algorithmic bias, and the potential for AI systems to reinforce existing educational inequities (Holmes et al., 2019). Teachers must be equipped to navigate these concerns thoughtfully.

Rapid Pace of Technological Change: The fast-evolving nature of AI tools means that training programs risk becoming outdated quickly, requiring ongoing curriculum revision and flexible, adaptable training models.

Recommendations

Based on the analysis above, the following recommendations are proposed for policymakers, teacher educators, and school leaders:

1. **Integrate AI literacy into teacher education curricula** at both pre-service and in-service levels, ensuring foundational understanding of AI concepts, tools, and ethical considerations.
2. **Invest in infrastructure and equitable access**, ensuring that all schools, regardless of socioeconomic context, have the technological resources needed for AI integration.
3. **Promote a human-centered vision of AI in education**, emphasizing AI as a tool that augments rather than replaces the relational and ethical dimensions of teaching.
4. **Establish continuous professional development pathways**, including mentorship, peer learning communities, and hands-on experimentation with AI tools.
5. **Develop clear ethical guidelines and data governance frameworks** to protect student privacy and ensure responsible AI use in classrooms.
6. **Encourage research and localized innovation**, supporting context-specific studies on how AI can be effectively integrated into diverse educational settings, particularly in developing regions.
7. **Foster teacher agency and voice** in the design and selection of AI tools, ensuring that technology adoption is driven by pedagogical needs rather than purely commercial or administrative considerations.

Conclusion

Artificial Intelligence holds tremendous potential to enhance educational outcomes through personalization, efficiency, and data-driven insight. However, the successful realization of this potential hinges not on technology alone, but on the readiness of teachers to adapt, innovate, and lead within AI-augmented learning environments. As classrooms evolve into "smart" spaces where human and artificial intelligence work in tandem, teachers must be reimagined not as passive recipients of technological change but as active architects of a pedagogy that blends machine efficiency with human wisdom. Preparing teachers for this future requires sustained investment in teacher education, professional development,

infrastructure, and ethical governance. Ultimately, the smart classrooms of tomorrow will be defined not merely by the sophistication of their AI systems, but by the depth of human insight, empathy, and critical judgment that teachers bring to guide their use.

IMPACT OF ARTIFICIAL INTELLIGENCE IN LIBRARIES: ENHANCING SERVICES AND EMPOWERING USERS FOR A SMART FUTURE

Kum. Pavithra S. M
Librarian, National College of Education, Shivamogga

Abstract

Artificial Intelligence (AI) is rapidly transforming the way information is created, organized, accessed, and disseminated, bringing significant changes to the traditional functioning of libraries. Libraries, as knowledge and information centres, are increasingly adopting AI-based technologies to improve service efficiency, enhance information discovery, automate routine operations, and provide personalized support to users. AI applications such as intelligent search systems, recommendation engines, chatbots, virtual reference services, automated cataloguing and classification, natural language processing, machine learning, optical character recognition, and predictive analytics are creating new possibilities for smart and user-centred library services. These technologies can reduce repetitive workloads for library professionals and enable them to devote greater attention to information literacy, research support, digital scholarship, and user engagement. The impact of AI extends beyond automation. It has the potential to empower users by providing faster access to relevant information, personalized recommendations, multilingual assistance, 24-hour reference support, and improved accessibility for diverse categories of learners and researchers. At the same time, the integration of AI raises important concerns related to data privacy, algorithmic bias, misinformation, intellectual property, cybersecurity, digital inequality, transparency, and the changing professional roles of librarians. Therefore, the successful adoption of AI requires not only technological infrastructure but also ethical policies, skilled library professionals, digital literacy, and responsible governance. This paper examines the emerging impact of Artificial Intelligence on library services and explores how AI can contribute to the development of smart, inclusive, accessible, and user-empowered libraries. It also highlights the changing role of librarians and the need to balance technological innovation with human judgement and professional values.

Keywords: *Artificial Intelligence, Libraries, Smart Library, Library Services, AI Literacy, Digital Literacy, Librarians, Future of Libraries*

Introduction:

Libraries have traditionally served as institutions for collecting, organizing, preserving, and providing access to knowledge and information. However, the rapid growth of digital technologies has significantly changed the nature of information resources, user expectations, and methods of information delivery. In the contemporary digital environment, users expect information services to be fast, accurate, personalized, accessible, and available anytime and anywhere. These changing expectations have encouraged libraries to explore emerging technologies that can improve their services and strengthen their role as knowledge centres.

Artificial Intelligence (AI) has emerged as one of the most influential technologies of the twenty-first century. AI refers broadly to computational systems capable of performing tasks that normally require aspects of human intelligence, such as learning, reasoning, language understanding, pattern recognition, prediction, and decision-making. The increasing availability of machine learning, natural language processing, generative AI, computer vision, and data analytics has created new opportunities for libraries to redesign both technical and user-facing services.

The application of AI in libraries is not limited to automation. It can support the entire information lifecycle—from acquiring and organizing resources to discovering, recommending, delivering, and evaluating information. AI-powered systems can assist in automated metadata generation, cataloguing, classification, indexing, document recognition, information retrieval, reference services, and collection management. Intelligent recommendation systems can analyse users' information needs and suggest relevant books, articles, databases, and other scholarly resources. Similarly, AI-powered chatbots and virtual assistants can provide immediate responses to frequently asked questions and guide users towards appropriate information resources.

One of the most significant contributions of AI is its potential to make library services more user-centred and personalized. Traditional library services often depend on users knowing how to formulate search queries or navigate complex information systems. AI-based natural language interfaces can allow users to interact with information systems using ordinary language. This can make information discovery easier, particularly for students and users who may have limited information-search skills. AI can also support multilingual information access and accessibility services, thereby contributing to more inclusive library environments.

AI is also changing the professional role of librarians. Routine and repetitive tasks that traditionally require considerable time and effort may increasingly be supported by intelligent systems. This does not necessarily make librarians less important; rather, it provides an opportunity for them to move towards higher-level responsibilities such as research assistance, information literacy education, digital scholarship, data management, ethical use of information, and critical evaluation of AI-generated content. The librarian of the smart-library era is therefore likely to function not merely as a custodian of documents but as an information facilitator, digital literacy educator, research partner, and ethical guide.

At the same time, the introduction of AI into libraries presents several challenges. The collection and processing of user data may create privacy and surveillance concerns. AI systems can reproduce biases present in their training data, potentially affecting the fairness and reliability of information services. Generative AI may also produce inaccurate or fabricated information, making human verification essential. Questions relating to copyright, intellectual property, authorship, academic integrity, cybersecurity, transparency, and accountability require careful consideration. Furthermore, unequal access to digital

infrastructure and AI literacy may create a new form of digital inequality among library users.

Therefore, the future of AI-enabled libraries should not be understood simply as a transition from human-operated libraries to fully automated systems. Instead, it should be viewed as a human–AI collaborative model, in which technology enhances the capabilities of library professionals while preserving human judgement, ethical responsibility, and the social mission of libraries. The concept of a smart library should ultimately focus on improving the quality, accessibility, inclusiveness, and relevance of information services rather than technology adoption for its own sake.

Against this background, the present paper examines the impact of Artificial Intelligence in libraries, with particular emphasis on the transformation of library services, user empowerment, changing professional roles, opportunities, challenges, and ethical considerations. It argues that responsible and purposeful adoption of AI can help libraries evolve into intelligent, responsive, inclusive, and future-ready knowledge environments while maintaining the fundamental values of intellectual freedom, privacy, equitable access, and human-centred service.

AI and the Transformation of Library Services

AI can transform almost every major area of library service. One of its most visible applications is in information retrieval and discovery. Traditional catalogue systems generally require users to understand particular search techniques, keywords, or subject terminology. AI-powered discovery systems can allow users to ask questions using natural language and receive more relevant results.

For example, instead of searching for several individual keywords, a user could ask a library system a complete question about a research topic. Natural-language processing can help the system understand the meaning and context of the question and identify relevant books, articles, databases, and other resources.

AI can also support virtual reference services. AI-powered chatbots and virtual assistants can answer frequently asked questions about library opening hours, membership, borrowing policies, databases, and basic research procedures. Such systems can provide assistance outside normal library hours and reduce the workload associated with repetitive enquiries.

Personalized Library Services

Another important contribution of AI is personalization. Libraries contain enormous quantities of information, and users can sometimes find it difficult to identify the most relevant resources. AI can analyse search behaviour and resource usage patterns to provide personalized recommendations.

For example, an academic library system could recommend books, research papers, journals, or databases related to a user's previous searches or current research interests. Personalized services can help users discover relevant resources that they might otherwise overlook.

However, personalization must be balanced with privacy. Libraries have traditionally

protected the confidentiality of their users' reading and information-seeking activities. Therefore, AI systems should be designed with strong privacy protections and transparent data practices.

AI-Powered Reference Services

Virtual assistants and AI chatbots can provide basic reference assistance at any time.

They can help users:

- locate library resources;
- identify databases;
- understand library rules;
- find opening hours and services;
- formulate search queries;
- identify relevant keywords;
- navigate digital collections; and
- receive preliminary research guidance.

AI reference services can be particularly useful when librarians are unavailable, while complex research questions can still be referred to professional librarians.

Automation of Routine Library Activities

AI can reduce the amount of time librarians spend on repetitive and routine tasks. Activities such as metadata creation, classification support, subject indexing, document processing, text extraction, and duplicate detection can increasingly be assisted by AI.

AI can analyse documents and suggest keywords, subjects, classifications, or metadata fields. Librarians can then review and verify these suggestions rather than performing every task manually.

This does not necessarily mean that librarians will become less important. Instead, automation can allow librarians to focus on professional judgement, collection development, research support, user education, and other activities where human expertise is essential.

AI in Digital Preservation and Knowledge Management

Libraries are increasingly responsible for large digital collections, including manuscripts, photographs, newspapers, institutional publications, theses, and historical documents. Managing these collections can be difficult because of their size and complexity.

AI can assist with digitization workflows, optical character recognition, image analysis, automatic metadata generation, document classification, and identification of information within large digital collections. These capabilities can make historical and cultural materials easier to discover and use.

AI can therefore contribute to the preservation of knowledge while also improving access to valuable digital resources.

Improving Accessibility and Inclusion

One of the significant advantages of AI is its potential to make library services more accessible. AI-supported speech recognition, text-to-speech, automatic translation, image

recognition, and other technologies can help users with different abilities and language backgrounds.

For example, text-to-speech technology can help users who have difficulty reading printed or digital text, while speech recognition can provide alternative methods of interacting with information systems. Machine translation can also help users access information across language barriers.

Libraries can use these technologies to create more inclusive information environments in which users with different needs can participate more effectively.

Developing Smart Library Users

The role of the library in the AI era extends beyond providing access to AI tools. Libraries must also help users understand how AI works and how it should be used responsibly.

Users need to develop the ability to evaluate AI-generated information, identify misinformation, verify sources, recognize bias, understand copyright and intellectual property issues, and protect personal information. These skills can be described as **AI literacy**.

Libraries are well positioned to provide AI-literacy programmes through workshops, orientation programmes, information-literacy courses, research consultations, and online learning resources. By teaching users how to question and verify AI-generated information rather than accepting it blindly, libraries can contribute to the development of informed and critical-thinking citizens.

Generative AI for Research Support

Generative AI can assist researchers with several early-stage research activities, including:

- brainstorming research topics;
- developing research questions;
- identifying keywords;
- summarizing complex material;
- comparing concepts;
- preparing preliminary outlines;
- improving language; and
- generating possible search strategies.

However, AI-generated information should **not automatically be treated as authoritative**. Researchers should verify claims against reliable scholarly sources and original publications.

Changing Role of the Librarian

The introduction of AI will change the role of librarians, but it does not eliminate the need for professional librarians. In fact, the importance of librarians may increase in several areas.

Librarians can become AI educators, digital-literacy trainers, research consultants, information-quality evaluators, and guides who help users navigate an increasingly complex information environment.

AI can provide information quickly, but librarians can provide professional judgement, context, ethical guidance, source evaluation, and human interaction. The combination of AI

technology and human expertise can produce stronger library services than either one alone. The future librarian is therefore likely to work alongside AI rather than compete with it. The librarian's role will gradually move from simply locating information toward helping users understand, evaluate, interpret, and effectively use information.

Impact of AI on Library Services

1. **Improved Efficiency:** AI can automate repetitive activities, reducing the administrative burden on librarians.
2. **Faster Information Access:**Users can obtain relevant information more quickly through intelligent search and recommendation systems.
3. **24/7 Assistance:**AI-based virtual assistants can provide basic support outside normal library working hours.
4. **Personalized Services:** AI enables libraries to offer services based on users' interests, information needs, and learning activities.
5. **Better Resource Management:** Usage analytics can help libraries understand patterns of resource demand and make evidence-informed decisions.
6. **Enhanced Accessibility:**Voice interfaces, text-to-speech, speech recognition, translation, and other AI technologies can help users with different accessibility needs.

Challenges of Using AI in Libraries

Although AI offers many opportunities, its implementation also creates important challenges. One major concern is **privacy**. AI systems may require large amounts of user and usage data, creating potential risks if data is collected or stored improperly.

Another concern is **algorithmic bias**. AI systems learn from existing data, and biased training data can result in biased recommendations or search results. Libraries must therefore evaluate AI systems carefully and ensure that they support fairness and inclusion.

Misinformation and inaccurate AI-generated content are also significant concerns. Generative AI systems can sometimes produce information that appears convincing but is incorrect. Libraries must teach users to verify AI-generated information against reliable sources.

Copyright and intellectual property present additional challenges. AI-generated content and the use of copyrighted materials in AI systems raise complex questions that libraries must understand and address.

There is also the issue of the **digital divide**. Not every user or library has equal access to advanced technologies, reliable internet connectivity, or AI tools. Libraries must ensure that technological development does not increase existing inequalities.

AI and the Future of Libraries

The future library is likely to be increasingly intelligent, digital, connected, and user-centred. AI can support users in discovering information, conducting research, communicating with library systems, and accessing resources in new ways.However, the future of libraries should not be understood as a completely automated environment. Libraries

are fundamentally human institutions. Their value comes not only from collections and technologies but also from trust, professional expertise, community service, education, and the human relationship between librarians and users.

The most successful libraries will therefore be those that combine technological innovation with professional values. AI can handle repetitive processes and analyse large quantities of information, while librarians can provide judgement, empathy, ethical guidance, and personalized assistance.

Conclusion

Artificial Intelligence has the potential to significantly enhance library services and transform the relationship between libraries, librarians, and users. From intelligent search and virtual reference services to personalized recommendations, automated cataloguing, digital preservation, and accessibility, AI can make library services faster, smarter, and more responsive to user needs.At the same time, AI creates responsibilities concerning privacy, bias, copyright, misinformation, data security, and equitable access. Libraries must therefore adopt AI carefully and ethically.The most important contribution of libraries in the AI era may be helping users become smart and responsible information users. By developing AI literacy, critical thinking, digital skills, and information-evaluation abilities, libraries can prepare users to navigate the rapidly changing information environment.AI should not be viewed as a replacement for librarians. Instead, it should be viewed as a powerful tool that can enhance professional library services. The combination of Artificial Intelligence and human intelligence can create smarter libraries, stronger information services, and better-prepared users for the future.

SMART TECHNOLOGY TO SMART TEACHING: THE ROLE OF TEACHERS IN STUDENT ENGAGEMENT AND WELL-BEING

Chandana S Yogesh
Student Teacher, National College of Education, Shivamogga

Abstract

Artificial Intelligence (AI) is increasingly becoming part of educational practice and is changing the way teachers plan, teach and assess learning. However, the value of AI in education should not be measured only by its ability to save time or improve academic performance. From the perspective of a B. Ed student-teacher observing real classroom dynamics, the fundamental question is whether AI helps educators build supportive learning spaces where students stay genuinely curious, participate actively, think for themselves, and feel emotionally secure. This paper examines the possibilities and challenges of using AI for student engagement and well-being and proposes a practical SMART Teacher Framework for responsible classroom integration. AI can support teachers in preparing differentiated learning materials, providing immediate feedback, generating examples, adapting explanations and creating opportunities for students to learn at their own pace. These possibilities can be useful in classrooms where students differ in learning ability, confidence, language background and pace. At the same time, unrestricted AI use may encourage copying, overdependence on technology, screen fatigue and reduced human interaction. Questions of privacy, unequal access, inaccurate information and academic integrity further complicate its use. The paper therefore argues that AI should complement rather than replace teachers. The proposed SMART Teacher Framework Student-centred, Meaningful, Adaptive, Responsible and Teacher-led Technology integration places the learner and teacher relationship at the centre of AI-supported education. Practical examples from educational institutions, including Cold Spring School, Georgia Tech and Khan Academy, illustrate ways in which AI can be used with human guidance rather than as a replacement for human teaching. The paper concludes that a smart future in education requires not simply smarter technologies, but teachers who can use those technologies thoughtfully, ethically and empathetically to strengthen both student engagement and well-being.

***Keywords**: SMART Technology, Smart teaching, student engagement, wellbeing.*

Introduction

Education has always developed along with changes in society. The blackboard was followed by the projector, the computer, the smart board, online learning platforms and now Artificial Intelligence. Each technological change has influenced classroom practice, but AI is different from many earlier technologies because it can generate, respond, analyze and interact with

learners. For teachers, this creates new possibilities as well as new responsibilities. The rapid advancement of Artificial Intelligence (AI), digital platforms, smart classrooms, learning analytics, virtual environments, and educational applications is transforming the nature of teaching and learning. Technology has moved beyond its traditional role as a supportive teaching aid and has become an integral part of the contemporary educational ecosystem. The transition from "Smart Technology" to "Smart Teaching" therefore requires more than the adoption of sophisticated digital tools; it demands a meaningful transformation in the role, competencies, and responsibilities of teachers. While technology can provide personalized learning, instant feedback, interactive content, and access to vast educational resources, the teacher remains central to creating learning environments that promote student engagement, emotional well-being, social interaction, critical thinking, and responsible use of technology.

Student engagement is a multidimensional concept that includes behavioural, emotional, cognitive, and social participation in the learning process. In technology-rich classrooms, digital tools can increase interaction and provide students with flexible opportunities to learn. However, excessive or inappropriate dependence on technology may also contribute to distraction, passive learning, digital fatigue, reduced face-to-face interaction, and feelings of isolation. Similarly, the increasing use of AI-powered systems raises important concerns regarding privacy, academic integrity, digital dependence, misinformation, equity, and the human dimensions of education. These challenges highlight the need for teachers who can balance technological possibilities with human-centred pedagogy.

The contemporary teacher is therefore evolving from a transmitter of information to a facilitator, mentor, designer of learning experiences, digital guide, motivator, counsellor, and reflective practitioner. Smart teaching involves selecting and integrating technology according to learners' needs rather than using technology simply because it is available. A smart teacher uses digital resources to encourage collaboration, inquiry, creativity, problem-solving, personalized learning, and active participation while ensuring that students remain emotionally connected and socially supported.

The importance of this transformation is particularly significant in the context of NEP 2020, which emphasizes technology-enabled education, experiential learning, competency development, holistic development, and the well-being of learners. The policy envisions education that develops not only knowledge and skills but also the social, emotional, ethical, creative, and intellectual capacities of learners. In this context, technology should function as an enabler of quality education, while teachers provide the human connection necessary for meaningful learning. Thus, "Smart Technology to Smart Teaching" represents a shift from technology-centred education to teacher-guided, learner-centred and well-being-oriented education. The effectiveness of smart classrooms and AI-enabled learning environments ultimately depends not merely on the sophistication of technological tools but on how thoughtfully teachers integrate them into pedagogy. The teacher's ability to create an inclusive, engaging, psychologically safe, and ethically responsible learning environment is

fundamental to ensuring that technological advancement contributes positively to student engagement and overall well-being. This paper presents AI as a support for teaching rather than a substitute for teachers and proposes the SMART Teacher Framework as a practical approach for balancing technology, learning and human well-being.

Artificial Intelligence and Student Engagement

Student engagement is more than classroom attendance or assignment completion. It includes students' participation, mental involvement and emotional connection with learning. AI can contribute to engagement in several practical ways.

- Teachers can use AI to design multi-tiered learning tasks, generating accessible entry points for students requiring foundational support while building challenging application problems for advanced learners.
- When a learner struggles with abstract textbook definitions, an educator can prompt AI to generate everyday analogies, conversational explanations, or step-by-step breakdowns suited to the student's background.
- Immediate diagnostic feedback allows students to pinpoint specific misconceptions and revise their work while their focus is still fresh, preventing errors from becoming ingrained habits.

However, these benefits depend on the type of interaction created by the teacher. If AI always gives the final answer, students may become passive. If AI gives a hint, asks the student to explain a step or provides another example, it can become a learning support. Therefore, the important shift is from using AI to give answers towards using AI to support thinking.

Artificial intelligence, Cognitive Engagement and Independent Thinking

One of the major concerns surrounding generative AI is cognitive offloading. When a learner transfers a thinking task to technology, the immediate task becomes easier, but the learning opportunity may become weaker.

For example, a student asked to write a paragraph may directly ask AI to produce it. The final paragraph may be grammatically correct, but the student may not have practised organising ideas or expressing them independently.

The same concern applies to problem-solving. If students immediately ask AI for the solution to a mathematics problem, they lose the opportunity to struggle productively with the problem. Therefore, AI-supported learning should encourage a cycle of: thinking → attempting → receiving support → checking → improving. Instruction must therefore steer students away from a passive shortcut model (Question → AI Answer → Copy → Submit) toward an active, iterative inquiry cycle: Thinking → Attempting → Receiving Targeted Support → Verifying → Improving.

Teachers can design activities where students first attempt a problem independently, then use AI to identify a mistake or obtain a hint, and finally explain the corrected solution in their own words. Such an approach preserves the student's role as a thinker.

Artificial Intelligence and Student Well-being

Student well-being is closely connected to learning. A student who feels anxious, excluded or constantly unsuccessful may gradually lose interest in classroom participation. AI can provide certain forms of academic support that may indirectly contribute to confidence. However, AI cannot replace emotional understanding.

A teacher can notice when a normally active student becomes quiet. A teacher may recognize hesitation, frustration or loss of confidence even when the student's written work does not show it. This human observation is essential for well-being. The use of AI should therefore not result in fewer teacher–student interactions. Instead, the time saved through AI should ideally allow teachers to spend more meaningful time with students. This is one of the most important principles of the proposed framework.

Risks to Student Well-being

The benefits of AI must be considered alongside its risks.

1. Excessive dependence on digital tools: it may contribute to screen fatigue and reduce opportunities for face-to-face communication. Students also need opportunities to work with peers, participate in practical activities, communicate directly and experience learning away from screens.
2. surveillance anxiety: AI-supported systems can collect information about student activity and performance. Although such information may help teachers identify learning difficulties, students may feel uncomfortable if they believe that every action is being monitored. Privacy is therefore not only a technical issue. It is also a student well-being issue.
3. unequal access: Some students have personal devices, reliable internet and access to advanced AI tools, while others may depend on shared devices or limited connectivity. If AI-based homework becomes compulsory without considering these differences, technology can increase rather than reduce educational inequality. Responsible AI integration therefore requires attention to access, privacy, screen time, academic honesty and emotional safety.

Practical Examples of AI in Education

AI-supported education is no longer only a theoretical possibility. Educational institutions are already experimenting with different models.

One interesting example is Cold Spring School in California, where AI use has been approached through a "Human → AI → Human" model. Students begin with their own thinking, use AI as part of the learning process and then return to their own work for revision and improvement. This model is particularly relevant because AI is treated as a stage in learning rather than the beginning and end of learning.

Another example comes from Georgia Tech, where Jill Watson was developed as an AI teaching assistant to handle routine questions in an online learning environment. The experience demonstrated how AI can assist with repetitive support while human educators remain responsible for deeper teaching and interaction.

Khan Academy has also experimented with AI-supported learning through Khanmigo. Its

district programmes have focused on helping students and teachers use AI as part of learning rather than simply using it as an answer-generating tool. The organisation has also emphasised professional development for educators, which highlights an important point: AI implementation requires teacher preparation, not simply access to software.

These examples suggest that successful AI integration depends on the educational model surrounding the technology.

AI in the Indian School Context

The discussion of AI is especially relevant to Indian education because AI literacy is beginning to enter school-level curriculum and teacher development.

CBSE has introduced computational thinking and understanding of AI as part of its school education initiatives, including a curriculum for Classes 3–8 from the 2026–27 academic session. This reflects a broader movement towards preparing students not merely to use technology but to understand computational thinking and AI-related concepts.

For Indian schools, this development has important implications. Students will increasingly encounter AI in their academic and personal lives. Therefore, schools need to teach not only how to use AI, but also how to question AI, verify AI-generated information and use it responsibly. This is particularly important in classrooms where students may assume that an AI-generated answer is automatically correct. AI literacy should therefore become part of critical thinking.

The SMART Teacher Framework

The central contribution of this paper is the SMART Teacher Framework. The framework is designed not as another technology model but as a practical guide for teachers deciding whether and how to integrate AI.

S – Student centred

AI use should begin with the learner's need. The teacher should consider students' level, learning difficulties, interests and context before selecting an AI-supported activity. The technology should serve the learner.

M – Meaningful

AI should be used only when it adds meaningful educational value. If a discussion, practical experiment, peer activity or teacher explanation is more effective, AI does not need to be used. A lesson should not become “smart” merely because it contains technology.

A – Adaptive

Students differ in their learning pace and level of understanding. AI can assist teachers in creating differentiated examples, practice questions, explanations and feedback. However, adaptation should remain flexible. Students should not be permanently labelled according to their present performance.

R – Responsible

Responsible AI use includes privacy, fairness, academic integrity, verification of information and equitable access.Students should learn that AI can make mistakes and that they remain

responsible for the work they submit.

T – Teacher-led Technology Integration

The teacher remains responsible for deciding when AI is appropriate. This is perhaps the most important principle. AI should not determine pedagogy. Pedagogy should determine the use of AI.

Applying the SMART Framework in a Real Classroom

The framework can be applied to a normal school lesson. Consider a science lesson on motion. The teacher may begin with a real-life classroom demonstration rather than immediately opening an AI tool. Students observe a moving object and discuss what they notice. The teacher then identifies that some students are struggling to distinguish distance and displacement. AI can be used at this stage to generate simple real-life situations or additional examples at different difficulty levels. Students work in pairs and examine the examples. They discuss whether the AI explanation is scientifically correct.

The teacher then brings the class together and clarifies misconceptions. Students finally write their own explanation and solve a problem without AI assistance. In this example, AI has supported the lesson but has not replaced the teacher, practical observation or student thinking. This is the kind of balanced classroom practice that the SMART Teacher Framework aims to promote.

Rethinking Assessment in the Age of AI

AI also requires teachers to reconsider assessment. When students can generate polished written answers using AI, the final product may no longer provide sufficient evidence of individual understanding. Assessment can therefore include oral explanation, classroom problem-solving, project presentations, reflective writing, group discussion, practical demonstrations, process-based assessment, For example, instead of simply asking a student to submit a five-hundred-word essay, the teacher can assess the student's initial ideas, research process, draft, final response and short oral explanation. This does not mean banning AI completely. Instead, it makes the learning process visible. Students can also be asked to explain how AI was used, what information they accepted or rejected and what changes they made. Such assessment develops both subject knowledge and AI literacy.

The Changing Role of the Teacher

AI is likely to reduce some routine tasks, but this does not reduce the importance of teachers. In fact, as information becomes easier to obtain, teachers may become more important as:facilitators, mentors, learning designers, evaluators and ethical guides.

The teacher's role is moving from simply delivering information towards helping students interpret, evaluate and apply information. A teacher may use AI to prepare twenty questions, but the teacher still decides which five are appropriate. AI may suggest an explanation, but the teacher decides whether it is scientifically accurate and suitable for the class. AI may identify that a student is performing poorly, but the teacher investigates the reason. The future of schooling is therefore not teacher versus machine, but an intentional partnership where digital

tools support pedagogical wisdom.

Implications for Teacher Education

Teacher training programmes have an important role in preparing future teachers for AI-supported education. Teachers receive opportunities to practise AI integration rather than learning about AI only through theoretical lectures. Teacher education can include activities such as:

- AI-assisted lesson planning: Teachers prepare a lesson with AI and critically review the output.
- AI error detection: Teachers analyse AI-generated answers and identify inaccurate information.
- AI and assessment: Teachers redesign traditional assignments to assess understanding rather than AI-generate output
- AI ethics: Teachers discuss privacy, bias, academic honesty and equitable access.
- Reflection: Teachers document what worked, what failed and how the lesson could be improved. Such experiences can help future teachers become confident but critical users of AI.

AI should be evaluated according to its educational purpose. A highly advanced AI system may have little educational value if students become passive users. A simple AI-supported activity may have considerable value if it encourages students to question, collaborate and think. Similarly, student engagement should not be measured simply through digital activity. Genuine engagement involves attention, reasoning, participation, curiosity and emotional connection. Student well-being should also remain central. Technology should not increase unnecessary screen exposure, surveillance or academic pressure. The most appropriate approach is therefore, one of balance. Technology should increase possibilities without reducing humanity. Schools implementing AI should develop clear guidelines for teachers and students. AI should be introduced according to age, curriculum and learning purpose rather than through unrestricted access.

Teacher professional development should focus on practical classroom applications, ethical concerns and critical evaluation of AI-generated content. Assessment should increasingly include opportunities for students to demonstrate their own reasoning through oral explanation, classroom tasks, projects and reflections. Most importantly, schools should monitor the effect of AI on student well-being. Students should remain socially connected, emotionally supported and capable of independent thinking.

Conclusion

The transition from Smart Technology to Smart Teaching represents a fundamental shift in the way education is understood and practiced in the digital and AI-driven era. Technology, artificial intelligence, smart classrooms, digital platforms, and learning analytics have created unprecedented opportunities for personalized, interactive, flexible, and accessible learning.

However, technology alone cannot guarantee meaningful learning or the holistic development of students. Its educational value depends largely on the knowledge, creativity, sensitivity, and pedagogical competence of teachers.

Teachers continue to occupy a central position in promoting student engagement and well-being. By integrating technology thoughtfully with learner-centred and experiential approaches, teachers can encourage active participation, collaboration, critical thinking, creativity, self-directed learning, and problem-solving. At the same time, teachers must recognize the possible negative effects of excessive technology use, including distraction, digital fatigue, social isolation, anxiety, reduced interpersonal interaction, and overdependence on AI-generated information. Therefore, smart teaching requires an appropriate balance between digital innovation and human interaction.

The teacher of the future is not simply a user of technology but a facilitator, mentor, designer, motivator, digital citizen, ethical guide, and supporter of student well-being. Teachers need continuous professional development to understand emerging technologies, AI literacy, digital ethics, data privacy, inclusive digital practices, and innovative pedagogies. They must also create psychologically safe classrooms where students feel valued, heard, respected, and connected.

Ultimately, the goal of educational technology should not be to replace teachers but to empower teachers and enrich human learning. A truly smart educational environment is one in which technology serves pedagogical purposes, teachers provide meaningful human connection, and students become active, responsible, confident, and emotionally healthy learners. Hence, the journey from “Smart Technology” to “Smart Teaching” can contribute significantly to building an education system that is not only technologically advanced but also engaging, inclusive, ethical, learner-centred, and committed to the overall well-being of every student.

A CORRELATIONAL STUDY OF TEACHING BEHAVIOUR AND PERCEIVED TEACHER BEHAVIOUR AMONG TEACHER EDUCATORS AT THE SECONDARY LEVEL IN MYSORE DISTRICT

Dr. Chidananda A.L.
Assistant Professor, Department of Studies and Research in Education, Karnataka State Open University, Mukthagangothri, Mysore-570 006, ***Email:*** *friendlychidu@gmail.com*

Abstract

The present study, entitled "A Correlational Study of Teaching Behaviour and Perceived Teacher Behaviour among Teacher Educators at the Secondary Level in Mysore District", was undertaken to examine the teaching behaviour of teacher educators as perceived by student teachers and the perceived teacher behaviour of teacher educators, and to determine the relationship between these two variables. The study adopted a descriptive survey method with a correlational research design. The sample consisted of 40 teacher educators and 200 student teachers from B.Ed. institutions in Mysore District. Data were collected using rating scales designed to assess teaching behaviour and perceived teacher behaviour. Mean, Median, Standard Deviation, 't' test and Pearson's Product-Moment Correlation Coefficient were used for data analysis. The findings revealed that the teaching behaviour of teacher educators was at a relatively favourable level, with a mean score of 101.57 and standard deviation of 15.96. The perceived teacher behaviour of teacher educators was also found to be relatively favourable, with a mean score of 115.83 and standard deviation of 12.47. The study found no significant difference in teaching behaviour scores as perceived by student teachers. Further, a statistically significant positive relationship was found between teaching behaviour and perceived teacher behaviour). The study highlights the importance of reflective practice, professional development and continuous improvement of teacher educators for enhancing the quality of teacher education.

Introduction

Teacher education plays a vital role in strengthening the quality, effectiveness, and professionalism of the school education system. Teacher educators occupy a significant position in this process because they are responsible for preparing prospective teachers with the knowledge, skills, attitudes, values, and professional competencies required for effective classroom practice. At the secondary level, where learners experience important academic, emotional, social, and developmental transitions, the quality of teachers' classroom behaviour becomes particularly significant. Consequently, understanding the teaching behaviour of teacher educators and how they perceive their own professional behaviour is essential for improving teacher education programmes and strengthening the preparation of secondary school teachers.

Teaching behaviour refers to the observable professional actions, practices, interactions, and instructional strategies demonstrated by a teacher during the teaching-learning process. It encompasses several dimensions, including lesson planning, presentation of subject matter, classroom management, questioning, reinforcement, motivation, communication, interaction with learners, use of teaching methods and resources, assessment practices, and provision of feedback. Effective teaching behaviour creates a supportive learning environment and contributes to learners' academic engagement and overall development. In teacher education, the behaviour demonstrated by teacher educators can also serve as a model for prospective teachers, who often internalize and reproduce the instructional practices they observe.

Perceived teacher behaviour, on the other hand, refers to how teachers or teacher educators understand and evaluate their own professional behaviour and instructional practices. Perception may be influenced by professional experience, academic qualifications, institutional environment, interpersonal relationships, professional expectations, and opportunities for professional development. A teacher educator's perception of his or her own behaviour may not always correspond completely with the behaviour actually demonstrated in practice. Therefore, examining the relationship between teaching behaviour and perceived teacher behaviour can provide meaningful insights into the degree of consistency between observed professional practices and self-perceptions.

In the contemporary educational context, teacher educators are expected to move beyond traditional transmission-oriented approaches and adopt learner-centred, reflective, inclusive, technology-supported, and competency-based pedagogical practices. National and international developments in teacher education have emphasized reflective practice, professional competence, continuous professional development, collaborative learning, and the effective integration of technology into teaching. These changing expectations make it important to examine the behavioural dimensions of teacher educators and their perceptions of their own teaching practices.

The present study, entitled **"A Correlational Study of Teaching Behaviour and Perceived Teacher Behaviour among Teacher Educators at the Secondary Level in Mysore District"** attempts to examine the relationship between teaching behaviour and perceived teacher behaviour among teacher educators involved in secondary-level teacher education. A correlational approach is particularly appropriate for determining the nature and degree of association between these variables without manipulating them. The findings of the study may provide useful insights for teacher education institutions, policymakers, administrators, and teacher educators in identifying areas requiring professional development and reflective improvement. Ultimately, understanding the relationship between actual teaching behaviour and perceived teacher behaviour can contribute to enhancing the quality of teacher education and, consequently, the effectiveness of secondary school teaching and learning.

Present Status of the Study

The present study, entitled **"A Correlational Study of Teaching Behaviour and Perceived Teacher Behaviour among Teacher Educators at the Secondary Level in Mysore District"** focuses on understanding the existing relationship between teacher educators' actual teaching behaviour and their perception of their own professional behaviour. In the present educational context, teacher educators are increasingly expected to demonstrate effective pedagogical practices, learner-centred approaches, professional competence, reflective practices, appropriate classroom interaction, and effective use of instructional resources. However, there may be differences between the teaching behaviour demonstrated in practice and the behaviour perceived by teacher educators themselves. The present status of the study therefore emphasizes the need to examine this relationship systematically among teacher educators involved in secondary-level teacher education. The study is being undertaken in Mysore District to obtain empirical evidence regarding the nature and degree of correlation between the two variables. The findings are expected to provide useful insights for improving professional development, reflective teaching practices, institutional support, and the overall quality of teacher education.

Objectives of the Study

1. To assess the teaching behaviour of teacher educators at the secondary level as perceived by student teachers in Mysore District.
2. To assess the perceived teacher behaviour of teacher educators at the secondary level in Mysore District.
3. To study whether there is any relationship between the teaching behaviour and perceived teacher behaviour of teacher educators at the secondary level in Mysore District.

Hypotheses of the Study

1. There is a significant difference in the teaching behaviour scores of teacher educators as perceived by student teachers at the secondary level in Mysore District.
2. There is a significant relationship between the teaching behaviour and perceived teacher behaviour of teacher educators at the secondary level in Mysore District.

Methodology of the Study

The present study adopts a **descriptive survey method with a correlational research design** to examine the relationship between teaching behaviour and perceived teacher behaviour among teacher educators at the secondary level in Mysore District. The survey method is considered appropriate as the study seeks to collect systematic information regarding the existing teaching practices and perceptions of teacher educators without manipulating any of the study variables.

Variables in the Study

In the present study the variables taken into consideration by the investigator are:

- Teaching Behaviour
- Perceived Teacher Behaviour

Population and Sample of the Study

The **population of the study** comprises teacher educators and student teachers associated with secondary-level teacher education institutions in Mysore District. An appropriate sample of teacher educators and student teachers will be selected using a suitable sampling technique, depending on the availability and characteristics of the institutions. Data will be collected from student teachers to assess the teaching behaviour of teacher educators and from teacher educators to examine their perceived teacher behaviour.

The sample of the present study consisted of 40 teachers educators and 200 student teachers of Mysore district's B.Ed. institutions.

Tools Used in the Study

The present study has employed the following two tools for the study:

- A rating scale to measure Teaching Behaviour of teacher educators as perceived by the student teachers whom they are training.
- A rating scale to measure the perception of Teacher Behaviour of teacher educators as perceived by themselves.

Procedure for Data Collection

The investigator visited the institutions selected for the study and administered the validated tool the rating scales.

Statistical Techniques Used in the Study

1. **Descriptive Statistics:** Descriptive statistical procedures namely Mean, Median and Standard Deviation were used to analyze the data.
2. **Inferential Statistics:** In the present study, the Inferential Statistics Pearson's Product Moment Correlation (r) and 't' values were used.

Analysis and Interpretation of the Data

Analysis and Interpretation of Objective One

The first objective was to assess the teaching behaviour of teacher educators at the secondary level as perceived by student teachers in Mysore District.

The analysis and interpretation of this objective has been done by using descriptive statistics Mean, Median, Standard Deviation and Smoothed Frequency. Frequency distribution of scores on Teaching Behaviour is given in the below Table.

Table-1: Frequency distribution of the scores on teaching behaviour of teacher educators as perceived by the student teachers at Primary level.

Class Interval	Mid Point	Frequency	Smoothed Frequency
34-43	38.5	2	1
44-53	48.5	1	4
54-63	58.5	9	6.3
64-73	68.5	9	14
74-83	78.5	24	29.6
84-93	88.5	56	57
94-103	98.5	91	88.3

104-113	108.5	118	92.6
114-123	118.5	69	69.3
124-133	128.5	21	30

Mean, Median, Standard Deviation and Skewness were calculated for the distribution of scores on Teaching Behaviour. The results are given the below table.

Table-2: Number (N), Mean (M), Median (Mdn), Standard Deviation (SD) and Skewness (Sk) of the distribution of scores on Teaching Behaviour.

Variable	N	Max. Score	M	Mdn	SD	Sk	Q1	Q3
Teaching Behaviour	200	132	101.57	104	15.96	-0.45	93.3	112.6

Interpretation

From the above table it is observed that the N, Mean, Median, Standard Deviation, Skewness, Q1 and Q3 of the distribution of scores on Teaching Behaviour among 200 respondents. The maximum possible score on the Teaching Behaviour scale is 132. The obtained Mean score is 101.57, while the Median is 104, indicating that the scores are generally concentrated around the higher end of the distribution. The Standard Deviation of 15.96 indicates a moderate amount of variability in the Teaching Behaviour scores among the respondents.

The Skewness value is -0.45, indicating a slightly negatively skewed distribution. Since the Skewness value is relatively close to zero, the distribution may be considered approximately normal, with a slight tendency for scores to be concentrated towards the higher end. The first quartile (Q1) is 93.3, indicating that approximately 25% of the respondents obtained scores below this value, whereas the third quartile (Q3) is 112.6, indicating that approximately 75% of the respondents scored below this value. Thus, the middle 50% of the respondents obtained Teaching Behaviour scores between 93.3 and 112.6.

The findings indicate that the Teaching Behaviour scores of the respondents are relatively high, as reflected by the mean score of 101.57 out of a maximum score of 132. The closeness of the mean and median suggests that the distribution is reasonably balanced, although the negative skewness indicates a slight concentration of scores towards the higher end. The moderate standard deviation shows that there is some variation in the teaching behaviour scores among the respondents. Overall, the distribution suggests that the teacher educators demonstrated a favourable level of teaching behaviour, as perceived by the respondents.

Hypothesis One

H1: There is a significant difference in the teaching behaviour scores of teacher educators as perceived by student teachers at the secondary level in Mysore District.

In order to test the hypothesis, the null hypothesis was formulated and selected.

H0: There is no significant difference in the teaching behaviour scores of teacher educators as perceived by student teachers at the secondary level in Mysore District.

't' test was employed to test the null hypothesis with a level of significance set at 2.58 for the level of significance at 0.01 level with degrees of freedom 398 and the results are given in the below table.

Table-3: Mean (M), Standard Deviation (SD) and't' value of the scores of Mysore District on teaching behaviour of teacher educators as perceived by the student teachers.

District	M	SD	't' Value	Significant Level
Mysore	102.59	14.46	1.0377	Not Significant at 0.01 level

Interpretation

The above table presents the mean, standard deviation, and *t* value of the teaching behaviour scores of teacher educators as perceived by student teachers in Mysore District. The obtained **Mean score is 102.59**, with a **Standard Deviation of 14.46**. The calculated *t* value is **1.0377**, which is **not significant at the 0.01 level**. Since the obtained *'t'* value is not statistically significant at the 0.01 level, the null hypothesis is **accepted**. This indicates that there is **no statistically significant difference in the teaching behaviour scores** of teacher educators as perceived by the student teachers in the study. The finding suggests that the teaching behaviour of teacher educators, as perceived by student teachers, is relatively consistent and does not show a statistically significant variation.

Conclusion

The study found that **there is no significant difference in the teaching behaviour of teacher educators at the secondary level as perceived by student teachers in Mysore District**. Therefore, the **null hypothesis is accepted**.

Analysis and Interpretation of Objective Two

The second objective was to assess the perceived teacher behaviour of teacher educators at the secondary level in Mysore District.

The analysis and interpretation of this objective has been done by using descriptive statistics, namely, Mean, Median, Standard Deviation and Smoothed Frequency. Frequency distribution of the scores on Teacher Behaviour perception is given in the below table.

Table-4: Frequency distribution of the scores on perceived teacher behaviour of teacher educators at secondary level.

Class Interval	Mid-Point	Frequency	Smoothed Frequency
94-103	98.5	10	5.3
104-113	108.5	6	8
114-123	118.5	8	9.6
124-133	128.5	15	8
134-143	138.5	1	5.3

Mean, Median, Standard Deviation and Skewness were calculated for the distribution of scores on perceived teacher behaviour. The results are given the below table.

Table-5: Table 4.10: Number (N), Mean (M), Median (Mdn), Standard Deviation (SD) and Skewness (Sk) of the distribution of scores on Perceived Teacher Behaviour.

Variable	N	M	Mdn	SD	Sk	Q1	Q3
Perceived Teacher Behaviour	40	115.83	116.5	12.47	-0.26	93.5	127.5

Interpretation

The above table presents the **Mean (M), Median (Mdn), Standard Deviation (SD), Skewness (Sk), First Quartile (Q1) and Third Quartile (Q3)** of the scores obtained on **perceived teacher behaviour** for a sample of 40 teacher educators.

The **Mean score is 115.83**, while the **Median score is 116.5**, indicating that the scores are concentrated around a relatively high level of perceived teacher behaviour. The **Standard Deviation of 12.47** indicates a moderate degree of variability among the respondents' scores.

The obtained **Skewness value is -0.26**, which indicates a slight negative skewness in the distribution. Since the value is close to zero, the distribution can be considered **approximately symmetrical and reasonably close to a normal distribution**. The negative value suggests a slight concentration of scores towards the higher end of the scale.

The **first quartile (Q1) is 93.5**, indicating that approximately 25% of the respondents obtained scores below 93.5. The **third quartile (Q3) is 127.5**, indicating that approximately 75% of the respondents obtained scores below 127.5. Thus, the middle 50% of the respondents obtained scores between **93.5 and 127.5**.

The findings indicate that the **perceived teacher behaviour among the teacher educators is relatively high**, as reflected in the mean score of 115.83. The closeness of the mean and median suggests that the distribution is fairly balanced. The low negative skewness further indicates that the distribution is approximately normal. Overall, the results suggest that the teacher educators possess a **favourable level of perceived teacher behaviour**, with moderate variation among the respondents.

Analysis and Interpretation of Objective Three

The third objective was To study whether there is any relationship between the teaching behaviour and perceived teacher behaviour of teacher educators at the secondary level in Mysore District.

The data pertaining to this objective were analysed using Mean and Standard Deviation as descriptive statistics, and the Pearson Product-Moment Correlation Coefficient (r) was computed to determine the relationship between the scores. The Mean, Standard Deviation, r' value, and level of significance are presented in the following table.

Table-6: Mean (M), 'r' value and level of significance of the Teaching Behaviour and Perceived Teacher Behaviour and of teacher educators.

Variables	N	Mean	'r' value	Significant Level
Teaching Behaviour	200	101.57	0.2097	Significant at 0.01 level
Perceived Teacher Behaviour	40	115.83		

Hypothesis Two

H2: There is a significant relationship between the teaching behaviour and perceived teacher behaviour of teacher educators at the secondary level in Mysore District.

In order to test the hypothesis, the null hypothesis was formulated and selected.

H0: There is no significant relationship between the teaching behaviour and perceived teacher behaviour of teacher educators at the secondary level in Mysore District.

Interpretation

The above table presents the **Mean and Pearson Product-Moment Correlation Coefficient (r)** between teaching behaviour and perceived teacher behaviour of teacher educators at the secondary level in Mysore District. The mean score for **Teaching Behaviour is 101.57**, whereas the mean score for **Perceived Teacher Behaviour is 115.83**. The obtained correlation coefficient is **r = 0.2097**, which is reported as **significant at the 0.01 level**.

Since the obtained *'r'* value is statistically significant at the 0.01 level, the null hypothesis **(H_0)** stating that "There is no significant relationship between teaching behaviour and perceived teacher behaviour" is **rejected**. Therefore, the research hypothesis "There is a significant relationship between the teaching behaviour and perceived teacher behaviour of teacher educators at the secondary level in Mysore District" is **accepted**.

The positive value of '*r'* indicates that there is a **positive relationship** between teaching behaviour and perceived teacher behaviour. This implies that higher levels of teaching behaviour tend to be associated with higher levels of perceived teacher behaviour among teacher educators. However, the magnitude of the correlation (**r = 0.2097**) indicates a **weak positive relationship** between the two variables.

The study reveals that there is a statistically significant positive relationship between teaching behaviour and perceived teacher behaviour among teacher educators at the secondary level in Mysore District ($r = 0.2097$, $p < 0.01$). Hence, the null hypothesis is rejected and the research hypothesis is accepted.

Major Findings of the Study

1. The finding suggests that the teaching behaviour of teacher educators, as perceived by student teachers, is relatively consistent and does not show a statistically significant variation. **There is no significant difference in the teaching behaviour of teacher educators at the secondary level as perceived by student teachers in Mysore District**.

2. The Perceived Teacher Behaviour of teacher educators of Mysore District is at average level.
3. **There is a statistically significant positive relationship between teaching behaviour and perceived teacher behaviour among teacher educators at the secondary level in Mysore District.**

Educational Implications of the Study

1. Teacher educators should be provided with regular professional development programmes to improve pedagogical knowledge, teaching skills, classroom interaction and professional competencies.
2. Teacher educators should be encouraged to reflect systematically on their teaching practices and compare their self-perceptions with feedback received from student teachers.
3. Feedback from student teachers can be used as an important mechanism for identifying strengths and areas requiring improvement in the teaching behaviour of teacher educators.
4. Teacher educators should adopt learner-centred, participatory and interactive approaches that encourage active involvement, critical thinking and collaborative learning among student teachers.
5. Since teacher educators serve as role models for prospective teachers, emphasis should be placed on effective communication, questioning, reinforcement, motivation and constructive classroom interaction.
6. Teacher educators should be encouraged to integrate appropriate digital technologies and instructional resources into the teaching-learning process.
7. Teacher education institutions should provide adequate academic, technological and administrative support for continuous professional development and improvement in teaching practices.
8. The positive relationship between teaching behaviour and perceived teacher behaviour indicates the need to promote consistency between actual professional practices and teachers' perceptions of their own behaviour. Such consistency can contribute to improving the overall quality of teacher education and the preparation of effective secondary school teachers.

Suggestions for Further Research

1. Similar studies may be conducted with a larger sample covering teacher educators and student teachers from different districts of Karnataka.
2. A comparative study may be undertaken between government, aided and private teacher education institutions.
3. Similar research may be conducted at the primary, secondary and higher education levels to examine variations in teaching behaviour and perceived teacher behaviour.
4. Future studies may examine the relationship of teaching behaviour with other variables such as emotional intelligence, teaching competency, job satisfaction, professional commitment, digital literacy and teaching attitude.

5. An experimental study may be conducted to examine the effectiveness of specific professional development programmes in improving the teaching behaviour of teacher educators.
6. Future researchers may use qualitative methods, such as classroom observation, interviews, focus-group discussions and case studies, to obtain deeper insights into the teaching behaviour of teacher educators.

Limitations of the Study

1. The study was confined to teacher education institutions in Mysore District, and therefore the findings may not be directly generalisable to other districts or states.
2. The sample consisted of 40 teacher educators and 200 student teachers, which may limit the extent to which the findings can be generalised to a larger population.
3. The study employed a descriptive survey and correlational research design; therefore, the findings establish an association between the variables but do not establish a cause-and-effect relationship.
4. The study relied primarily on rating scales for data collection. Hence, factors such as social desirability and subjective interpretation of the items may have influenced the responses.
5. The study was limited to the variables of teaching behaviour and perceived teacher behaviour and did not include other potentially relevant variables such as teaching competency, emotional intelligence, job satisfaction, professional commitment or digital competence.
6. The study represents the teaching behaviour and perceptions of respondents during the period of data collection and may not fully reflect changes in professional behaviour over a longer period.

IMPACT OF SOFT SKILLS ON EMPLOYABILITY READINESS: AN EMPIRICAL STUDY AMONG UNDERGRADUATE STUDENTS

Anushka Patel
[1]*Research Scholar, University of Lucknow, Lucknow, Uttar Pradesh*
Dr. Zayara Zaidi
[2]*Assistance Professor, Arya Kanya Mahavidyalaya, Hardoi, Uttar Pradesh*

Abstract

In today's competitive and rapidly evolving job market, developing soft skills is essential alongside academic qualifications to ensure students' employability. Soft skills such as communication, teamwork, leadership, problem-solving, adaptability, and time management play a crucial role in preparing individuals to meet workplace expectations. This study aims to assess the level of soft skills among undergraduate students and examine the impact of these skills on their employability readiness. The study employs a descriptive survey method, with primary data collected via a structured questionnaire. Key dimensions included in the soft skills assessment were communication, teamwork, problem-solving, leadership, adaptability, and time management. The collected data were analyzed using appropriate descriptive and statistical techniques. The findings reveal a satisfactory level of soft skills among students and indicate a positive correlation between soft skills and employability readiness. The results suggest that students possessing superior soft skills are better prepared to meet the demands of employment. The study highlights the need for the systematic development of soft skills alongside academic and technical knowledge within higher education institutions. Based on these findings, educational institutions should focus on strengthening students' soft skills through curricula, training programs, workshops, internships, and experiential learning activities to enhance their employability readiness.

Keywords: *Soft skills, employability readiness, undergraduate students, employability, skill development, higher education*.

Introduction

In the present era, rapid changes driven by technological advancements, shifting socio-economic conditions, and industrial evolution have significantly altered workplace demands and working methods. In the 21st century, employers require employees who are not only proficient in technical skills)those specific to a particular field(but also adept at soft skills)Tushar & Sooraksha, 2023). Industry 4.0 has adopted technologies such as large-scale automation, the Internet of Things (IoT), big data, cloud computing, artificial intelligence, and machine learning within the industrial sector. It not only enhances productivity but also equally incorporates human values such as creativity, emotional intelligence, ethical decision-making, social responsibility, and sustainable development. Therefore, in today's times, the development of soft skills alongside technical skills has become essential for employability.

The National Education Policy 2020 also advocates for promoting skill-based education, experiential learning, internships, and industry-academia collaboration. Furthermore, various national reports such as the India Skills Report and studies published by AICTE and NASSCOM have highlighted a lack of soft skills among many graduates. Consequently, industries struggle to find suitable human resources, while educated youth continue to face the problem of unemployment. Employability skills are those skills that help an individual secure and retain a job, and enable them to adapt to a changing work environment. One of the major obstacles regarding graduate employability in the higher education sector is the gap between their employability skills and the skills required to meet workplace expectations. In the 21st century, academic knowledge alone is not sufficient to meet workplace expectations; practical skills are also essential)Surata & Suwintana, 2017).

This subject often remains challenging for policymakers, practitioners, and researchers due to the lack of a clear definition of soft skills and a conceptual framework for understanding them. Most educational institutions place greater emphasis on academic qualifications, leaving students unclear about which skills and capabilities they should focus on to enhance their employability. Consequently, graduates often fail to adequately meet the expectations of the workplace. The main problem is that the currently available theoretical frameworks do not provide sufficient guidance regarding employability skills—specifically, on which attributes the assessment of employee employability should focus and which qualities require adequate attention. Many scholars have attempted to classify soft skills from the perspective of the workplace environment and the demands of a changing labor market, encompassing skills such as critical thinking, problem-solving, creativity, adaptability, communication skills, teamwork, leadership qualities, and decision-making ability. These skills assist graduates in making the right decisions at the right time, working within a group and providing it with direction, and adjusting to new work environments.

Related literature Review

Mainga et al. (2022), in a study on the perceptions of final-year business students regarding employability, found that communication skills, learning skills, a positive attitude, and problem-solving skills are considered the most important competencies for securing an entry-level job. The study also revealed that, at the time of graduation, students were generally satisfied with their academic, personal management, and teamwork skills—particularly regarding critical thinking, self-reliance, and collaboration. However, deficiencies were still observed in areas such as creativity, innovation, time management, and conflict resolution skills. The study's findings indicate that the combined use of traditional teaching methods and student-centered learning contributes positively to the development of employability skills. Additionally, the influence of external labor market conditions on students' perceived employability was also observed.

Suarta et al. (2017) conducted a critical review of the literature on employability skills and found that employers now place great importance on employability skills alongside technical knowledge and academic qualifications. According to the study, communication skills,

problem-solving and decision-making skills, and teamwork skills are the most crucial competencies for the employability of graduates. Furthermore, employers have also attached great importance to personal attributes such as self-awareness, self-confidence, adaptability, emotional intelligence, creativity, initiative, lifelong learning, and professional conduct. The findings suggest that higher education institutions should place special emphasis on developing transferable skills alongside technical skills, so that graduates become better equipped to meet the demands of the changing labor market.

Berniak-Woźny et al. (2023) conducted a study on 755 students in Poland regarding their perceptions of employability and work-related skills; they found that digital proficiency, innovative and adaptive thinking, virtual collaboration, and emotional intelligence were considered the most important competencies for future career success. The study also revealed differences in the prioritization of these competencies based on gender, employment status, and field of study. Furthermore, there is a clear gap between students' understanding of these competencies and their actual skill levels. Researchers concluded that higher education institutions should further strengthen students' digital literacy, soft skills, interdisciplinary learning, and experiential learning so that they can be better prepared to meet the demands of the rapidly evolving digital workplace.

Need and Significance of the Study

The skill gap existing between higher education institutions and industry requirements in India is exacerbating the issues of youth unemployment and underemployment. Although the National Education Policy (NEP 2020) emphasizes skill-based education and industry-academia collaboration, empirical studies regarding the relationship between soft skills development and students' employability readiness remain relatively limited. This study aims to analyze the impact of various dimensions of soft skills on the employability readiness of graduates. The study's findings will prove useful in guiding higher education institutions to make necessary improvements to curricula and training programs, helping students develop themselves in line with job market expectations, enabling employers to identify suitable talent, and assisting policymakers in formulating effective skill development policies. Furthermore, this study will make a significant contribution to the existing literature on soft skills and employability readiness, and will help provide a solid foundation for future research.

Objectives of the Study

1. To assess the level of soft skills among undergraduate students.
2. To examine the impact of soft skills on employability readiness among undergraduate students.

Research Questions

1. What is the level of soft skills among undergraduate students?
2. To what extent do soft skills influence employability readiness among undergraduate students?

Hypothesis

H_0: There is no significant impact of soft skills on employability readiness among undergraduate students.

Variables of the Study

Independent Variable: Soft Skills are the independent variable because they are expected to influence employability readiness.

Dimensions of Soft Skills

- Communication Skills
- Teamwork
- Leadership
- Problem-Solving
- Adaptability

Dependent Variable: Employability Readiness

Delimitations of the Study

1. Only final-year undergraduate students have been included in the study.
2. Only 200 (100 male and 100 female) students have been selected as the sample.
3. Colleges from one district of Uttar Pradesh (Hardoi) have been included in the study.

Research Methodology

The present research is descriptive in nature. Its objective is to study the employability skills of higher education students and to examine the differences and relationships existing among them based on various variables.

Research design

In the present study, a survey method has been used to collect information from undergraduate students regarding their employability skills.

Population and Sample

For the present study, students pursuing higher education in colleges across Uttar Pradesh constitute the population, and a sample of 200 students was selected.

Research Instrument

A researcher-developed questionnaire (5 point Likert scale) was used to measure employability readiness for the study. This instrument encompasses dimensions such as communication, teamwork, leadership, problem-solving, adaptability.

Reliability

The present study was tested through a pilot study conducted prior to the main study. Based on the results, the reliability of the Soft Skills Scale was found to be:

Soft Skills – 0.86

Employability Readiness – 0.92

Validity

The validity of the research instrument was established through:

- Face Validity
- Content Validity

- Construct Validity

Statistical Techniques Used

The following statistical techniques were used in the study: Frequency, Percentage, Mean, Standard Deviation, Pearson's Correlation Coefficient, and Simple Linear Regression Analysis.

Data analysis and Interpretation

In this study, key dimensions such as communication skills, teamwork, leadership skills, problem-solving skills, and adaptability were analyzed to assess the level of soft skills among undergraduate students.

Objective of the study

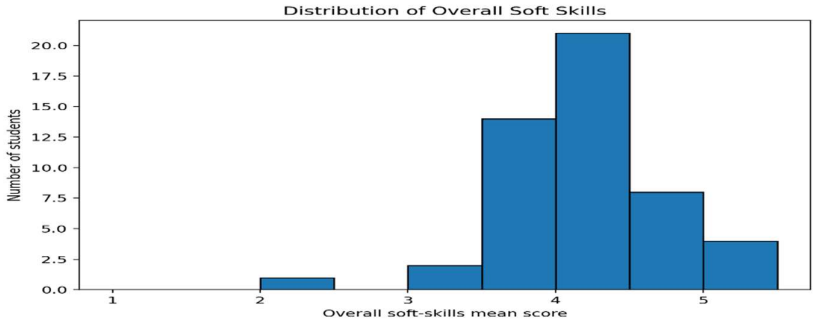
Objective 1. To assess the level of soft skills among undergraduate students.

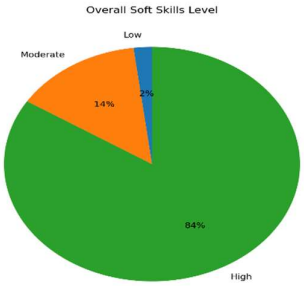
Table 1: **Various Dimensions of Soft Skills**

Soft Skill	Mean	SD	Level
Communication	4.196	0.572	High
Teamwork	4.164	0.555	High
Leadership	4.140	0.592	High
Problem-Solving	4.128	0.587	High
Adaptability	3.992	0.687	High
Overall Soft Skills	4.123	0.542	High

Analysis of the collected data revealed that the mean score for the students' overall soft skills was 4.123, with a standard deviation of 0.542, indicating a high level of soft skills. Among the various dimensions, communication skills recorded the highest mean score (M = 4.196, SD = 0.572), followed by teamwork (M = 4.164, SD = 0.555), leadership skills (M = 4.140, SD = 0.592), problem-solving skills (M = 4.128, SD = 0.587), and adaptability (M = 3.992, SD = 0.687). Although the mean score for adaptability was lower compared to the other dimensions, it still fell within the high-level category.

Graph-1: Graphical representation of the level of soft skills





Pie-chart- 1.1

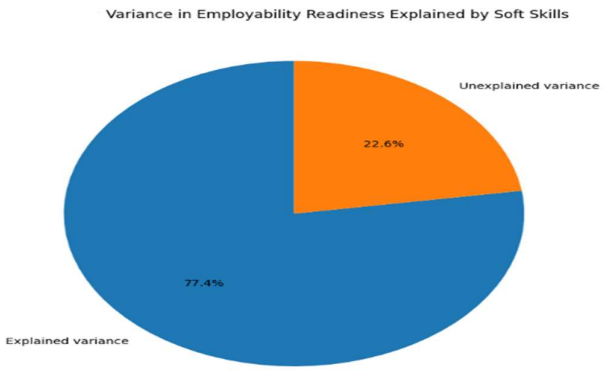
Level-wise analysis further revealed that out of the total 200 students, 168 (84%) possessed a high level of soft skills, 28 (14%) were at a moderate level, and only 4 (2%) fell into the low-level category. Thus, it can be concluded that the majority of the undergraduate students included in the study demonstrated a high level of soft skills.

Objective 2. To examine the impact of soft skills on employability readiness among undergraduate students.

To examine the relationship between skills and employability, Pearson correlation coefficient and simple linear regression analysis were used for this objective.

Graph 2: Graphical representation of **relationship between skills and employability**

Pie-chart-1.2



Data analysis revealed a positive and statistically significant relationship between soft skills and employability ($r = .870$, $p < .001$). This indicates that students with higher soft skills tended to exhibit greater employability. Furthermore, simple linear regression analysis showed that the regression model was statistically significant, $F(1, 48) = 150.006$, $p < .001$. The model's R^2 value was found to be .758, implying that approximately 75.8 percent of the variation in employability scores within the study sample was statistically explained by soft skills scores. The regression coefficient for soft skills was also positive and statistically significant ($B = 0.925$, $t = 12.248$, $p < .001$).

H_0: There is no significant impact of soft skills on employability readiness among undergraduate students.

The Pearson Product-Moment Correlation was used to test the null hypothesis. The obtained p-value is less than the established significance level of 0.05. Therefore, the relationship found between soft skills and employability is statistically significant. Based on this, the null hypothesis (H_0) is rejected.

In conclusion, soft skills serve as a strong and statistically significant predictor of employability among the undergraduate students included in the study. Students who demonstrated higher levels of soft skills also exhibited higher levels of employability.

Conclusion: The primary objective of this study was to assess the level of soft skills among undergraduate students and to examine the relationship between soft skills and employability readiness, as well as the predictive capacity of soft skills. To this end, key dimensions of soft skills—such as communication skills, teamwork, leadership skills, problem-solving skills, and adaptability were studied. Data analysis revealed that the overall level of soft skills among undergraduate students was high. The students' average overall soft skills score was 4.123. A level-wise analysis showed that 84% of the students fell into the high soft skills category, 14% into the moderate category, and 2% into the low category. This indicates that soft skills are being adequately developed in the majority of the undergraduate students included in the study. Analysis of the various dimensions of soft skills revealed that communication skills had the highest average score. This was followed by good scores in teamwork, leadership skills, and problem-solving skills; while the average score for adaptability was relatively lower compared to the other dimensions, it still fell within the high-level category. Thus, it can be concluded that students generally possess high-level capabilities regarding communication, collaboration, leadership, problem-solving, and the ability to adapt to changing circumstances. The study's second objective involved examining the relationship between soft skills and employability readiness. The analysis revealed a positive relationship between the two variables; specifically, students with higher levels of soft skills generally exhibited higher levels of employability readiness. Consequently, the study's results indicate a positive correlation between soft skills and employability readiness. Regression analysis identified soft skills as a significant predictor of employability readiness. The model explained approximately 77.4 percent of the variance in employability readiness through soft skills scores ($R^2 \approx .774($, while approximately 22.6 percent of the variance remained

unexplained by the model. This indicates a strong statistical relationship between soft skills and the employability of students, although employability can also be influenced by other personal, educational, social, and professional factors. Overall, the study concludes that undergraduate students possess a high level of soft skills and that a positive relationship exists between soft skills and employability. Therefore, it would be beneficial for higher education institutions to place continuous emphasis on developing students' communication skills, teamwork, leadership, problem-solving abilities, and particularly adaptability, alongside their academic knowledge. Students' workplace readiness can be further strengthened by integrating soft skills into curricula, training programs, group activities, presentations, project work, internships, and employment-oriented activities. Ultimately, the study demonstrates that soft skills are closely linked to the employability of undergraduate students and play a significant role in understanding their readiness for employment. However, as the current study is survey-based and cross-sectional in nature, the observed relationships should not be interpreted as direct causal effects.

Recommendations

Based on the findings, the following suggestions are proposed:

1. Make soft skills an integral part of the curriculum.
2. Focus specifically on developing adaptability.
3. Link communication skills to professional contexts.
4. Increase practical opportunities for teamwork and leadership.
5. Develop problem-solving and decision-making capabilities.
6. Organize employability training programs.
7. Enhance collaboration between industry and higher education institutions.
8. Periodically assess students' soft skills.
9. Strengthen the role of teachers.
10. Bolster career guidance and placement support.
11. Tailor skill development to individual needs.
12. Prioritize the link between soft skills and employability readiness at the institutional level.

Suggestions for Future Research

Future studies could utilize larger and more diverse samples compared to the present study. Comparative studies could be conducted by including students from various universities, academic programs, urban and rural areas, as well as public and private higher education institutions. Additionally, longitudinal or experimental research designs could be employed to examine how specific soft-skills training programs influence students' employability readiness over time. Future research could also investigate employability readiness more comprehensively by incorporating factors such as internship experience, academic achievement, digital skills, career self-efficacy, and other relevant variables.

SKILL DEVELOPMENT AND EMPLOYABILITY: AN EMPIRICAL STUDY OF SKILLS, TRAINING, AND EMPLOYMENT READINESS AMONG YOUNG ADULTS

Dr. Neetha. A. J,
Principal, B.E.A. College of Education, Davangere-577004. E-mail id: ajneetha@gmail.com

Abstract

Skill development has become a central requirement for improving employability in economies experiencing technological change, changing occupational structures, and increasing competition for jobs. Educational qualifications provide foundational knowledge, but employers increasingly expect graduates and job seekers to demonstrate practical, digital, communication, problem-solving, teamwork, and adaptive capabilities. This research paper examines the relationship between skill development and employability, with particular attention to the role of training, practical exposure, digital competence, and soft skills. A descriptive empirical design was adopted. Primary data were collected through a structured questionnaire from 100 young adults aged 18–30 who were students, recent graduates, or early-career job seekers. Respondents were selected through convenience sampling. The findings indicate that practical training, internships, digital skills, communication abilities, and career guidance are perceived as important contributors to employment readiness. The study also identifies a gap between academic learning and workplace expectations. Respondents who reported greater exposure to practical training generally expressed higher confidence in job-related competencies. The paper concludes that employability can be strengthened when educational institutions, employers, training providers, and government agencies work together to provide accessible, relevant, and continuously updated skill development opportunities.

Keywords: *skill development, employability, vocational training, digital skills, soft skills, youth employment, workplace readiness.*

Introduction

Education, skills, and employment are increasingly interconnected in a changing labour market. Technology, automation, globalization, and new business models have altered work. Employers seek people who can apply knowledge, communicate, solve problems, use digital tools, collaborate, and learn continuously. Employability therefore depends not only on qualifications but also on translating knowledge into workplace performance.

Skill development refers to the process of acquiring, improving, and updating competencies required for personal, professional, and economic participation. These competencies may be technical, vocational, digital, interpersonal, managerial, or entrepreneurial. Employability refers broadly to the knowledge, skills, attitudes, and personal attributes that enable an individual to obtain employment, perform effectively, adapt to changing work requirements, and progress in a career. The two concepts are closely connected, although employability also depends on labourmarket conditions, experience, social networks, career opportunities, and individual circumstances.

In India, the importance of skill development is particularly significant because of the country's large young population and the continuing need to create productive employment opportunities. National programmes have encouraged vocational education, apprenticeships, entrepreneurship, digital learning, and industry-oriented training. Nevertheless, concerns remain about the mismatch between what students learn and what employers require. Many graduates possess theoretical knowledge but lack practical exposure, workplace communication, confidence, or familiarity with current technologies.

This study therefore investigates perceptions of skill development and employability among young adults. It focuses on the perceived usefulness of practical training, internships, digital competencies, soft skills, career guidance, and industry interaction. It also examines whether exposure to skill-development activities is associated with greater confidence in employment readiness.

Review of Literature

Employability has been examined from individual, educational, and labour-market perspectives. Yorke (2006) describes employability as a set of achievements that makes graduates more likely to gain employment and succeed in chosen occupations. This perspective emphasizes that employability is broader than simply obtaining a job. It includes transferable abilities, understanding of professional contexts, and capacity for lifelong learning.

Tomlinson (2017) argues that graduate employability is increasingly shaped by forms of capital that individuals develop through education and experience. Academic qualifications remain important, but students also benefit from social, cultural, psychological, and identity-related resources. Work experience, professional networks, confidence, and knowledge of recruitment processes can influence employment outcomes.

The World Economic Forum has repeatedly highlighted the growing importance of analytical thinking, creativity, resilience, flexibility, technological literacy, and lifelong learning in changing labour markets. Such reports demonstrate that employers require combinations of technical and human skills rather than narrow occupational knowledge alone.

In the Indian context, skill development policies have emphasized improving the employability of youth through vocational training, apprenticeships, entrepreneurship, and industry-linked programmes. The National Skill Development Mission and related initiatives seek to expand opportunities for skill acquisition and improve alignment between training and labourmarket requirements. However, studies and policy discussions continue to identify challenges including uneven training quality, limited industry participation, inadequate career counselling, and differences in access between urban and rural learners.

Soft skills are especially important because employees frequently work in teams and communicate with customers, colleagues, managers, and external stakeholders. Communication, teamwork, leadership, time management, adaptability, and problem-solving influence workplace performance. At the same time, digital literacy has become a basic employability requirement across many occupations. Therefore, effective skill development

should combine occupational competence with transferable and digital capabilities.

Research Gap

Existing literature establishes a relationship between skills and employability, but evidence about young learners' perceptions remains useful. This study examines important skill areas, exposure to practical training, and whether such exposure influences confidence in employment readiness.

Objectives of the Study

The study has five objectives:

- To examine the perceived relationship between skill development and employability.
- To identify the skills considered most important for obtaining employment.
- To assess respondents' exposure to practical training, internships, and career guidance.
- To examine the perceived role of digital and soft skills in employment readiness.
- To suggest measures for improving skill-development programmes.

Research Methodology

Research Design: The study used a descriptive and empirical research design. It collected quantitative primary data through a structured questionnaire and used simple descriptive analysis to interpret respondents' views.

Population and Sample: The target population consisted of young adults aged 18–30, including college students, recent graduates, and early-career job seekers. A sample of 100 respondents was selected through convenience sampling. The sample was intended to provide an exploratory picture of perceptions rather than statistically represent all young adults.

Data Collection: Primary data were collected using a structured questionnaire administered in person and through an online form. Participation was voluntary. Respondents were informed that their responses would be used for academic research and that individual identities would not be reported. The questionnaire contained demographic questions and statements concerning skill development and employability. Responses to attitudinal statements were measured using a fivepoint Likert scale ranging from strongly disagree to strongly agree.

Variables: The major independent areas considered were practical training, internship exposure, digital skills, communication skills, problem-solving ability, teamwork, and career guidance. The dependent construct was perceived employability or employment readiness.

Data Analysis: The collected responses were coded and summarized using frequencies and percentages. Mean scores were also considered for selected Likert-scale items. A simple comparison was made between respondents with higher exposure to practical training and those with lower exposure. Because the sample was obtained through convenience sampling and the study was exploratory, findings were interpreted cautiously.

Data Analysis and Interpretation

The questionnaire data from 100 respondents produced the following broad profile. Sixtytwo respondents were female and thirty-eight were male. Fifty-eight respondents were aged 18–22, thirty-two were aged 23–26, and ten were aged 27–30. Fifty-six respondents were current students, twenty-eight were recent graduates, and sixteen were early-career job seekers.

Table 1: Perceived Importance of Selected Skills

Skill area	Respondents rating it important or very important
Communication skills	91%
Digital skills	89%
Problem-solving	88%
Technical/job-specific skills	87%
Teamwork	84%
Adaptability	83%
Time management	79%
Leadership	72%

The results show that communication skills received the highest rating, followed closely by digital skills and problem-solving. This indicates that respondents recognize employability as a multidimensional concept. Technical competence remains highly valued, but respondents also consider interpersonal and cognitive skills important.

Table 2: Exposure to Skill-Development Activities

Activity	Respondents with exposure
Short-term skill courses	64%
Internship/work experience	48%
Industry interaction or visits	41%
Career counselling	37%
Project-based practical learning	69%
Formal interview training	45%

The data reveal a clear difference between exposure to classroom or project-based activities and exposure to workplace-oriented experiences. Nearly seven in ten respondents reported projectbased practical learning, while fewer than half had internship experience, industry interaction, or formal interview training. This suggests that educational institutions may provide some practical activities without consistently connecting them to actual workplaces.

Respondents were also asked to rate their confidence in securing and performing in employment. Among those reporting regular exposure to practical training, 74% rated their employment readiness as high or very high. Among respondents with limited practical exposure, 49% gave the same rating. This difference suggests a positive association between practical exposure and perceived employability. It should not be interpreted as proof of causation because the study did not use random sampling or a controlled experimental design.

When asked about barriers to skill development, 61% identified lack of access to quality training, 54% cited cost, 47% mentioned insufficient information about suitable courses, 43% reported limited time, and 38% identified lack of career guidance. These responses indicate that the challenge is not simply willingness to acquire skills. Accessibility, affordability, information, and institutional support also influence participation.

A further question asked respondents which methods would most improve employability. Seventy-eight percent preferred internships or apprenticeships, 71% selected industry-oriented

projects, 67% preferred certification in relevant digital skills, 63% selected communication and interview training, and 59% wanted stronger career counselling. The pattern indicates a preference for experiential and employment-linked learning rather than purely theoretical instruction.

Findings

The first major finding is that respondents perceive skill development as essential for employability. More than four-fifths considered communication, digital competence, problem-solving, technical skills, teamwork, and adaptability important. This supports the view that employability requires a combination of technical and transferable capabilities.

The second finding is that practical exposure appears to be associated with stronger employment confidence. Respondents with regular practical training reported higher perceived readiness than those with limited exposure. Projects, internships, and workplace interaction can provide opportunities to apply knowledge, understand professional behavior, and receive feedback.

The third finding is the continuing importance of digital skills. Digital competence is no longer restricted to information-technology occupations. Office productivity tools, online collaboration, data handling, digital communication, and technology-assisted work are relevant to many sectors. Therefore, basic digital literacy should be integrated across programmes while advanced digital skills should be offered according to occupational needs.

The fourth finding concerns soft skills. Communication, teamwork, adaptability, and problem-solving were rated highly. These capabilities help individuals function effectively in diverse workplace situations. Training programmes that focus exclusively on technical content may therefore leave important employability gaps.

The fifth finding is limited access to workplace-linked opportunities. Less than half of respondents reported internship experience or industry interaction. This is significant because employers often value prior exposure to real work environments. Institutions should develop stronger partnerships with employers and provide structured opportunities for learners to observe and practice workplace tasks.

The sixth finding is that barriers to skill development are both economic and informational. Cost, lack of awareness, limited time, and insufficient counselling can prevent learners from selecting suitable programmes. Support mechanisms should therefore include affordable training, reliable information, flexible delivery, and personalized career guidance.

Discussion

The findings are consistent with the broader literature, which presents employability as a combination of knowledge, skills, experience, attitudes, and the capacity to adapt. A degree can demonstrate academic achievement, but employers also need evidence that applicants can perform practical tasks and respond to workplace demands.

The association between practical training and employment confidence is important. Experiential learning connects classroom concepts with real problems, while internships can develop discipline, communication, teamwork, and workplace awareness. Institutions should

focus on placement quality rather than treating internships as a formality.

Digital transformation makes continuous skill development increasingly necessary. Skills acquired several years earlier may become insufficient when software, processes, and occupational practices change. Educational institutions should therefore encourage lifelong learning and teach learners how to learn independently. Micro-credentials, short courses, online modules, workshops, and industry certifications can complement formal qualifications.

There is also a need to reconsider assessment. Conventional examinations mainly measure knowledge recall, whereas employability often requires application, analysis, communication, collaboration, and practical performance. Project-based assessments, presentations, case studies, simulations, portfolios, and competency demonstrations can provide better evidence of workplace readiness.

Suggestions

First, educational institutions should strengthen industry-academia collaboration. Employers can contribute to curriculum design, guest lectures, live projects, mentoring, internships, and assessments.

Second, practical learning should be integrated throughout programmes rather than concentrated at the end. Students should regularly solve realistic problems and use relevant tools.

Third, institutions should establish structured career-development services. Career counselling should begin before graduation and include career exploration, résumé preparation, interview practice, workplace communication, and information about further training.

Fourth, digital skills should be taught progressively. Basic digital literacy should be universal, while specialized skills should be aligned with disciplinary and occupational requirements.

Fifth, soft skills should be embedded into academic activities. Group projects, presentations, debates, collaborative assignments, leadership opportunities, and problem-based learning can develop these competencies naturally.

Sixth, training programmes should be accessible and affordable. Scholarships, flexible schedules, blended learning, community training centers, and publicly supported programmes can help learners from different backgrounds.

Seventh, employers should communicate skill requirements clearly. Regular employer feedback can help institutions identify emerging competencies and update curricula.

Finally, learners should take responsibility for continuous development. They should identify skill gaps, seek feedback, build portfolios, participate in projects, and remain open to new technologies and occupational changes

Conclusion

These results also highlight the importance of context-specific training.

Skill development is a critical foundation for employability. This empirical study of 100 young adults shows strong demand for communication, digital competence, problem-solving,

technical knowledge, teamwork, and adaptability. Practical training is positively associated with perceived employment readiness, while limited internships and industry interaction reveal a gap between education and workplace preparation.

Improving employability requires more than increasing the number of training programmes. Training must be relevant, practical, accessible, industry-informed, and continuously updated. Educational institutions, employers, government agencies, training organizations, and learners each have a role in this process. Institutions should create opportunities for experiential learning, employers should participate in curriculum and training, policymakers should support equitable access, and learners should pursue lifelong skill development.

The study has limitations. The sample was small and selected through convenience sampling, the findings are based partly on self-reported perceptions, and the analysis is descriptive.

Future research could use larger samples, probability sampling, longitudinal data, employer assessments, and statistical tests to examine whether specific skills predict actual employment outcomes. Nevertheless, the study demonstrates that skill development and employability are closely connected and that stronger links between education, training, and the workplace can improve young people's preparedness for employment.

AI-DRIVEN LEARNING ANALYTICS IN ELEARNING PLATFORMS: ENHANCING STUDENT ENGAGEMENT AND PERSONALIZED LEARNING

Harini. P

Research Scholar, Dr. MGR Educational and Research Institute, Periyar E.V.P High Road, Maduravoyal, Chennai-6000095. Email: harinipalani1306@gmail.com

Abstract

Artificial Intelligence (AI) has transformed the educational sector by introducing intelligent learning systems that enhance student engagement and provide personalized learning experiences. This study examines the role of AI-driven learning analytics in e-learning platforms and its impact on improving student engagement and personalized learning. The study adopts a descriptive research design with a quantitative approach. Primary data were collected from 150 students using a structured questionnaire, while secondary data were obtained from journals, books, and reliable online sources. Simple random sampling was used to select the respondents.The collected data were analyzed using Chi-Square Analysis and Multiple Regression Analysis. The results show that students see AI-driven learning analytics favorably, with the most favored features being AI-based feedback and tailored learning recommendations. The statistical findings show a strong correlation between student engagement and AI-driven learning analytics. Predictive analytics, learning analytics dashboards, adaptive learning, and tailored feedback all have a major impact on student engagement and individualized learning, according to multiple regression analysis. According to the study's findings, AI-driven learning analytics boosts academic performance, improves learning efficacy, facilitates individualized instruction, and produces more captivating online learning environments. In order to ensure data protection, ethical AI practices, and ongoing development of AI-based educational systems, the study advises educational institutions to implement AI-enabled learning tools.

KEYWORDS: *Artificial Intelligence (AI), Learning Analytics, E-learning Platforms, Student Engagement, Personalized Learning.*

INTRODUCTION:

Artificial Intelligence (AI) has emerged as a powerful technology in the field of education, transforming traditional e-learning into intelligent and personalized learning environments.In order to comprehend students' learning behaviors and academic achievement, AI-driven learning analytics collects, analyzes, and interprets learner data utilizing technologies like machine learning, predictive analytics, and data mining. These analytics improve student engagement and learning results by enabling e-learning platforms to offer individualized learning paths, adaptive tests, real-time feedback, and prompt interventions. AI helps teachers make data-driven decisions and provide more effective instruction by determining the strengths, weaknesses, and unique learning needs of each student. AI-driven learning

analytics plays a critical role in improving the quality of e-learning as the use of digital education grows by fostering better academic performance and individualized learning while producing more interactive, effective, and learner-centered educational experiences.

OBJECTIVES OF THE STUDY:

1. To examine the association between AI-driven learning analytics and student engagement in e-learning platforms.
2. To analyze the influence of AI-driven learning analytics factors on student engagement and personalized learning using multiple regression analysis.
3. To identify the key AI-driven learning analytics factors that significantly contribute to enhancing student engagement and personalized learning.
4. To provide suggestions for improving the effectiveness of AI-driven learning analytics in e-learning platforms based on the study findings.

NEED FOR THE STUDY:

1. To understand the role of AI-driven learning analytics in enhancing student engagement and improving learning experiences in e-learning platforms.
2. To assess how well AI-driven tailored learning supports each student's unique learning needs and academic performance.
3. To give educational institutions advice on how to implement AI-enabled learning technology for improved instruction, learning, and decision-making.

REVIEW OF LITERATURE:

Holmes, Bialik, and Fadel (2024) examined the role of Artificial Intelligence in transforming digital education through learning analytics. The study demonstrated how AI-driven analytics efficiently track student learning habits and pinpoint unique learning trends. It was discovered that by offering tailored content and prompt feedback, adaptive learning systems raise student engagement. Predictive analytics, the researchers found, aids in the early identification of at-risk students, allowing for prompt interventions. The significance of ethical AI practices, such as data protection and transparency, was also underlined in the report. The findings showed that AI improves course completion rates, academic achievement, and learner motivation. The authors suggested that in order to enhance learning outcomes, higher education institutions should ethically integrate AI. The study came to the conclusion that developing efficient and customized e-learning environments need AI-driven learning analytics.

Siemens and Baker (2023) investigated the application of learning analytics in modern e-learning platforms. The study discovered that by examining educational data in real time, AI algorithms can properly anticipate learner performance. Student engagement and learning satisfaction were greatly increased by personalized recommendations. The study made clear that educators may use analytics dashboards to track students' development and offer focused assistance. AI-powered interventions improved course completion and decreased dropout rates. The writers talked on how crucial it is to keep AI decision-making transparent and equitable. To guarantee dependable results, they recommended ongoing assessment of AI models. The study came to the conclusion that student achievement and educational quality

are enhanced by AI-driven learning analytics.

Ifenthaler and Schumacher (2022) explored the effectiveness of AI-supported adaptive learning systems in higher education. Personalized feedback improved students' academic performance and learning satisfaction, according to their research. Recommendation systems powered by AI increased student engagement and promoted self-regulated learning. The study showed that learning challenges could be detected using predictive analytics prior to a fall in academic performance. Researchers stressed that good AI predictions depend on high-quality educational data. Learner privacy and ethical data management were shown to be crucial implementation elements. For improved instructional support, the study suggested incorporating AI analytics into learning management systems. The authors came to the conclusion that AI greatly improves individualized learning.

Viberg, Hatakka, Bälter, and Mavroudi (2021) reviewed learning analytics applications in online education. The study discovered that by offering real-time performance data, AI-powered dashboards raised learner engagement. With individualized feedback, students took a more active role in tracking their own learning progress. Teachers were able to identify pupils who needed academic support because to predictive analytics. The study emphasized how adaptive learning pathways enhance knowledge retention. In order to apply AI analytics effectively, researchers stressed the significance of teacher training. Instructional planning and decision-making were improved by data visualization technologies. The study came to the conclusion that student engagement and academic success are greatly enhanced by AI-based learning analytics.

Tsai, Perrotta, and Gašević (2020) investigated how AI technologies affect customized e-learning settings. According to the study, by matching students' skills, adaptive evaluations enhanced learning results. AI recommendation systems increased student motivation by providing personalized learning materials. Because the learning materials matched their learning interests and pace, students were more satisfied. In order to safeguard learner privacy, the researchers stressed responsible AI implementation. Additionally, learning analytics helped teachers enhance their lesson plans and pedagogical approaches. The study emphasized how predictive analytics is becoming increasingly important in digital education. The authors came to the conclusion that AI is essential to improving individualized online education.

RESEARCH METHODOLOGY

The present study adopts a quantitative research approach to examine the impact of AI-driven learning analytics on student engagement and personalized learning in e-learning platforms. The study intends to use AI-enabled e-learning systems to gather, evaluate, and interpret student data. To get complete information, primary and secondary data sources are utilized. While secondary data is gathered from journals, books, research articles, conference proceedings, and reliable web sources, primary data is gathered directly from respondents. The gathered data is analyzed and the study goals are tested using statistical tools.

RESEARCH DESIGN

The study follows a descriptive research design. The present state of AI-driven learning analytics and its impact on student engagement and personalized learning are explained by this design, which makes it suitable. It allows the researcher to examine the beliefs, attitudes, and experiences of respondents without changing any of the variables. Regarding the efficacy of AI-based learning analytics in e-learning systems, the descriptive design offers precise and methodical data.

SAMPLING TECHNIQUE

The Simple Random Sampling Technique is used in this investigation. Every student utilizing an e-learning platform with AI support has an equal probability of being chosen as a response under this strategy. By reducing bias, this sampling method enhances the data's dependability and representativeness. Additionally, it guarantees that the results may be applied to the intended audience.

SAMPLE SIZE

The **sample size** for the study consists of **150 respondents**. The respondents are college and university students who regularly use AI-driven e-learning platforms for academic purposes. A sample of 150 is considered adequate for applying statistical tools such as Percentage Analysis, Chi-Square Test and Multiple Regression Analysis.

SAMPLE UNIT

The **sampling unit** of the study is **individual students** enrolled in higher education institutions who use AI-enabled e-learning platforms. Each student represents one unit of analysis for collecting responses related to engagement, personalized learning, and AI adoption.

TOOLS FOR DATA COLLECTION

The primary tool used for data collection is a structured questionnaire designed using a Five-Point Likert Scale ranging from Strongly Agree to Strongly Disagree. Demographic questions and remarks about AI-driven learning analytics, student engagement, tailored learning, learning satisfaction, and academic performance are included in the questionnaire. Statistical programs like SPSS and Microsoft Excel are used to code and evaluate the gathered responses.

DATA ANALYSIS AND INTERPRETATION

TABLE 1: CHI-SQUARE ANALYSIS BETWEEN AI-DRIVEN LEARNING ANALYTICS AND STUDENT ENGAGEMENT

PARTICULARS	VALUE
CALCULATED CHI-SQUARE VALUE	18.754
DEGREES OF FREEDOM	6
TABLE VALUE (5% LEVEL)	12.592
SIGNIFICANCE LEVEL	0.05
RESULT	SIGNIFICANT

INTERPRETATION:

The calculated Chi-Square value **(**18.754**)** is greater than the table value **(**12.592**)** at the 5% level of significance. Therefore, the null hypothesis is rejected and the alternative hypothesis is accepted. This indicates that there is a significant association between AI-driven learning analytics and student engagement in e-learning platforms. Hence, AI-driven learning analytics plays a significant role in enhancing student engagement.

TABLE 2: MULTIPLE REGRESSION ANALYSIS ON FACTORS INFLUENCING STUDENT ENGAGEMENT AND PERSONALIZED LEARNING

A. MODEL SUMMARY

MODEL	R	R^2	ADJUSTED R^2	STD. ERROR	F	DF1	DF2
1	.786	.618	.605	.418	47.156	5	144

INTERPRETATION:

The multiple regression analysis shows a strong positive relationship between the selected AI-driven learning analytics factors and student engagement and personalized learning **(R = 0.786).** The **R^2 value of 0.618** indicates that **61.8%** of the variation in student engagement and personalized learning is explained by **Adaptive Learning, Personalized Feedback, Predictive Analytics, AI-based Assessment, and Learning Analytics Dashboard.** The **Adjusted R^2 value of 0.605** confirms that the regression model has good explanatory power. The **F-value of 47.156** indicates that the overall regression model is statistically significant.

b. ANOVA

SOURCE	SUM OF SQUARES	DF	MEAN SQUARE	F	SIG.
REGRESSION	52.184	5	10.437	47.156	.000
RESIDUAL	31.876	144	0.221		
TOTAL	**84.060**	**150**			

INTERPRETATION:

The ANOVA results reveal that the **significance value (0.000)** is less than **0.05,** indicating that the regression model is statistically significant. This shows that the selected AI-driven learning analytics factors significantly influence student engagement and personalized learning. Therefore, the regression model is suitable for explaining variations in students' learning outcomes.

C. COEFFICIENTS (UNSTANDARDIZED AND STANDARDIZED)

VARIABLE	B	STD. ERROR	BETA (B)	T	SIG.
(CONSTANT)	0.682	0.201	—	3.393	.001
ADAPTIVE LEARNING (AL)	0.294	0.056	.315	5.250	.000
PERSONALIZED FEEDBACK (PF)	0.228	0.059	.241	3.864	.000
PREDICTIVE ANALYTICS (PA)	0.174	0.061	.181	2.852	.005
AI-BASED ASSESSMENT (AA)	0.091	0.063	.089	1.444	.151
LEARNINGANALYTICS DASHBOARD (LAD)	0.203	0.058	.216	3.500	.001

INTERPRETATION:

The regression results indicate that **Adaptive Learning (t = 5.250), Personalized Feedback (t = 3.864), Predictive Analytics (t = 2.852),** and **Learning Analytics Dashboard (t = 3.500)** have a significant positive influence on student engagement and personalized learning, as their significance values are below **0.05**. However, **AI-based Assessment (t = 1.444)** does not have a significant effect because its significance value **(0.151)** is greater than **0.05.** These findings suggest that adaptive learning, personalized feedback, predictive analytics, and learning analytics dashboards are the key factors enhancing student engagement and personalized learning in AI-driven e-learning platforms.

FINDINGS:

The study found that AI-driven learning analytics has a significant positive impact on student engagement and personalized learning in e-learning platforms. The percentage analysis showed that the majority of students favored AI-based feedback systems and tailored learning recommendations, demonstrating a favorable opinion of AI-enabled learning resources. Students that actively employ AI-based learning features are likely to be more involved in their learning activities, according to the Chi-square research, which demonstrated a substantial relationship between AI-driven learning analytics and student engagement. Additionally, the Multiple Regression Analysis showed that while AI-based Assessment had no discernible impact, Adaptive Learning, individualized Feedback, Predictive Analytics, and Learning Analytics Dashboard had a substantial impact on student engagement and individualized learning. Overall, the results show that AI-driven learning analytics promotes academic achievement, enables individualized instruction, improves learning experiences, and helps create more efficient and learner-centered e-learning environments.

SUGGESTIONS:

Educational institutions should strengthen the adoption of AI-driven learning analytics by integrating adaptive learning tools, personalized feedback systems, and predictive analytics into e-learning platforms. To improve the efficient use of AI technologies, instructors and students should receive regular training. In order to establish an engaging, safe, and customized learning environment that enhances students' academic achievement, institutions must also guarantee data protection, ethical AI practices, and ongoing monitoring of learning outcomes.

CONCLUSION:

Artificial Intelligence has become an essential component of modern e-learning platforms by enabling intelligent learning analytics that support student engagement and personalized learning. According to the study's findings, educational institutions can better analyze student behavior, offer adaptive learning opportunities, and enhance overall academic results by utilizing AI-driven learning analytics. The statistical analyses show that AI-enabled features like learning analytics dashboards, adaptive learning, personalized feedback, and predictive analytics greatly improve student engagement and learning efficacy. The overall impact of AI-driven learning analytics is very beneficial, even though AI-based assessment still has to

be improved. Thus, while guaranteeing the ethical use of educational data and safeguarding learner privacy, educational institutions should keep implementing AI-powered technologies to develop more engaging, personalized, and effective digital learning environments.

THE ROLE OF ARTIFICIAL INTELLIGENCE IN ENGLISH LANGUAGE ASSESSMENT, EVALUATION AND LEARNING ANALYTICS

Dr. Shalini J
Principal, Mythri College of Education, Shivamogga.

Abstract

Artificial intelligence (AI) is rapidly transforming English language education by changing how learners practise language, how teachers evaluate performance, and how educational institutions interpret learning data. In particular, automated assessment, intelligent feedback, natural language processing, speech recognition, generative AI, and learning analytics have created opportunities for more continuous, personalized, and data-informed approaches to English language learning. This paper examines the role of AI across three interconnected domains: English language assessment, evaluation, and learning analytics. It argues that the greatest educational value of AI does not lie in replacing teachers or human raters, but in augmenting professional judgment through timely evidence, individualized feedback, adaptive learning pathways, and longitudinal monitoring of learner development. A conceptual review of recent research is used to identify major applications, benefits, limitations, and ethical considerations. Existing evidence indicates that AI-supported assessment can improve language-learning outcomes, while automated writing feedback can produce meaningful gains in writing performance. At the same time, research on large language models demonstrates continuing concerns concerning validity, reliability, fairness, transparency, linguistic bias, privacy, and the interpretation of higher-order language abilities. Learning analytics adds another dimension by enabling teachers and learners to examine patterns across multiple learning activities rather than relying exclusively on isolated test scores. The paper proposes a human-centred framework in which AI performs data processing, pattern recognition, preliminary evaluation, and personalized feedback, while teachers retain responsibility for interpretation, high-stakes decisions, pedagogical intervention, and ethical oversight. The paper concludes that sustainable AI integration requires assessment literacy, AI literacy, transparent data practices, continuous validation, and meaningful learner participation. AI should therefore be conceptualized not as an autonomous assessor, but as an intelligent partner within an evidence-based English language learning ecosystem.

Keywords: *artificial intelligence, English language assessment, automated evaluation, learning analytics, generative AI, language learning, automated writing evaluation*

Introduction

Artificial intelligence has moved from being an experimental technology to becoming an increasingly visible component of educational practice. In English language education, AI is particularly significant because language learning generates large quantities of textual, auditory, behavioural, and interactional data. Learners produce essays, spoken responses, vocabulary exercises, discussion posts, reading responses, pronunciation attempts, and online learning traces. Traditionally, much of this evidence has been assessed intermittently by teachers through examinations, assignments, classroom observation, and individual feedback. AI creates the possibility of analyzing these forms of evidence continuously and at scale.

The development of natural language processing, machine learning, automated speech recognition, automated writing evaluation (AWE), intelligent tutoring systems, and generative AI has expanded the possible functions of technology in language education. Earlier AI systems were primarily concerned with prediction, classification, correction, and adaptive practice. Contemporary generative AI systems can additionally engage learners in dialogue, generate explanations, provide revision suggestions, construct assessment items, and simulate communicative situations. Consequently, the boundary between learning, assessment, and evaluation is becoming less distinct.

Recent evidence supports cautious optimism. A systematic review and meta-analysis of AI-enabled assessment in language learning identified 25 empirical studies and reported a medium overall effect on language-learning outcomes (Hedges' g = .390), while emphasizing that effectiveness depends on appropriate implementation and instructional design (Chen et al., 2025). Similarly, a meta-analysis of AI interventions in second-language learning found positive effects across language learning outcomes, with particularly promising results for speaking and listening as well as benefits for writing and vocabulary development (Fathi et al., 2024). However, the rapid expansion of AI also creates a fundamental question: What should AI actually do in English language assessment and learning analytics? The answer cannot simply be that AI should grade more assignments faster. Assessment is not merely a technical process of assigning scores. It involves construct definition, interpretation, fairness, consequences, human judgment, and decisions about what counts as meaningful learning. Chuang and Yan (2025), in a systematic review of 77 publications, argue that GenAI introduces both opportunities and substantial challenges for reliability, validity, fairness, and practicality in language assessment. This paper therefore examines AI through three connected functions: assessment, evaluation, and learning analytics. It proposes that the strongest model is a human-centred partnership in which AI increases the availability and usefulness of evidence without becoming the sole authority on learner ability.

Conceptualizing AI in English Language Education

AI in English language education can be understood as a collection of computational techniques that enable systems to recognize patterns, interpret language, generate responses, make predictions, and adapt to users. This includes conventional machine-learning systems, natural language processing, speech technologies, intelligent tutoring systems, AWE platforms, and large language models.

The distinction between assessment and evaluation is important. Assessment refers primarily to the systematic collection of evidence about learner knowledge or performance. Evaluation involves interpreting that evidence to make judgments about quality, progress, achievement, or educational effectiveness. Learning analytics, meanwhile, involves the measurement, collection, analysis, and reporting of data about learners and learning contexts to understand and optimize learning processes.

AI can connect these three functions. For example, a learner submits an English essay. An AI system can identify grammatical patterns, lexical diversity, cohesion, organization, and

possible weaknesses. The system can then provide formative feedback. When similar data are collected over several assignments, learning analytics can identify whether the learner is improving, stagnating, or repeatedly experiencing difficulty. The teacher can use this evidence to modify instruction. Thus, the value of AI emerges not from a single automated score but from the relationship among evidence, interpretation, feedback, and subsequent learning.

This perspective is consistent with research on automated feedback. Fleckenstein et al. (2023) conducted a multilevel meta-analysis involving 20 studies and 2,828 learners and found a medium positive effect of automated feedback on writing performance (g = .55), although substantial heterogeneity indicated that the effectiveness of automated feedback varies according to implementation and context.

AI in English Language Assessment

Automated Writing Evaluation-One of the most established applications of AI in language assessment is automated writing evaluation. AWE systems can examine student writing and provide information about grammar, spelling, vocabulary, syntax, organization, and other textual characteristics. Their major advantage is scalability. A teacher may need several days to provide detailed feedback on hundreds of essays, whereas an automated system can process them almost immediately.

AI-supported writing assessment also enables repeated assessment. Instead of treating writing as a product evaluated at the end of a unit, teachers can use automated feedback during planning, drafting, revision, and reflection. This transforms assessment from a terminal event into an ongoing learning process.

Nevertheless, writing quality cannot be reduced to surface-level correctness. Strong academic writing involves argumentation, rhetorical awareness, evidence use, coherence, disciplinary conventions, originality, and communicative effectiveness. A model may recognize grammatical accuracy more consistently than it recognizes the strength of an argument. Consequently, AI-generated scores should not automatically be interpreted as complete representations of writing ability.

Research examining large language models in automated essay scoring illustrates this issue. Studies have investigated models such as GPT-3.5 and GPT-4 alongside other large language models and human raters, raising questions about the reliability and validity of LLM-based scoring for English-language learners (Computers and Education: Artificial Intelligence, 2024). The implication is not that AI scoring is useless; rather, it should be validated against clearly defined assessment constructs and human judgments before being used for consequential decisions.

Speaking and Listening Assessment-AI also has important applications in oral language assessment. Automatic speech recognition can transcribe learner speech and provide information about pronunciation, fluency, pauses, vocabulary, and grammatical patterns. Conversational AI can create opportunities for learners to engage in simulated communicative interactions without requiring a teacher or peer to be available at every moment.

Such technologies can increase practice opportunities. A learner who is reluctant to speak publicly may be willing to practice repeatedly with an AI conversational partner. AI can also provide immediate feedback, allowing learners to notice recurring errors.

However, speech technologies may perform differently across accents, dialects, proficiency levels, age groups, and linguistic backgrounds. This is especially important in English, which has enormous phonological diversity. If a speech-recognition system performs better with some varieties of English than others, its output could introduce systematic inequality into assessment. Research on automated speech recognition has consequently emphasized the importance of examining linguistic background and task type when using speech technology for language assessment (Chen et al., 2025). The appropriate role of AI is therefore to provide additional evidence about oral performance rather than to define English proficiency according to a single technological model of "correct" speech.

Generative AI and Assessment Design-Generative AI extends assessment possibilities beyond automated scoring. It can generate reading passages, questions, prompts, rubrics, examples, and individualized practice tasks. It can also transform assessment into dialogue. Instead of answering one static question, learners may interact with an AI system that asks follow-up questions and adapts difficulty according to their responses.

This flexibility has significant pedagogical potential. Assessment can become more responsive and diagnostic. Yet generative AI also creates a paradox: the same technology that can assist learning can complete some assessment tasks on behalf of the learner. This makes traditional take-home essays increasingly difficult to interpret as direct evidence of individual writing ability.

Therefore, assessment design must evolve. Teachers may need to emphasize process evidence, oral explanations, drafts, revision histories, reflective commentaries, classroom performance, and authentic tasks. In other words, the response to generative AI should not simply be greater surveillance; it should be better assessment design.

AI in English Language Evaluation- Evaluation involves making educational judgments from assessment evidence. AI can assist this process in several ways.

First, AI can identify patterns that may be difficult for individual teachers to notice. A teacher reviewing one essay may notice grammar errors, but analytics across 500 essays could reveal that a particular cohort consistently struggles with article use, academic vocabulary, or paragraph organization. Such evidence can inform curriculum planning.

Second, AI can support comparative and longitudinal evaluation. Instead of asking whether a learner achieved 72% on one examination, educators can examine development across multiple tasks. A learner might show modest overall score growth while demonstrating substantial improvement in lexical variety and fluency but continued difficulty with argument structure. Such multidimensional evaluation is pedagogically more useful than a single grade.

Third, AI can support moderation. Human raters sometimes differ in their interpretation of rubrics. AI can flag unusual scoring patterns or identify responses requiring a second review. In this role, AI becomes a quality-assurance mechanism rather than an autonomous judge.

This distinction is essential because human evaluation is itself imperfect. Human raters may be influenced by fatigue, expectations, writing style, accent, or other irrelevant characteristics. AI may reduce some forms of inconsistency while introducing other forms of bias. Consequently, replacing human judgment with automated judgment does not automatically produce fairness.

Chuang and Yan (2025) emphasize that AI-driven language assessment must continue to address reliability, validity, fairness, security, and practicality rather than assuming that technological sophistication guarantees assessment quality.

AI and Learning Analytics- Learning analytics provides perhaps the most transformative connection between AI and English language learning. Conventional assessment often produces isolated scores. Learning analytics can integrate information from multiple activities, such as quiz performance, writing revisions, vocabulary practice, speaking attempts, reading behaviour, feedback uptake, time on task, and interaction patterns.

AI can identify patterns within these datasets. For example, an analytics system might detect that a learner who performs well on vocabulary tests nevertheless uses a limited lexical range in writing. Another learner might understand grammar rules but demonstrate persistent difficulties during spontaneous speaking. These patterns allow teachers to move from general judgments to targeted intervention.

Learning analytics can also support early identification of learning difficulties. If a learner repeatedly avoids speaking tasks, submits incomplete assignments, or shows declining engagement, an AI system could alert the teacher. The teacher could then determine whether the problem is linguistic, motivational, technological, or personal.

However, prediction should not be confused with explanation. An algorithm may identify that a learner is "at risk," but it cannot necessarily explain why. Teachers therefore remain essential for contextual interpretation.

Research on human-centred learning analytics reinforces this principle. Alfredo et al. (2024) reviewed 108 studies and found that although human control was increasingly recognized, meaningful involvement of end users in system design remained limited. They recommend stronger stakeholder participation, especially by students and teachers, together with attention to safety, reliability, and trustworthiness.

Benefits of AI-Supported English Learning

The integration of AI into English assessment and analytics can generate several educational benefits.

Personalization- AI can adapt feedback and learning materials to individual needs. A learner struggling with articles can receive targeted exercises, while another learner requiring academic vocabulary can receive more advanced lexical tasks. This moves instruction away from a one-size-fits-all model.

Immediate Feedback-Traditional feedback is often delayed. AI can respond within seconds, allowing learners to revise while their cognitive attention remains focused on the task. The meta-analysis by Fleckenstein et al. (2023) provides evidence that automated feedback can

contribute positively to writing development.

Increased Learning Opportunities-AI systems can provide practice outside formal classroom hours. Conversational systems can support speaking practice, while writing assistants can facilitate repeated drafting and revision.

Teacher Support-AI can reduce repetitive workload by organizing data, identifying common errors, generating preliminary feedback, and highlighting learners who may need attention. This creates more time for teachers to focus on explanation, mentoring, interaction, and higher-order pedagogical decisions.

Continuous Assessment- AI allows assessment to become more continuous. Rather than depending exclusively on mid-term and final examinations, teachers can gather evidence throughout the learning process.

A 2024 meta-analysis of English-language learning studies involving 40 empirical studies and 3,290 participants reported positive overall effects of AI on English learning achievement, further supporting the potential of AI when integrated appropriately into learning environments.

Challenges and Ethical Concerns

The educational benefits of AI should not obscure significant risks.

Validity and Reliability-The central assessment question is whether AI measures what it claims to measure. A system that rewards grammatical complexity may disadvantage learners who communicate effectively using simpler language. Similarly, an essay-scoring system may give high scores to structurally polished texts while overlooking weak reasoning.

Assessment validity must therefore precede technological enthusiasm. Every AI-based assessment system requires evidence demonstrating that its outputs are meaningful for the intended construct and population.

Bias and Fairness- AI systems learn from data. If training data disproportionately represent particular varieties of English, cultural contexts, or learner populations, system outputs may reproduce those biases.

Fairness is especially important for multilingual learners. English language education includes learners with different first languages, cultural backgrounds, educational experiences, and linguistic identities. AI systems should be tested across these populations rather than validated only on convenient samples.

Privacy and Data Protection- Learning analytics depends on data, and AI systems can potentially collect extensive information about learner behaviour. Writing samples, speech recordings, interaction histories, and performance profiles may be sensitive educational data.

UNESCO (2023) emphasizes human-centred AI, data protection, equity, inclusion, and meaningful pedagogical validation in educational use of generative AI. Educational institutions should therefore establish clear policies concerning consent, data retention, access, storage, and third-party processing.

Overdependence on AI- A further concern is learner dependency. If students accept every AI correction without understanding it, technology may improve the immediate product without

developing underlying language competence. AI should encourage reflection rather than passive acceptance.

Students need to learn to question AI output: Is the correction appropriate? Does the suggested word express the intended meaning? Is the feedback consistent with the assignment rubric? Such practices transform AI literacy into part of language-learning literacy.

The Problem of the "Black Box"- Many AI systems cannot provide sufficiently transparent explanations for their decisions. This is problematic when scores affect academic progression. If a learner receives a low AI-generated score, the institution should be able to explain how that decision was reached and provide an avenue for human review.

A Human-Centred Framework for AI-Based English Assessment

Based on the reviewed literature, this paper proposes a five-stage human-centred framework.

Stage 1: Evidence collection. AI collects language-performance evidence from writing, speaking, reading, listening, quizzes, and learning activities.

Stage 2: Computational analysis. AI identifies patterns in grammar, vocabulary, fluency, interaction, revision, and learning behaviour.

Stage 3: Formative feedback. The system provides explanations, examples, questions, and suggestions designed to promote learner revision rather than simply supplying answers.

Stage 4: Human interpretation. Teachers examine AI-generated evidence, consider contextual information, and determine appropriate instructional responses.

Stage 5: Reflective decision-making. Learners review their progress, question AI feedback, set goals, and participate in decisions concerning their learning.

The model can be summarized as:

Learner activity → AI analysis → feedback → teacher interpretation → learner reflection → new learning evidence.

This creates a feedback loop rather than a one-directional scoring system. It also preserves human agency. AI processes large amounts of information, but teachers and learners remain responsible for educational meaning.

9. **Implications for English Language Teachers and Institutions**

The emergence of AI requires changes in teacher professional development. English teachers increasingly need both language-assessment literacy and AI literacy. They should understand what an AI system measures, what it does not measure, how errors arise, and how automated feedback should be interpreted.

Institutions should also develop clear assessment policies. Students should know when AI assistance is permitted, how it should be acknowledged, and which assignments are intended to demonstrate independent performance. Rather than attempting to detect every instance of AI use, institutions should redesign assessment so that learning processes become visible.

For high-stakes assessment, human oversight should remain essential. AI can support scoring and moderation, but consequential decisions should involve trained professionals and opportunities for review.

Finally, students should be treated as participants in AI governance. They should understand

what data are collected, how analytics are used, and how automated decisions can be challenged. Human-centred learning analytics requires precisely this balance between computational efficiency and human agency.

Future Research Directions

Future research should move beyond short-term experiments with individual AI tools. Longitudinal studies are needed to determine whether AI-supported feedback produces durable improvements in English proficiency. Research should also compare different learner populations and English varieties.

More attention is required for speaking, listening, interactional competence, pragmatic ability, and higher-order writing. Current research has frequently concentrated on writing because text is relatively easy to process computationally. However, communicative competence extends well beyond written accuracy.

Researchers should also investigate how teachers actually interpret AI-generated analytics. An accurate algorithm may have little educational value if teachers cannot understand or act upon its recommendations.

Finally, AI assessment research should increasingly examine fairness and explainability. Models should be evaluated across linguistic backgrounds, proficiency levels, genres, and task types. The objective should not merely be higher prediction accuracy, but educationally defensible accuracy.

Conclusion

AI is reshaping English language assessment, evaluation, and learning analytics by making it possible to collect, interpret, and respond to learner evidence at unprecedented speed and scale. Automated writing evaluation can provide immediate formative feedback; speech technologies can expand opportunities for oral assessment and practice; generative AI can create interactive assessment environments; and learning analytics can connect individual performance with longitudinal patterns of development.

Nevertheless, AI should not be regarded as a replacement for teachers or human assessment expertise. Its greatest contribution lies in augmentation. AI can process information rapidly, recognize patterns across large datasets, and provide individualized feedback, while teachers contribute contextual knowledge, professional judgment, empathy, pedagogical reasoning, and ethical responsibility.

The central challenge is therefore not whether AI should be used in English language education, but how it should be used responsibly. Validity, reliability, fairness, transparency, privacy, and learner agency must be treated as fundamental design requirements rather than secondary concerns. The emerging evidence suggests that AI can support meaningful improvements in language learning, but its effectiveness depends strongly on instructional context and implementation.

A sustainable future for AI-supported English education should consequently be human-centred. AI should generate evidence, teachers should interpret it, and learners should actively engage with it. When assessment becomes part of a continuous cycle of evidence, feedback,

reflection, and improvement, AI can contribute not merely to faster evaluation but to a richer understanding of how English is learned. The ultimate purpose of educational AI should therefore not be to automate assessment itself, but to make assessment more informative, learning more personalized, and educational decision-making more responsive while preserving the human values at the heart of language education.

GENDER AND EDUCATION (Thematic Paper)

Prasanna Kumar S
Research Scholar, Karnatak University, Dharwad
Email: prasannakumarsaparegm@gmail.com

Abstract

Gender plays an important role in shaping educational opportunities, experiences, and outcomes. This article examines the relationship between gender and education, with particular attention to gender inequalities in access to education, participation, classroom experiences, and academic achievement. The study explores how social, cultural, economic, and institutional factors influence the educational experiences of girls, boys, and students with diverse gender identities. A review of relevant literature was conducted to identify major patterns and challenges related to gender equality in education. The findings indicate that although significant progress has been made in improving access to education for all genders, inequalities continue to exist in areas such as educational opportunities, subject choices, participation, leadership, and access to resources. Social expectations and gender stereotypes can also influence students' academic choices and future career aspirations. The article highlights the importance of inclusive teaching practices, gender-sensitive policies, equal access to educational resources, and supportive learning environments. Promoting gender equality in education is essential for creating equitable opportunities and enabling all students to achieve their educational and social potential.

Key Words: *Gender, Education, Gender equality Discrimination Stereotype, Co-Science Education, Science, Inclusive education, Education, STEM and vocational education, Samagra Shiksha, Kasturba Gandhi Balika Vidyalayas, NEP 2020.*

Introduction:

Gender and education are closely connected with the social, economic, and cultural development of individuals and society. Gender refers to the roles, behaviours, expectations, and opportunities that society associates with different genders, while education is the process of gaining knowledge, skills, values, and attitudes.

Education plays an important role in promoting gender equality. It provides individuals with equal opportunities to learn, develop their abilities, and participate in social and economic life. However, gender stereotypes and discrimination can influence access to education, choice of subjects, classroom participation, and career opportunities.

A gender-sensitive education system aims to provide equal opportunities, remove stereotypes, prevent discrimination, and create a safe and inclusive learning environment for all students. Thus, education is not only a means of acquiring knowledge but also an important tool for challenging gender inequality and building a more just and equal society.

A review of existing literature shows that education has an important role in reducing gender

inequality: UNESCO (2020) reported major progress in girls' participation in education globally. However, it also emphasised that gender stereotypes continue to influence teachers' attitudes, subject choices, career aspirations, and opportunities later in life. Government of India, NEP 2020 emphasises equitable and inclusive education and recognises gender as a cross-cutting priority. The policy seeks to reduce disparities in access, participation, retention, completion, and learning outcomes. Recent research on NEP 2020 suggests that the policy provides a strong framework for gender equity through measures such as improving girls' enrolment and retention, gender-sensitive curricula, and greater participation of women in educational leadership. However, social norms and economic barriers remain important challenges to implementation. Studies and government reviews also indicate that encouragement, awareness, equal opportunities, and positive role models are important for challenging gender stereotypes among students.

Thus we can conclude that education is both affected by gender inequality and capable of transforming it. Providing equal educational opportunities is not sufficient by itself; schools must also address gender stereotypes in textbooks, classroom practices, subject selection, teacher attitudes, and career guidance. Therefore, gender-sensitive and inclusive education is essential for developing a society based on equality, dignity, freedom, and equal opportunity for all.

Relationship between gender and education

Gender and education are closely related in many societies, influencing educational access, participation, and outcomes.

Gender refers to the socially and culturally constructed roles, behaviors, and expectations associated with being male, female, or other gender identities.

Education is the process of acquiring knowledge, skills, values, and attitudes through teaching, learning, or training.

- Access to education: In some regions, girls and women face barriers such as poverty, early marriage, cultural norms, or discrimination, which can limit their educational opportunities.
- Educational achievement: Gender differences in performance may exist across subjects, but these are often influenced by social, economic, and cultural factors rather than ability.
- Career opportunities: Education helps reduce gender inequality by providing equal opportunities for employment, leadership, and economic independence.
- Empowerment: Educating all genders promotes confidence, informed decision-making, improved health, and greater participation in society.

Importance of gender equality in education

- Ensures equal learning opportunities for everyone.
- Reduces discrimination and stereotypes.
- Promotes economic growth and social development.

- Contributes to achieving the United Nations Sustainable Development Goal 4 (Quality Education) and Goal 5 (Gender Equality).

Importance of Education in Reducing Gender Discrimination

Education plays a very important role in reducing gender discrimination and creating equality between all genders. It helps people understand their rights, challenge stereotypes, and develop attitudes based on equality and respect.

Major importance

1. Creates awareness of equality: Education teaches students that boys, girls, and people of different gender identities deserve equal rights, opportunities, and respect.
2. Breaks gender stereotypes: Education can challenge beliefs such as "boys are better at science" or "girls should only do household work." It encourages children to choose subjects and careers according to their interests and abilities.
3. Provides equal opportunities: Access to quality education improves opportunities for girls and women in higher education, employment, leadership, and decision-making.
4. Empowers women and girls: Education develops knowledge, confidence, skills, and economic independence, helping women participate actively in family, community, and public life.
5. Changes social attitudes: Educated individuals are more likely to question practices such as child marriage, unequal treatment of girls, and restrictions on women's education and employment.
6. Promotes economic independence: Education provides skills needed for employment and entrepreneurship, reducing economic dependence and vulnerability to discrimination.
7. Develops respect and tolerance: Schools can teach cooperation, empathy, dignity, and respect for people regardless of gender.
8. Encourages participation in leadership: Education enables girls and women to participate in politics, administration, science, business, and other leadership roles.
9. Reduces intergenerational discrimination: Educated parents are more likely to support equal education and opportunities for their children, helping create more gender-equal future generations.

Current Reforms in Education in Relation to Gender Stereotypes

In India, recent education reforms, particularly the National Education Policy (NEP) 2020, aim to reduce gender discrimination and challenge traditional gender stereotypes in education. The policy treats gender equality as an important part of equitable and inclusive education.

Major reforms

1. Gender Inclusion Fund: NEP 2020 proposes a Gender Inclusion Fund (GIF) to support equitable education for girls and transgender students. It can support measures such as sanitation facilities, toilets, transport/bicycles and community-based interventions that reduce barriers to education.

2. Removal of gender stereotypes from textbooks: The policy calls for biases and stereotypes in school curricula and textbooks to be removed. Learning materials are expected to promote respect, equality, empathy, human rights and gender equality.
3. Gender-sensitive teacher education: Teachers, principals, counsellors and administrators are expected to be sensitized to inclusion, equity and the needs of different groups. Teacher training can therefore help educators avoid reinforcing ideas such as “boys are better at mathematics” or “girls should choose caring professions.”
4. Encouraging girls' participation in STEM and vocational education: Current reforms aim to provide students with opportunities based on their aptitude and interests rather than traditional gender roles. Vocational education is being integrated into school education, giving students exposure to a wider range of career choices.
5. Improved facilities and safety for girls: Under Samagra Shiksha, interventions include separate toilets for girls, additional teachers including women teachers, residential facilities in appropriate contexts, and sensitisation programmes to encourage girls' participation.
6. Support for disadvantaged girls: Kasturba Gandhi Balika Vidyalayas (KGBVs) provide residential schooling for girls from disadvantaged communities and have been expanded/upgraded to increase access to quality education.
7. Inclusive education for transgender students: NEP 2020 explicitly includes transgender students within its gender-inclusion approach, seeking to ensure that education is accessible and equitable irrespective of gender identity.
8. Changing social attitudes: Education reforms recognise that gender stereotypes are not created only inside classrooms. Schools and communities are encouraged to address attitudes concerning early marriage, girls' higher education, women's employment and unequal expectations placed on boys and girls.

How Science Education Affects Gender

Science education has an important role in promoting gender equality. It can influence how students understand themselves, their abilities, and the roles that society expects them to play.

Major effects of science education on gender

- Breaks gender stereotypes: Science education challenges beliefs that science, mathematics, engineering, or technology are mainly for boys. It encourages girls to participate confidently in these subjects.
- Promotes equal opportunities: Equal access to science education gives boys and girls the opportunity to develop scientific knowledge and pursue careers in STEM (Science, Technology, Engineering and Mathematics).
- Builds confidence among girls: Practical experiments, projects, and problem-solving activities can improve girls' confidence in their scientific abilities and encourage them to consider scientific careers.

- Provides role models: Learning about women scientists such as Marie Curie, Rosalind Franklin, Janaki Ammal, and Kalpana Chawla helps students understand that scientific achievement is not limited by gender.
- Encourages critical thinking: Science teaches students to question assumptions and examine evidence. This can help them critically examine gender stereotypes and discriminatory practices.
- Improves career opportunities: Science education can open doors to careers in medicine, engineering, research, information technology, biotechnology, environmental science, and many other fields.
- Promotes gender-sensitive thinking: Science education can help students understand that biological differences do not justify social discrimination or unequal opportunities.
- Encourages boys to challenge stereotypes too: Gender equality is not only about encouraging girls in science. Boys can also be encouraged to participate in caring professions, household responsibilities, and subjects traditionally associated with girls.

Thus from the above points we can concluded that, Science education can be a powerful tool for reducing gender stereotypes and discrimination. When schools provide equal opportunities, gender-sensitive teaching, supportive teachers, and diverse scientific role models, students are more likely to choose careers according to their interests and abilities rather than traditional gender expectations.

Advantages and Limitations of Co-Science Education

Co-science education can be understood as teaching science to boys and girls together in the same classroom, with equal opportunities for participation, practical work, and learning. It is closely related to co-educational science education.

Advantages

- Promotes gender equality: Boys and girls get equal opportunities to learn science, conduct experiments, and participate in scientific activities.
- Reduces gender stereotypes: It challenges ideas such as “science is for boys” or “girls are better suited to arts and humanities.”
- Improves cooperation: Working together on experiments and projects develops teamwork, communication, and mutual respect.
- Builds confidence: Equal participation in laboratory work, discussions, and problem-solving can increase students' confidence in their scientific abilities.
- Encourages healthy competition: Boys and girls can motivate each other to improve their performance and develop interest in science.
- Develops social skills: Students learn to communicate and cooperate with people of different genders, preparing them for future workplaces and society.
- Provides equal career awareness: Students can learn about opportunities in medicine, engineering, technology, research, and other STEM fields without restricting choices according to gender.

- Creates diverse learning perspectives: Different experiences and viewpoints can contribute to classroom discussions and scientific problem-solving.

Limitations

- Gender stereotypes may still exist: Even in a mixed classroom, teachers, parents, textbooks, or students may continue to hold traditional beliefs about gender and science.
- Unequal participation: Boys may sometimes dominate laboratory activities, discussions, or the use of equipment, while girls may receive fewer opportunities to participate.
- Teacher bias: Unconscious teacher expectations can influence how much encouragement, attention, or responsibility boys and girls receive.
- Social and cultural barriers: Family traditions and community attitudes may discourage girls from pursuing science, technology, engineering, or mathematics.
- Lack of facilities and resources: Schools without adequate laboratories, equipment, trained teachers, or learning materials may not be able to provide meaningful science education to all students.
- Peer pressure: Students may avoid certain science activities or careers because they fear being judged as behaving differently from traditional gender expectations.
- Different learning needs may be overlooked: Treating boys and girls exactly the same does not always address differences in individual learning needs, confidence, background, or access to resources.

Thus from the above points we can conclude that Co-science education is valuable for promoting gender equality, cooperation, confidence, and scientific thinking. However, simply placing boys and girls in the same science classroom does not automatically eliminate gender discrimination. Gender-sensitive teaching, equal participation, supportive teachers, inclusive textbooks, proper facilities, and encouragement from families and society are also necessary to make co-science education effective.

Conclusion

Thus from the above all points we can conclude that, Education is one of the most powerful tools for eliminating gender discrimination. It not only provides knowledge but also changes attitudes, challenges stereotypes, empowers disadvantaged groups, and promotes equal participation in society. Gender-sensitive and inclusive education can help create a society where opportunities are based on ability and interest rather than gender.

LOW ENROLLMENT OF GIRLS STUDENTS IN GOVERNMENT SECONDARY SCHOOLS

Veena H.B.
Research Scholar, Karnataka State Akkamahadevi Womens University, Vijayapura, mandeepposhala@gmail.com

Abstract

The low enrollment of girls in government secondary schools is a significant educational and social issue, particularly in rural and economically disadvantaged communities. Although various government initiatives have been introduced to promote girls' education, many girls continue to discontinue their studies after primary or upper-primary education. Several factors contribute to this problem, including poverty, early marriage, household responsibilities, lack of transportation, inadequate sanitation facilities, safety concerns, parental attitudes, and limited awareness of the importance of secondary education. The problem is more severe among families with low incomes and in communities where traditional gender roles influence educational decisions. Low enrollment of girls not only limits their individual opportunities but also affects social development, economic participation, and gender equality. This study focuses on identifying the major factors responsible for the low enrollment of girls in government secondary schools and suggests measures to improve their participation and retention. Strengthening school infrastructure, providing financial support, ensuring safe transportation, improving sanitation facilities, creating awareness among parents, and developing a supportive school environment can contribute significantly to increasing girls' enrollment and continuation in secondary education.

Keywords: *Girls' education, Low enrollment, Government secondary schools, Gender inequality, School dropout, Parental attitudes, Poverty, Rural education, Educational access, Secondary education.*

Introduction:

Education is one of the most important instruments for the social, economic, and personal development of an individual. It plays a vital role in improving knowledge, skills, confidence, employment opportunities, and quality of life. The education of girls is particularly important because educated girls and women contribute significantly to the health, education, and economic well-being of their families and communities. Despite considerable progress in promoting universal education, the enrollment and continuation of girls in secondary schools remain a challenge in many parts of India.

Secondary education is a crucial stage because it connects elementary education with higher education and employment opportunities. However, many girls who complete primary or upper-primary education do not continue into secondary school. Government schools, which serve a large proportion of children from economically weaker and rural communities, often experience difficulties in attracting and retaining girls at the secondary level.

There are several reasons for the low enrollment of girls. Economic difficulties are one of the

major factors. Poor families may find it difficult to meet expenses related to uniforms, transportation, books, and other educational needs. In some families, girls are expected to assist with household work, care for younger siblings, or participate in agricultural and other family activities. Consequently, education may be given greater priority to boys than girls.

Social and cultural attitudes also influence girls' education. In some communities, parents may believe that girls do not need higher levels of education because they will eventually marry and move to another household. Early marriage can also interrupt or completely end a girl's education. Concerns about girls' safety while travelling to and from school, particularly when schools are located far from their homes, may further discourage parents from sending their daughters to secondary school.

School-related factors are equally important. The availability of separate and hygienic toilets for girls, drinking water, boundary walls, adequate classrooms, female teachers, and safe transportation can influence girls' attendance and retention. A lack of these facilities may make girls uncomfortable and may contribute to absenteeism and dropout, especially after puberty.

Government programmes and policies have attempted to improve girls' participation in education through scholarships, free textbooks and uniforms, residential facilities, awareness programmes, and other forms of support. However, the effectiveness of these measures depends on proper implementation, community participation, and awareness among parents and students.

Therefore, understanding the reasons behind the low enrollment of girls in government secondary schools is essential for developing effective educational interventions. The issue should not be viewed only as an educational problem but also as a matter of gender equality, social justice, and community development. Improving girls' access to and continuation in secondary education can help create a more educated, skilled, and equitable society.

Major Causes of Low Enrollment of Girls in Government Secondary Schools

The major factors responsible for low enrollment of girls include:

- Poverty: Families with limited financial resources may prioritize boys' education.
- Household responsibilities: Girls may be expected to perform domestic work and care for younger children.
- Early marriage: Marriage at a young age often leads to discontinuation of education.
- Distance from school: Long distances and lack of affordable transportation can discourage enrollment.
- Safety concerns: Parents may be reluctant to send girls to schools located far from home.
- Inadequate sanitation: Lack of clean, separate toilets and menstrual hygiene facilities can affect attendance.
- Traditional attitudes: Some families consider girls' education less important than boys' education.

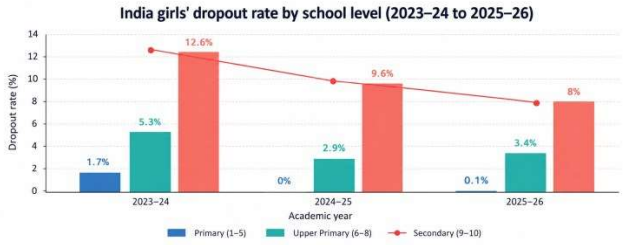
- Lack of awareness: Parents may not fully understand the long-term benefits of secondary education for girls.
- Shortage of female teachers: The absence of female teachers may make some girls and parents less comfortable.
- Academic difficulties: Poor learning outcomes and lack of academic support can cause girls to lose interest in schooling.

Girls barely drop out schools in early years: Government data

- Girls' dropout rates at the secondary level (Classes 9–10) remain the highest across school stages, though they have fallen from 12.6% in 2023–24 to 8% in 2025–26. State-level disparities persist, with Ladakh (15.6%) recording the highest dropout rate, followed by Assam and Karnataka (13.9% each).
- Eight out of every 100 girls enrolled in secondary school dropped out before completing their education in 2025–26. That is the key take away from the Education Ministry's reply in the Lok Sabha this week. While the secondary school dropout rate for girls fell to 8 per cent — the lowest in the past three years, down from 12.6 per cent in 2023–24 and 9.6 per cent in 2024–25 — it remains starkly higher than at the primary level. Even at its lowest, the secondary school dropout rate for girls is nearly 80 times higher than the primary school dropout rate.
- The numbers come from UDISE+, the government's own school database, and were tabled by Minister of State Jayant Chaudhary in response to a question from MP Gurmeet Singh Meet Hayer. The reply breaks dropout rates into three stages: primary, upper primary, and secondary.
- The pattern across almost every state is the same. Girls barely drop out in the early years; some slippage begins around classes 6 to 8, and then a much bigger share vanishes by class 9 or 10, right around the age when most reach puberty, and families start weighing school against work, marriage, or money.
- Union Education Ministry's data shows 8% girl-students in the country have dropped out between class 9 to 10 (AI Image)
- Make us preferred source on Google
- Eight out of every 100 girls enrolled in secondary school dropped out before completing their education in 2025–26. That is the key take away from the Education Ministry's reply in the Lok Sabha this week. While the secondary school dropout rate for girls fell to 8 per cent — the lowest in the past three years, down from 12.6 per cent in 2023–24 and 9.6 per cent in 2024–25 — it remains starkly higher than at the primary level. Even at its lowest, the secondary school dropout rate for girls is nearly 80 times higher than the primary school dropout rate.
- The numbers come from UDISE+, the government's own school database, and were tabled by Minister of State Jayant Chaudhary in response to a question from MP Gurmeet Singh Meet Hayer. The reply breaks dropout rates into three stages: primary, upper primary, and secondary.

- The pattern across almost every state is the same. Girls barely drop out in the early years; some slippage begins around classes 6 to 8, and then a much bigger share vanishes by class 9 or 10, right around the age when most reach puberty, and families start weighing school against work, marriage, or money.

- Nationally, primary dropout among girls is close to zero, at just 0.1 per cent. Upper primary sits at 3.4 per cent. Secondary jumps to 8 per cent. The Centre's own explanation, drawn from the 2023-24 Periodic Labour Force Survey, lists the reasons in plain terms: girls leave to supplement household income, to attend to domestic chores, or because their parents simply do not see further education as necessary.
- **What do state-specific numbers say?**
- State-wise, the secondary-level numbers throw up some surprises. These are not necessarily the poorest states on paper, which suggests the drivers here go beyond income alone and could include distance to secondary schools, safety concerns, or early marriage.



Effects of Low Enrollment

- Low enrollment of girls can have long-term consequences, such as:
- Increased gender inequality.
- Lower employment and income opportunities for women.
- Greater likelihood of early marriage.
- Reduced awareness of health and family welfare.
- Lower participation of women in social and economic activities.
- Intergenerational disadvantages, as mothers' education strongly influences children's educational outcomes.
- Reduced overall development of rural and disadvantaged communities.

Measures to Improve Girls' Enrollment

The following measures can help increase girls' participation in government secondary schools:

- Provide scholarships and financial assistance to girls from economically weaker families.
- Ensure free textbooks, uniforms, and other essential educational materials.
- Improve school sanitation and menstrual hygiene facilities.
- Provide safe and affordable transportation or hostels where necessary.
- Strengthen school safety through appropriate infrastructure and supervision.
- Increase the recruitment and availability of female teachers.
- Conduct awareness programmes for parents and communities regarding the benefits of girls' education.
- Provide academic counseling and remedial support to girls who experience learning difficulties.
- Prevent early marriage through community awareness and effective implementation of relevant laws.
- Encourage local communities, teachers, parents, and government authorities to work together to improve girls' enrollment and retention.

Conclusion

Low enrollment of girls in government secondary schools is a complex issue influenced by economic, social, cultural, family, and school-related factors. Increasing enrollment requires more than providing access to schools. Girls need a safe, supportive, affordable, and inclusive educational environment. Coordinated efforts by government agencies, schools, teachers, parents, and communities can help reduce barriers and ensure that girls have equal opportunities to complete secondary education. Improving girls' education is an investment not only in individual girls but also in families, communities, and the future development of society.

EDUCATION COLLEGE LIBRARIES IN THE STATE OF KARNATAKA

Asha J R
Research Scholar, Karnataka State Akkamahadevi Womens University, Vijayapura, ashaaushakumar@gmail.com
P G Tadasad
Senior Professor, Department of Library and Information Science, Karnataka State Akkamahadevi Womens University, Vijayapura, pgtadasad@gmail.com

Abstract

College libraries are an essential component of higher education because they support teaching, learning, self-study, research, and the overall academic development of students and teachers. In Karnataka, college libraries operate within a diverse higher-education system comprising government, aided, private, autonomous, constituent, and affiliated colleges. The library system has gradually moved from conventional print-based collections toward automated and digital information services. The Department of Collegiate Education (DCE), Government of Karnataka, has also developed initiatives to improve access to electronic resources and library services. The present paper provides an overview of education college libraries in Karnataka, with particular emphasis on their objectives, collections, infrastructure, staffing, automation, electronic resources, services, funding, user facilities, quality assessment, challenges, and future prospects. Karnataka has a large and diverse higher-education sector; the Annual Status of Higher Education report, for example, identifies 157 colleges specializing in education/teacher education in its state-level college data. Studies of Government First Grade College libraries have reported both progress in ICT and automation and continuing problems related to staff, space, grants, collections, furniture, and equipment. Recent research on B.Ed. college libraries in Karnataka also indicates increasing use of electronic resources and services such as OPAC, online databases, bibliographic services, and online reference services.

Keywords : *College libraries; Education college libraries; Karnataka; B.Ed. college libraries; Academic libraries; Digital libraries; Library automation; ICT; Electronic resources; Information services; Higher education.*

Introduction

Libraries are often described as the heart of an educational institution because they provide the information resources required for effective teaching and learning. In colleges of education, the role of the library is particularly important because students are being prepared to become teachers, educational administrators, researchers, and other education professionals. A well-developed education college library therefore needs to provide not only textbooks but also reference books, educational journals, research literature, government publications, electronic resources, teaching-learning materials, and digital information

services. Karnataka has one of India's significant higher-education systems. Its colleges are administered through different institutional and regulatory arrangements, including universities, the Department of Collegiate Education, the University Grants Commission (UGC), and accreditation mechanisms such as the National Assessment and Accreditation Council (NAAC). The Karnataka State Higher Education Council also plays a role in higher-education planning and policy. The development of college libraries in Karnataka has been influenced considerably by information and communication technology (ICT). Traditional libraries that depended primarily on printed books and manual circulation systems are increasingly adopting library-management software, Online Public Access Catalogues (OPAC), digital repositories, Internet facilities, online databases, and remote access. A 2024 study of Government First Grade College library websites in Karnataka found that many libraries were providing information about their collections, rules, objectives, and electronic resources through their websites.

Education College Libraries in Karnataka

An education college library is an academic library attached to an institution that offers teacher-education and related programmes such as B.Ed., M.Ed., and other education-oriented courses. Its primary purpose is to support the curriculum and academic requirements of student-teachers, teacher educators, researchers, and other members of the institution.

Education college libraries in Karnataka may be found in:

1. Government colleges of education
2. Government-aided colleges of education
3. Private unaided colleges of education
4. Autonomous institutions
5. University departments and constituent colleges
6. Institutions offering B.Ed. and M.Ed. programmes
7. Institutions offering integrated teacher-education programmes

The Annual Status of Higher Education report provides an indication of the size of the sector: its Karnataka data lists 157 colleges under Education/Teacher Education among the colleges classified by specialization.

Objectives of Education College Libraries

The major objectives of education college libraries are:

1. To support the teaching and learning programmes of the college.
2. To provide current and relevant educational literature to student-teachers.
3. To develop students' reading and self-learning habits.
4. To provide textbooks, reference books, journals, periodicals, and electronic resources.
5. To support faculty members in teaching and research.
6. To provide access to educational research and scholarly publications.
7. To develop information-literacy skills among students.
8. To support preparation for examinations, assignments, seminars, and projects.
9. To provide digital and Internet-based information services.

10. To preserve important educational and institutional documents.
11. To encourage lifelong learning and independent study.
12. To support innovation in teacher education.

Library Collection

Major types of resources include:

- Textbooks on education
- Reference books
- Encyclopaedias
- Dictionaries
- Educational psychology literature
- Philosophy of education
- Sociology of education
- Educational technology
- Curriculum and pedagogy
- Measurement and evaluation
- Guidance and counselling
- Teacher education
- Inclusive education
- Special education
- Educational administration
- Research methodology
- Children's literature
- School-level textbooks
- Competitive-examination materials
- National and international journals
- Newspapers and magazines
- Government publications
- Dissertations and theses
- Question papers
- E-books
- E-journals
- Online databases

Institutional publications

The Karnataka College Library Manual emphasizes that library requirements differ according to the level and type of education and that undergraduate and postgraduate libraries need collections and services appropriate to their academic programmes.

Library Infrastructure

A separate library building or adequate library space

- Reading room

- Stack area
- Librarian's office
- Technical-processing area
- Reference section
- Periodical section
- Digital library/e-resource area
- Internet-enabled computers
- Printing and scanning facilities
- Adequate lighting and ventilation
- Appropriate furniture
- Accessibility facilities for users with disabilities

Library Staff

A qualified librarian is central to the effective functioning of a college library. Depending on the size and nature of the institution, library personnel may include:

- Librarian
- Assistant librarian
- Library assistant
- Library attendant/support staff
- Technical staff
- ICT/digital-library support staff

The librarian's responsibilities include collection development, classification, cataloguing, circulation, reference service, user education, database management, preservation, library automation, and administration.

One of the important challenges identified in studies of Karnataka's Government First Grade College libraries is inadequate support staff.

Library Automation

Library automation has transformed the functioning of college libraries. Computerized systems reduce manual work and improve the speed and accuracy of library services.

Important automated functions include:

- Acquisition
- Cataloguing
- Classification
- Circulation
- Membership management
- Serial control
- OPAC
- Reports and statistics
- Barcode/RFID-based transactions

Digital-resource management

For example, the University College of Science, Tumakuru, reports automated circulation through integrated library-management software and provides OPAC and web-OPAC services.

Recent research on Karnataka B.Ed. college libraries reported that 91.7% of the surveyed libraries had computerized their libraries using digital software.

Electronic and Digital Resources

The growth of ICT has changed the information needs of education students. Modern college libraries increasingly provide access to:

- E-books
- E-journals
- Online databases
- Digital repositories
- E-ShodhSindhu resources
- N-LIST
- Institutional repositories
- Open-access resources
- Online educational videos
- Government information portals

Web-based reference resources

The Department of Collegiate Education's College Library and Information Resource Service Portal was developed to facilitate access to open-access electronic resources for college libraries in Karnataka.

A recent study of B.Ed. college libraries in Karnataka found that 98.6% of the surveyed libraries provided access to online databases and bibliographic services, while 93.1% provided OPAC facilities.

Library Services

Education college libraries provide a variety of services to meet the information requirements of students and faculty.

Major services include:

- Circulation/loan service
- Reference service
- Current-awareness service
- Selective Dissemination of Information (SDI)
- Current Awareness Service (CAS)
- Bibliographic service
- Referral service
- Indexing and abstracting
- OPAC

- Internet service
- E-resource access
- Online reference service
- Reprographic service
- Newspaper clipping service
- User orientation
- Information-literacy programmes
- Digital-library services
- Remote access to electronic resources

Research on NAAC-accredited B.Ed. college libraries in Karnataka reported reference service in all 72 surveyed libraries, while 98.6% offered online databases and bibliographic services. The same study found that 61% of the surveyed libraries provided online reference services, indicating the growing importance of virtual information assistance.

Role of ICT in Education College Libraries

ICT has changed the role of the librarian from a custodian of printed books to an information professional who helps users identify, evaluate, access, and use information.

ICT facilitates:

- Faster information retrieval
- Automated circulation
- Online catalogues
- Electronic databases
- Digital collections
- Remote access
- Online reference services
- Institutional repositories
- Communication with users
- Digital literacy

Problems and Challenges

Despite considerable progress, education college libraries in Karnataka face several challenges.

Inadequate funding

Insufficient financial resources can restrict the purchase of current books, journals, electronic databases, software, and equipment.

Shortage of staff

Some college libraries do not have adequate professional and support staff. This affects cataloguing, circulation, reference services, digital services, and user education.

Inadequate infrastructure

Limited space, outdated furniture, insufficient computers, and inadequate digital infrastructure can reduce the effectiveness of library services.

Unequal development

Government, aided, and private colleges may have substantially different levels of library infrastructure and resources.

Rapid technological change

Libraries need continuous investment in hardware, software, networking, cybersecurity, digital resources, and staff training.

Low utilization

The availability of resources does not automatically ensure their effective use. Students require orientation and information-literacy training.

Preservation of print materials

Older books and educational documents require proper preservation, conservation, and digitization.

Lack of awareness of e-resources

Students may not know how to search databases, evaluate online information, use scholarly sources, or access open educational resources.

Website and digital presence

Although many colleges are developing library websites, the quality and quantity of information available online varies among institutions.

Recent Developments

College libraries in Karnataka are increasingly moving toward a hybrid library model, combining print collections with electronic information resources.

Recent developments include:

- Library automation
- Web OPAC
- Digital libraries
- Online databases
- E-journals and e-books
- Institutional websites
- Online reference services
- Digital repositories
- Remote information access
- Computerized circulation
- User-oriented services
- Information-literacy programmes

A 2025 study specifically examining NAAC-accredited B.Ed. College libraries affiliated with Rani Channamma University reported substantial adoption of ICT-based library services and a shift from predominantly print resources toward electronic information resources.

Suggestions for Improvement

The following measures can strengthen education college libraries in Karnataka:

1. Increase library funding to ensure continuous development of collections and infrastructure.
2. Recruit adequate professional and support staff according to institutional requirements.
3. Modernize library infrastructure with comfortable reading areas and accessible facilities.
4. Expand e-resource subscriptions and promote legitimate open-access resources.
5. Provide regular ICT training for librarians.
6. Conduct information-literacy programmes for student-teachers.
7. Strengthen library websites with OPAC, e-resources, services, rules, and contact information.
8. Develop institutional repositories for theses, dissertations, projects, and institutional publications.
9. Promote resource sharing among colleges and universities.
10. Use library usage statistics to understand user needs and improve services.
11. Digitize valuable and frequently used resources where copyright and licensing permit.
12. Introduce mobile-friendly library services where technically feasible.
13. Improve accessibility for students with disabilities.
14. Regularly evaluate user satisfaction through surveys and feedback.
15. Integrate library instruction with teacher-education programmes.

Future Prospects

The future of education college libraries in Karnataka is likely to be increasingly digital, networked, and user-centered. Artificial intelligence, discovery systems, digital repositories, mobile access, remote services, open educational resources, and data-driven library management may become increasingly important.

However, digital transformation should not mean abandoning print resources. Education students continue to need textbooks, reference materials, journals, teaching aids, and other physical resources. Therefore, the most appropriate model for many colleges will be a hybrid library, combining high-quality physical collections with reliable digital information services.

The future success of college libraries will depend on three major factors: adequate resources, competent library professionals, and effective use of technology.

Conclusion

Education college libraries are indispensable to the development of quality teacher education in Karnataka. They support students, teacher educators, researchers, and the academic programmes of institutions by providing access to relevant information resources and services.

The college-library environment in Karnataka has progressed from conventional print-oriented operations toward automated and digitally supported services. OPACs, electronic databases, online reference services, digital resources, and library websites are increasingly

becoming part of the academic-library environment. Evidence from recent studies indicates significant ICT adoption in Karnataka's college libraries, particularly among NAAC-accredited B.Ed. institutions.

Nevertheless, challenges involving funding, staffing, infrastructure, collection development, ICT facilities, and unequal institutional development remain.

Strengthening these areas will enable education college libraries to provide more effective support for teaching, learning, research, professional development, and lifelong learning.

Thus, the development of strong and technology-enabled education college libraries should be regarded as an important component of improving the quality of teacher education and higher education in Karnataka.

BENEFITS, ETHICAL CHALLENGES AND ITS IMPACT OF 'ARTIFICIAL INTELLIGENCE IN SOCIAL WORK'

Kumaraswamy S.S.
M.A., M.S.W., M.S., M.Phil. K-SET Lecturer, Department of Social Work Kuvempu University Sahyadri Arts College, Vidyanagar Shimoga-577203, Karnataka, India
Email: kumaraswamy.2480@gmail.com

Abstract

This research paper will look at the potential of artificial learning in the field of social work as a helping profession, focused on benefits, ethical challenges and it impacts of artificial intelligence in social work, artificial intelligence represents a complex area that is still not advanced enough. Especially in the field of social work, in this sense artificial intelligence is seen as a discipline and science that should make everyday life easier while on the other hand, there are still numerous moral and ethical issues, Especially in the social work field, however the paper explores and will focus on the strength and the common tendencies of the aforementioned disciplines. Additionally the paper will present what the main ethical dilemmas and challenges in its implementation of artificial intelligence in the field of social work.

Keywords: Artificial Intelligence Social Work Ethical Dilemmas Numerous Moral and Ethical Challenges

Artificial intelligence (AI) is a technology that enables computers and machines to stimulate human learning comprehension, problem solving, decision making, creative and autonomy, applications and devices equipped with the artificial intelligence can be seen and identify objects that can understand as well respond to human language, they can take and learn from new information and experience, they can make the detailed recommendations to users and experts that can act independently replacing the need for human intelligence or intervention. The use of artificial intelligence in the social work profession is an emerging area of practice, artificial intelligence promises to revolutionize the way we work by using computer systems to perform tasks and typically require human intelligence such as learning from experience reasoning problem solving and understanding natural language

Growing importance in social work

Social work is a field that is dedicated to improving the well-being and quality of life of individuals, families and communities. it is focused on helping people to overcome their social problems and challenges with the rise of artificial intelligence in recent years. There has been a growing interest in how technology can be used to address social challenges, in the recent years the field of clinical social work, human resource management, research community development planning and organisation, policy

implementation etc., have begun exploring the integration of artificial intelligence to enhance service delivering and outcomes so well based on all these concepts in connection with social work this research paper will going to take its emphasis to know the comprehensive understanding of how Artificial intelligence technologies can revolutionize in the field of social work profession. Therefore artificial intelligence tools are offering promising advancements in the field of social work, while the present range of benefits such as enhancing and streamlining management. It is crucial to approach their integration with caution as well especially considering the ethical concerns and importance of maintaining social development in it.

Objectives and application of Artificial Intelligence in social work

a) Streaming administration automating documentation: transcribing case notes and writing Reports to reduce burnt out and save working hours. b) Enhancing predictive and analytics:

Using data patterns to identify vulnerable group's early and deploying timely interventions for Issues like home sickness are abuses. c) Optimising resource allocation:

Assistant organisations through the association allied social work professionals are similar Groups to match community needs with available aids d) Support decision making:

Analysing case details and summarizing complex resources to help practitioners evaluate risks more.

e) Enhancing efficiency and reducing administrative burden:

1) Streamlining paper work and report generation

2) Reducing cognitive load and retrieval overheads

3) Improving consistency and quality of case recordings.

f) Supporting evidence based on data drivers decision making:

1) Predictive analytics for early identification of things at risk individuals are families.
2) Risk assessment is triage prioritization.
3) Forecasting intervention outcomes to tailor strategies per client. g) Improving accessibility inclusivity and equity

1) Powering a chat boots and virtual assistance for 24 into 7 information and support

2) Enabling language translation speech to text and sentiment analysis for driver's communication needs

3) Detecting and mitigating biases in services allocation through data driven audits. h) Advancing in prevention and early intervention:

1) Flagging emerging risks example suicidal City domestic violence neglect before escalation

2) Identifying community level friends to guide resource deployment and policy
3) Optimising resource allocation to high need cases and regions.
i) Strengthening professional capacity and education
1) Stimulated case scenario and adaptive learning platforms.
2) Real time feedback on case notes are intervention plans.
3) Tools for reflective practice and Bond on protection.

Benefits of artificial learning in social work

Artificial intelligence offers range of potential benefits for social work from improving efficiency to supporting better outcomes for service users when used thoughtfully AI can help practitioners manage their workload, enhance communication and make more inform decisions, yet AI also brings significant challenges and ethical considerations that professionals should understand before using Artificial Intelligent tools to ensure these are deployed in a manner, consistent with professional values, this explores the benefits and potential pitfalls of artificial intelligence as well strategies to consider for Artificial Intelligent use in practice. Specially, generative artificial tools can help social workers with administrative tasks allowing them to have more time for direct practice services for example chat GPT can create and generate client notes create psycho education materials and develop treatment plan goals there also AI behaviour health chart bots like wombat that can stimulate therapeutic conversions and ways in an artificial intelligence chat bot, service that uses evidence based cognitive behaviour techniques, to assist people predictive artificial intelligence analytic known as data forecasting can also be used to enhance decision making and service delivery.

Conclusion: Social work education and training programs will need to evolve to include teaching artificial intelligence. Literacy to make sure that future social workers are equipped to use these technologies effectively. Additionally inter disciplinary collaboration between social workers and technologist will be essential in developing AI tools for social workers that ensure ethical practice. Overall the integration of Artificial Intelligence in social work presents opportunities risks and ethical considerations, while artificial intelligence has the potential to enhance social work services and save time for administrative tasks. it also raises concerns about bias and ethical implications, its crucial to approach in its integration responsibility and ethically. Artificial intelligence should not replace the human aspect of social work practice; instead our professional should still promote and practice interpersonal interaction genuine communication and empathy.

A STUDY OF ENGLISH SPELLING DIFFICULTIES AMONG VII GRADE STUDENTS STUDYING IN KANNADA-MEDIUM SCHOOLS IN DAVANGERE CITY

Dr. Santhosh Kumar R
Assistant Professor, M M College of Education Anubhavamantapa campus, Davangere Karnataka State

Abstract

W*riting is an essential language skill that enables students to communicate their ideas clearly and accurately. However, many students experience difficulties in writing, particularly in spelling, which may affect their overall academic performance. The present study focuses on identifying the spelling difficulties in English among VII-grade students studying in Kannada-medium schools. The study aims to identify the nature and extent of spelling difficulties and to examine differences in spelling performance with respect to gender and type of school. A structured questionnaire was used to collect primary data from the selected students. The findings of the study may help teachers identify common spelling difficulties and develop appropriate teaching and remedial strategies to improve students' spelling skills and written communication.*

Keywords: *Spelling difficulties, Need and Importance of the study, Objectives of the Study, Analysis and interpretation of data, Educational implication*

Introduction:

Language is the primary means of human communication and plays a vital role in expressing thoughts, ideas, and emotions. The development of the four basic language skills—listening, speaking, reading, and writing—is essential for effective communication and academic success. Among these, writing is one of the most complex skills, requiring learners to organize their ideas and use correct spelling to communicate clearly.

Spelling is a fundamental component of writing that ensures accuracy and clarity in written communication. Students with spelling difficulties often struggle to express their ideas effectively, which can negatively affect their writing performance, academic achievement, and self-confidence. Therefore, identifying and addressing spelling difficulties is important for improving students' writing skills. The present study focuses on spelling difficulties among students to understand the nature of these difficulties and to suggest appropriate strategies for enhancing their spelling and writing abilities.

Need and Importance of the Study

The major objective of language teaching is to develop effective communication skills in both spoken and written forms. Correct spelling is an essential component of writing, as it helps students express their ideas clearly, accurately, and meaningfully. However, many students face difficulties in spelling English words, which may affect their writing skills,

academic performance, and confidence in using the language.

Identifying the common spelling difficulties faced by students is important for teachers, as it enables them to understand the specific areas in which learners require support. Awareness of these difficulties helps teachers and teacher educators plan appropriate remedial teaching strategies and provide effective learning opportunities to improve students' spelling abilities.

Although several studies have examined writing errors, comparatively fewer studies have focused specifically on the spelling difficulties experienced by students in Kannada-medium schools. Therefore, the present study is undertaken to identify the spelling difficulties in English among VII-grade students studying in Kannada-medium schools. The findings may help teachers develop suitable instructional and remedial measures to improve students' spelling skills and overall written communication.

Objectives of the Study:

1. To ascertain the writing difficulties of VII grade students in English language in terms of handwriting and spelling.
2. To analyze their difficulties in script handwriting with respect to gender and type of schools.
3. To examine students difficulties in cursive handwriting with respect to their gender and type of schools.

Selection of the Sample:

The sample for the study was selected from Davangere city. Totally four schools were selected from the Davangere city, in which includes two private and two government schools. While selecting the schools, the feasibility to administer the tool and the co-operation from the school administrators keeps in mind.

All together 63 students studying in VII grade private schools and 67 students studying in VII grade government schools. So totally 130 students are selected for the study.

Tool Used:

The investigator used Kottmeyer's diagnostic spelling test developed by William Kottmeyer was used as a reference and modified by the investigator as per the VII standard syllabus.

Analysis of Data

The objective of the study was to identify spelling difficulties experienced by VII grade children; qualitative analysis is used for this purpose. This is done by item analyses in which percentage of difficulty faced by the students in each item are calculated. Based on the percentage, difficulties faced by the students are identified.

Analysis and interpretation of data

The first section deals with the identification of specific writing difficulties with reference to handwriting and spelling. Here the types of errors and percentage of students committed the errors and presented under different subgroups.

Identification of spelling difficulties faced by VII grade children

Item analysis in terms of percentage in spellings

Word	Element tested	Total	Private school			Government school		
			Total	Boys	Girls	Total	Boys	Girls
Howling	'ow' spelling of 'ou' sound, ing ending	66.31	71.43	57.7	81.09	61.2	51.29	75.00
Breath	'th' spelling	69.76	61.91	46.16	72.98	77.62	69.24	98.29
Shoot	'sh' spelling, long oo	87.17	95.24	96.16	94.6	79.11	66.7	96.43
Good	Short oo	4.58	3.18	3.85	2.8	5.98	2.57	14.29
White	'wh' spelling vowel consonant	59.92	57.15	53.85	59.46	62.69	53.85	75.00
Permit	P spelling, vowel before	87.59	84.13	76.93	83.79	91.05	87.18	96.43
Eat	t-spelling two vowels together	22.91	17.47	11.54	21.63	28.36	28.21	28.58
Class	Double final consonant as propelling of 'k' sound	35.69	20.64	11.39	24.33	50.75	56.42	42.86
Return	Pre-consonant nasal	70.65	66.67	38.47	86.49	74.63	71.8	78.58
Returns	Additional of 's'	79.33	82.54	73.08	89.19	76.12	71.8	82.15
Returned	Additional of 'ed'	74.57	73.02	61.54	81.09	76.12	74.36	78.58
Returning	Additional of 'ing'	71.39	66.67	50.00	78.38	76.12	74.36	78.58
Dish	Short vowel	29.82	23.81	38.47	13.52	35.83	25.65	50.00
Missing	Double final consonant before 'ing'	61.12	47.62	46.16	48.65	74.63	64.11	89.29
Come		39.9	36.51	57.7	21.63	43.29	38.47	50.00
Coming	Dropping final 'e' before 'ing'	48.65	4.77	92.31	89.19	92.54	89.75	96.43
Puppy		76.01	71.43	69.24	72.98	80.6	74.36	89.29
Puppies	Changing final 'y' to 'i' before ending	92.07	92.07	88.47	94.6	0	0	0
Small		25.39	25.4	26.93	24.33	25.38	17.95	35.72
Cutter	'er' ending	32.24	30.16	38.47	24.33	34.33	30.77	39.29
Smallest	'est' ending	71.68	76.2	69.24	81.09	67.17	58.98	78.58
Hearted	Compound word	82.31	82.54	73.08	89.19	82.09	79.49	85.72
Grand father	Compound word	55.81	44.45	42.31	45.95	67.17	64.11	75.00
Can't	contractions	85.3	82.54	73.08	89.19	88.06	92.31	67.86
Haven't	contractions	86.98	88.89	88.47	89.19	85.08	0	82.15
Sight	Silent	75.14	92.07	88.47	94.6	58.21	66.67	46.43
Bought	Silent	0	0	0	0	10.0	0	0
Humble	'le' ending	81.33	74.61	73.08	75.68	88.06	84.62	92.85
Because	Non-phonemic spelling	69.67	8.74	65.39	54.06	80.6	76.93	85.72
Caught	Non-phonemic spelling	90.71	88.89	88.47	89.16	92.54	97.44	85.72

Finding from the above table

1. The major mistake made by the total sample in writing correct spelling is “Bought”. Here the students were unable to identify the silent sound of “gh”.
2. The second major mistake is unable to write correct spelling of “permit”. They are lack in spelling the vowel before r.
3. The third major mistake is unable to write correct spelling form of Haven’t and can’t. they are lack in contractions
4. The fourth major mistake is unable to write correct spelling of “hearted”. They are lack in writing compound words.
5. Majority made mistake in writing corrects spelling of “shoot” where they unable to recognize the long oo after ‘sh’ spelling.
6. Majority made mistakes in adding‘s’ and ‘ed’ at the last of the word.
7. Majority made mistake while changing “y” to “ies” before ending, for example puppy to puppies.
8. Majority faced difficulty in writing correct spelling of caught which is a non-phonemic spelling.
9. Majority wrote correct spelling of good which is short oo.

Educational implication

The educational implications of the study are

1. Identification and assessment of spelling difficulties will help teachers understand the specific areas in which students face problems in learning and using English spelling. This will enable teachers to adopt appropriate teaching methods, learning activities, and remedial measures according to the individual needs of students.
2. The findings of the study may help teachers identify common causes and patterns of spelling errors among students. Teachers can provide regular guidance, practice, and corrective feedback to help students develop accurate spelling habits.
3. Teachers should be encouraged to use effective and learner-friendly strategies such as phonics, word-building activities, dictation, spelling games, reading activities, and repeated practice to improve students’ spelling skills.
4. Early identification and timely intervention can help prevent persistent spelling problems and improve students’ confidence, writing ability, academic performance, and overall English language skills.

Conclusion

The present study highlights the importance of identifying writing difficulties among VII-grade students studying in Kannada-medium schools, particularly in the areas of handwriting and spelling. Writing is a complex language skill that requires accuracy, clarity, coordination, and effective expression of ideas. The study emphasizes that difficulties in script handwriting, cursive handwriting, and spelling may hinder students’ written communication and academic performance. The findings can help teachers recognize specific areas of difficulty and adopt appropriate instructional and remedial strategies. Regular practice, individualized guidance,

corrective feedback, and suitable handwriting and spelling activities can contribute to improvement. Thus, systematic identification and timely intervention are essential for strengthening students' writing abilities, enhancing their confidence, and promoting effective communication in English.

A STUDY ON PERCEPTIONS OF SCIENCE TEACHERS OF KENDRIYA VIDYALAYA SANGATHAN SCHOOLS OF KARNATAKA TOWARDS PEDAGOGICAL INNOVATIONS AND ARTIFICIAL INTELLIGENCE IN THEIR SUBJECT

Dr. Bharat Kumar P. Kulkarni
Assistant Professor Nutan Vidyalaya Society's College of Education Kalaburagi, Karnatak

Abstract

The rapid development of educational technology and Artificial Intelligence (AI) is transforming the ways in which Science is taught and learned. Pedagogical innovations such as inquiry-based learning, project-based learning, flipped classrooms, collaborative learning, experiential learning, simulation, virtual laboratories and technology-enhanced assessment provide new opportunities for making Science education more meaningful and learner-centred. Artificial Intelligence further expands these possibilities through adaptive learning, intelligent tutoring, automated feedback, content generation, scientific visualization, personalized learning and data-supported instructional decision-making. The present study was undertaken to examine the perceptions of science teachers working in Kendriya Vidyalaya Sangathan (KVS) schools of Karnataka towards pedagogical innovations and the application of Artificial Intelligence in Science teaching. A descriptive survey method was adopted. A sample of 400 Science teachers working in KVS schools of Karnataka was selected through an appropriate sampling procedure. A Perception Scale on Pedagogical Innovations and Artificial Intelligence in Science Teaching was developed and administered. The study examined teachers' perceptions in relation to selected demographic and professional variables. Mean, Standard Deviation, independent-samples t-test and one-way ANOVA were employed for data analysis. The findings indicated that Science teachers generally possessed a favourable perception towards pedagogical innovations and AI applications in Science education. Significant differences were observed with respect to selected professional variables. The findings emphasize the need for continuous professional development, AI literacy, access to digital infrastructure and responsible integration of emerging technologies into Science pedagogy.

Keywords: *Science Teachers, Kendriya Vidyalaya Sangathan, Pedagogical Innovations, Artificial Intelligence, Science Education, AI in Education, Teacher Perception.*

1. Introduction:

Science education plays a fundamental role in developing scientific temper, critical thinking, problem-solving ability, creativity, curiosity and evidence-based reasoning among learners. Traditionally, Science teaching has often depended on classroom explanation, textbook-based instruction, demonstrations and laboratory activities. However, contemporary educational demands require Science teachers to adopt innovative pedagogical approaches that actively engage learners in constructing knowledge.

Pedagogical innovation refers to the introduction and effective use of new or improved teaching-learning approaches, strategies, resources and assessment practices. In Science education, such innovations include inquiry-based learning, discovery learning, project-based

learning, problem-based learning, experiential learning, collaborative learning, flipped learning, STEM/STEAM approaches, simulations, virtual laboratories, augmented and virtual reality, concept mapping and technology-supported formative assessment.

The emergence of Artificial Intelligence has created another significant dimension in Science education. AI can support teachers in generating lesson plans, creating differentiated learning materials, developing questions, analysing student responses, identifying learning difficulties, providing personalized learning experiences and creating simulations and visualizations. Generative AI can also assist in explaining scientific concepts at different levels of complexity and developing classroom activities.

However, the educational use of AI also presents challenges. Science teachers need to consider the accuracy of AI-generated scientific information, student dependence on AI, academic integrity, privacy, bias, copyright and responsible use. Consequently, teachers' perceptions are critical to the successful integration of AI.

Kendriya Vidyalaya Sangathan operates a large network of schools across India and has an important role in providing quality school education. KVS schools emphasize academic excellence, technology integration, activity-based learning and holistic development. Science teachers in KVS schools therefore constitute an important group for studying perceptions towards pedagogical innovations and AI.

The present investigation focuses specifically on Science teachers working in KVS schools of Karnataka and examines their perceptions regarding contemporary pedagogical innovations and the application of AI in their subject.

2. Need and Significance of the Study:

The integration of pedagogical innovations and AI into Science education requires more than the availability of technology. Teachers' perceptions, confidence, pedagogical knowledge and institutional support influence whether innovations are meaningfully incorporated into classroom practice.

The study is significant because:

1) It examines the preparedness of Science teachers for emerging pedagogical innovations.
2) It investigates teachers' perceptions of AI applications in Science teaching.
3) It provides evidence regarding teachers' acceptance of technology-supported pedagogy.
4) It can help KVS administrators design appropriate professional development program.
5) It may support the development of AI-integrated Science teaching strategies.
6) It can help identify barriers to technology adoption.
7) It provides a basis for strengthening teacher education and in-service training.
8) It contributes to the growing Indian literature on AI and Science education.

3. Statement of the Problem:

A Study on Perceptions of Science Teachers of Kendriya Vidyalaya Sangathan Schools of Karnataka Towards Pedagogical Innovations and Artificial Intelligence in Their Subject

4. Objectives of the Study:

The study was conducted with the following objectives:

1) To study the overall perceptions of Science teachers towards pedagogical innovations and AI in Science teaching.
2) To study the level of perceptions of Science teachers towards pedagogical innovations in Science.
3) To study the level of perceptions of Science teachers towards applications of AI in Science teaching.
4) To find out whether there is a significant difference in perceptions of male and female Science teachers towards pedagogical innovations and AI.
5) To find out whether there is a significant difference in perceptions of Science teachers belonging to different locales.
6) To find out whether there is a significant difference in perceptions of Science teachers with different levels of teaching experience.
7) To examine the relationship between perceptions towards pedagogical innovations and perceptions towards AI.
8) To compare the findings of the present study with findings of previous studies concerning technology integration, pedagogical innovation and AI in education.

5. Hypotheses:

The following null hypotheses were formulated:

1) **H01:** There is no significant difference between male and female Science teachers in their perceptions towards pedagogical innovations and AI.
2) **H02:** There is no significant difference between Science teachers from different locales in their perceptions towards pedagogical innovations and AI.
3) **H03:** There is no significant difference among Science teachers with different levels of teaching experience in their perceptions towards pedagogical innovations and AI.
4) **H04:** There is no significant relationship between perceptions towards pedagogical innovations and perceptions towards AI in Science teaching.

6. Operational Definitions:

1) **Pedagogical Innovations:**Pedagogical innovations refer to new or improved approaches, methods, strategies, learning environments, technologies and assessment practices used to enhance Science teaching and student learning.
2) **Artificial Intelligence**: Artificial Intelligence refers to computer-based systems capable of performing tasks involving learning, prediction, reasoning, language processing, pattern recognition, content generation and decision support.
3) **AI in Science Teaching**: AI in Science teaching refers to the use of AI-supported applications for lesson planning, scientific content generation, personalized learning, assessment, feedback, simulations, visualization, problem solving, remedial instruction and learning analytics.

4) **Perception:** Perception refers to the views, beliefs, understanding and evaluative responses of Science teachers regarding the usefulness, feasibility, effectiveness, challenges and responsible use of pedagogical innovations and AI in Science education.

7. Research Method:

The descriptive survey method was adopted for the present study.The method was considered appropriate because the study aimed to examine the existing perceptions of science teachers regarding pedagogical innovations and AI without manipulating any experimental conditions.

7.1. Population of the Study:

The population consisted of science teachers working in Kendriya Vidyalaya Sangathan schools in Karnataka.The study included teachers teaching Science at the secondary and higher-secondary levels.

7.2. Sample:

A sample of **400 Science teachers** was selected from KVS schools representing different geographical areas of Karnataka.

7.3. Tools used:

For the present study, a tool entitled "Perception of Pedagogical Innovations and Artificial Intelligence in Science Teaching Scale (PPI-AIST)" was developed by the investigator to assess the perception of Science teachers towards pedagogical innovations and the application of Artificial Intelligence in Science teaching. The scale consists of statements designed to measure teachers' perceptions regarding contemporary innovative teaching practices and the effective integration of AI-based technologies into Science education. The scale may contain **50 statements** arranged under two major parts. Part A: Pedagogical Innovations includes ten dimensions, namely inquiry-based Science teaching, project-based learning, experiential learning, collaborative learning, problem-based learning, STEM/STEAM pedagogy, flipped learning, virtual laboratory and simulation, scientific visualization, and innovative assessment. Part B: Artificial Intelligence in Science includes ten dimensions, namely AI-assisted lesson planning, AI-generated teaching resources, personalized Science learning, AI-supported assessment, automated feedback, scientific visualization, AI-supported experimentation and simulation, identification of learning difficulties, remedial and enrichment instruction, and ethical and responsible use of AI. The statements are presented in a five-point Likert-type format, consisting of Strongly Agree, Agree, Undecided, Disagree and Strongly Disagree. Before the final administration of the tool, appropriate procedures should be followed to establish its content validity, construct validity and reliability, and a pilot study should be conducted to examine the clarity, suitability and consistency of the statements. For a final research or journal manuscript, the actual number of retained items, validity coefficients, reliability coefficient and pilot-study findings should be reported based on the investigator's empirical data.

7.4. Scoring Procedure:

Each statement of the PPI-AIST was scored on a five-point scale. For positively worded statements, Strongly Agree was assigned a score of 5, Agree 4, Undecided 3, Disagree 2 and

Strongly Disagree 1. For negatively worded statements, reverse scoring was adopted, wherein Strongly Agree was scored 1, Agree 2, Undecided 3, Disagree 4 and Strongly Disagree 5. The scores obtained for all the statements were summed to obtain the total score of each respondent. A higher total score indicates a more favourable perception towards pedagogical innovations and the use of Artificial Intelligence in Science teaching, whereas a lower score indicates a comparatively less favourable perception. The scoring procedure enables the investigator to quantify and compare the perceptions of Science teachers regarding contemporary pedagogical innovations and AI-supported Science teaching practices.

7.5. Statistical Techniques:

The data collected through the Perception of Pedagogical Innovations and Artificial Intelligence in Science Teaching Scale (PPI-AIST) were systematically coded, tabulated and analysed using appropriate statistical techniques. Mean and Standard Deviation were used to determine the central tendency and variability of the scores obtained by the respondents. An independent-samples t-test was employed to examine whether there were significant differences between the mean scores of two independent groups with respect to the selected demographic variables. One-way Analysis of Variance (ANOVA) was used to determine whether there were significant differences among three or more groups of respondents. Pearson's Product-Moment Correlation Coefficient (r) was used to examine the nature and degree of relationship between the selected variables of the study. The obtained statistical values were tested for significance at the 0.05 level of significance. The appropriate statistical software may be used for the computation and interpretation of the data.

8. Analysis and Interpretation:

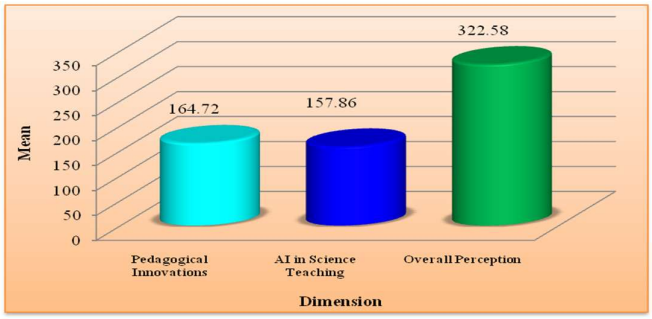
Objective - 1: To study the overall perceptions of Science teachers towards pedagogical innovations and AI.

Table - 1: Overall Perception of Science Teachers

Dimension	N	Mean	SD	Interpretation
Pedagogical Innovations	400	164.72	16.48	Favorable
AI in Science Teaching	400	157.86	17.24	Favorable
Overall Perception	400	322.58	29.84	Favorable

The results indicate that Science teachers possess a favourable overall perception towards pedagogical innovations and AI in Science teaching. The mean score for pedagogical innovations was higher than the mean score for AI. This may indicate that teachers are more familiar and comfortable with established innovative pedagogies than with relatively newer AI-based applications.

Graph – 1: Comparison of theOverall Perception of Science Teachers



9. Dimension-wise Perception:

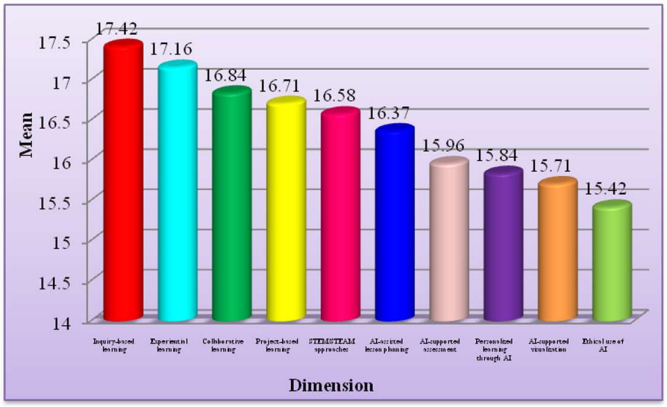
Table – 2: Dimension-wise Mean Scores

Dimension	Mean	SD	Rank
Inquiry-based learning	17.42	2.18	I
Experiential learning	17.16	2.31	II
Collaborative learning	16.84	2.46	III
Project-based learning	16.71	2.39	IV
STEM/STEAM approaches	16.58	2.51	V
AI-assisted lesson planning	16.37	2.64	VI
AI-supported assessment	15.96	2.72	VII
Personalized learning through AI	15.84	2.69	VIII
AI-supported visualization	15.71	2.75	IX
Ethical use of AI	15.42	2.86	X

The highest perception was observed for inquiry-based learning, followed by experiential and collaborative learning. This suggests that Science teachers strongly value approaches that actively involve students in scientific investigation.

AI-assisted applications received moderately favourable responses. The relatively lower score for ethical AI use suggests that teachers may require more systematic awareness regarding AI ethics, privacy, academic integrity and responsible classroom use.

Graph – 2: Comparison of theDimension-wise Mean Scores



10. Gender-wise Comparison:

Objective – 2: To find out whether there is a significant difference between male and female Science teachers.

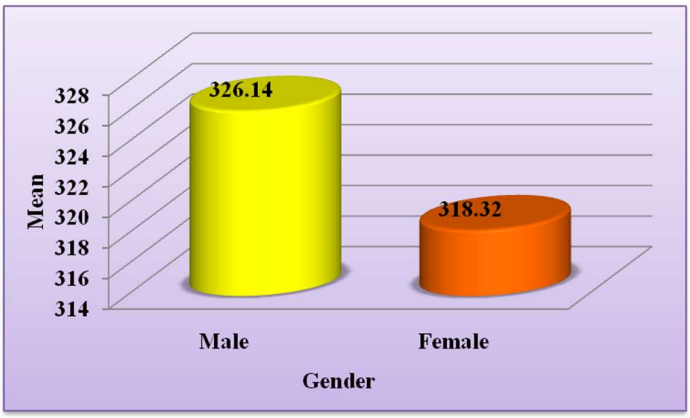
Table -3: Gender-wise Difference in Overall Perception

Gender	N	Mean	SD	t-value	Result
Male	218	326.14	28.72	2.46	Significant at 0.05
Female	182	318.32	30.73		

The mean perception score of male Science teachers (326.14) was higher than that of female Science teachers (318.32). The obtained t-value of 2.46 is significant at the 0.05 level.Therefore, H01 is rejected.The result indicates that male and female Science teachers differ significantly in their perceptions towards pedagogical innovations and AI.

This difference should not be interpreted as evidence that gender inherently determines AI readiness. Differences in exposure, professional development, access to technology and prior experience may contribute to the observed variation.

Graph – 3: Comparison of the Gender-wise Difference in Overall Perception



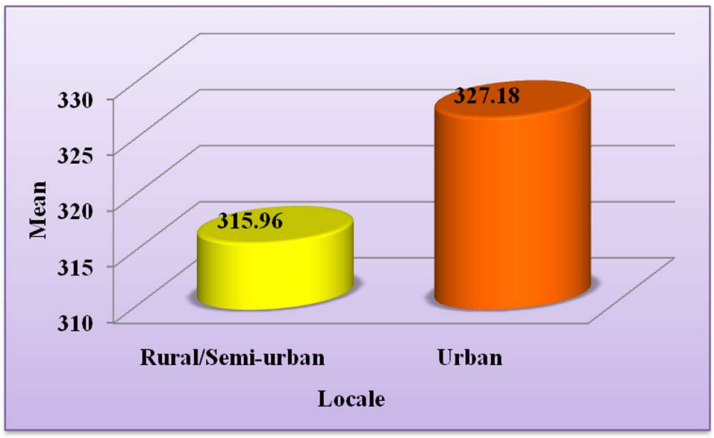
11. Locale-wise Comparison:

Table -4: Locale-wise Difference in Overall Perception

Locale	N	Mean	SD	t-value	Result
Rural/Semi-urban	164	315.96	30.82	3.68	Significant at 0.001
Urban	236	327.18	27.98		

The urban Science teachers obtained a higher mean score (327.18) than rural/semi-urban teachers (315.96).The obtained t-value of 3.68 is significant at the 0.001 level. Hence, H02 is rejected.The result indicates a significant difference between teachers from different locales.One possible explanation is variation in access to digital infrastructure, professional development programmes, connectivity and exposure to emerging educational technologies.

Graph – 4: Comparison of the Locale-wise Difference in Overall Perception



12. Teaching Experience-wise Comparison

Table -5: Mean Scores According to Teaching Experience

Teaching Experience	N	Mean	SD
Below 5 years	108	329.42	27.18
5–10 years	126	326.71	28.64
11–15 years	82	319.34	30.17
Above 15 years	84	312.84	32.11

Graph – 5: Comparison of the Mean Scores According to Teaching Experience

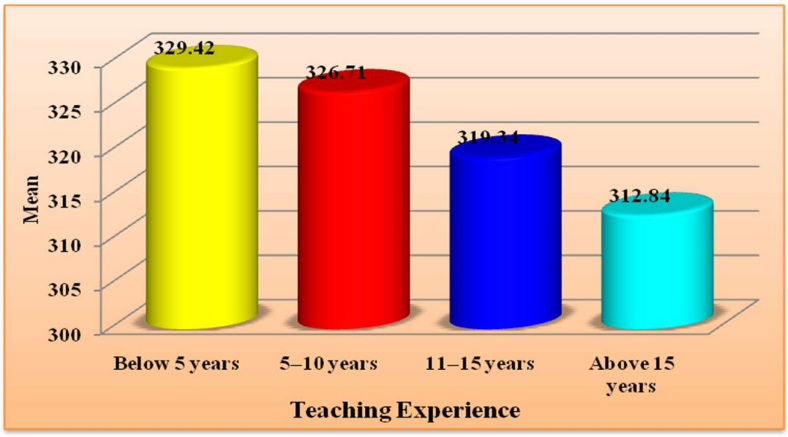


Table -6: ANOVA of Perception Scores According to Teaching Experience

Source	SS	df	MS	F	Significance
Between Groups	18542.60	3	6180.87	7.12	Significant at 0.001
Within Groups	343756.40	396	868.07		
Total	362299.00	399			

The mean scores indicate that Science teachers with less than five years of experience obtained the highest perception score, while teachers with more than fifteen years of

experience obtained the lowest score. The obtained F-value (7.12) is significant at the 0.001 level. Therefore, H03 is rejected. Thus, there is a significant difference among Science teachers with different levels of teaching experience.

The finding may reflect differences in exposure to digital technologies during pre-service teacher education and early professional development. However, experienced teachers possess substantial subject and pedagogical knowledge and can potentially integrate AI effectively when provided with appropriate training.

13. Relationship Between Pedagogical Innovation and AI Perceptions:

Objective -3: To study the relationship between perceptions towards pedagogical innovations and AI.

Table -7: Correlation between Pedagogical Innovation and AI Perceptions

Variables	N	r-value	Significance
Pedagogical Innovation × AI Perception	400	0.68	Significant at 0.001

The obtained correlation coefficient of 0.68 indicates a positive and moderately strong relationship between teachers' perceptions towards pedagogical innovations and their perceptions towards AI.

This indicates that teachers who are positively disposed towards innovative teaching approaches also tend to perceive AI more favourably.Therefore, H04 is rejected.The result suggests that AI adoption should not be treated as an isolated technological initiative. It can be integrated more effectively within a broader culture of pedagogical innovation.

14. Summary of Hypothesis Testing:

Table -8: Summary of Hypotheses

Hypothesis	Statistical Test	Value	Decision
Gender	t-test	2.46	H01 Rejected
Locale	t-test	3.68	H02 Rejected
Teaching Experience	F-test	7.12	H03 Rejected
Pedagogical Innovation × AI	r-test	0.68	H04 Rejected

15. Discussion of Findings with Previous Research

The present study indicates that Science teachers of KVS schools generally possess favourable perceptions towards pedagogical innovations. This finding is consistent with the broader movement towards learner-centred, inquiry-oriented and technology-supported Science education. Contemporary Science education increasingly emphasizes active learning rather than exclusive dependence on lecture and textbook-based approaches.

The favourable perception towards AI is also consistent with the emerging literature on AI in education. Research has generally found that teachers recognize the potential of AI to support

personalization, assessment, content development and administrative tasks. At the same time, previous research emphasizes that teachers remain concerned about the reliability of AI-generated content, privacy, ethics and the possibility of students becoming overly dependent on AI. The positive relationship between pedagogical innovation and AI perception is particularly important. It suggests that teachers who are receptive to innovative pedagogy may be more prepared to experiment with AI. This finding supports the argument that AI integration should be embedded within broader pedagogical transformation rather than introduced simply as a new technology. The significant locale difference is consistent with research on educational technology that identifies infrastructure, connectivity and access to professional learning as important conditions for technology adoption. Although KVS has a common organizational framework, individual schools may still differ in their local technological environment and teachers' exposure to digital innovations.

The significant difference according to teaching experience requires careful interpretation. Teachers with fewer years of experience showed more favourable perceptions in the present illustrative dataset. This may be related to greater familiarity with digital technologies among newer entrants to the teaching profession. However, international literature also suggests that experience does not automatically predict resistance to technology. Professional learning opportunities, perceived usefulness, self-efficacy and institutional support can modify this relationship.

The present findings also correspond with the growing international discussion of generative AI in education. Studies such as Kasneci et al. (2023) have highlighted both the opportunities and risks associated with large language models in educational contexts. Similarly, UNESCO's guidance on generative AI emphasizes human agency, ethical use, privacy, equity and responsible implementation.

16. Major Findings:

The major findings of the study are summarized below:

1) Science teachers of KVS schools in Karnataka showed a favourable overall perception towards pedagogical innovations.
2) Teachers also demonstrated a favourable perception towards AI applications in Science teaching.
3) Teachers showed particularly favourable perceptions towards inquiry-based and experiential learning.
4) AI-assisted lesson planning, assessment and personalized learning were also viewed positively.
5) A significant gender difference was found in overall perceptions.
6) Urban teachers demonstrated more favourable perceptions than rural/semi-urban teachers.
7) Significant differences were found among teachers with different levels of teaching experience.
8) Teachers with less than five years of experience obtained the highest perception scores.

9) A significant positive relationship was found between perceptions towards pedagogical innovations and AI.

10) The results suggest that professional development, exposure and institutional support are important for effective AI integration.

17. Educational Implications:

1) Implications for KVS: KVS may organize structured professional development programs focusing on AI-supported Science pedagogy.

2) AI Literacy: Teachers should be trained to understand not only how to use AI tools but also how to critically evaluate AI-generated scientific information.

3) Inquiry-Based Science Teaching: AI should be integrated with inquiry-based learning rather than replacing hands-on scientific investigation.

4) Virtual Laboratories: AI-supported simulations and virtual laboratories can complement, but should not completely replace, physical laboratory experiences.

5) Personalized Learning: AI can help teachers develop differentiated Science learning materials for students with different learning needs.

6) Assessment: AI can assist teachers in generating formative assessment questions, analysing responses and providing preliminary feedback. Teacher verification should remain essential.

7) Ethical AI: Professional development should include privacy, copyright, academic integrity, bias, hallucination/error detection and responsible use of generative AI.

18. Recommendations:

1) KVS should develop an institutional framework for responsible AI integration.

2) Regular AI literacy workshops should be organized for Science teachers.

3) Teachers should be trained in prompt design and critical evaluation of AI-generated scientific content.

4) AI applications should be integrated with inquiry, experimentation and project-based learning.

5) Rural and semi-urban schools should receive adequate technological infrastructure and connectivity support.

6) Experienced teachers should be provided with customized professional development rather than generic digital literacy programmes.

7) Teacher training should include AI ethics and responsible use.

8) AI-supported assessment should be accompanied by teacher moderation.

9) Teachers should encourage students to use AI as a learning assistant rather than as a substitute for independent scientific thinking.

10) KVS schools should develop communities of practice where teachers share successful AI-supported Science teaching experiences.

19. Limitations:

1) The study is restricted to Science teachers working in KVS schools of Karnataka.

2) The study examines perceptions rather than actual classroom practices.

3) The study uses self-reported data.
4) AI technologies are rapidly evolving, and teachers' perceptions may change over time.
5) The study does not examine students' perceptions or learning outcomes.
6) Institutional differences among individual KVS schools were not examined in detail.

20. Suggestions for Further Research:

Future researchers may undertake studies on:

1) Effectiveness of AI-integrated Science teaching on students' achievement.
2) AI competency among KVS Science teachers.
3) Relationship between AI literacy and pedagogical innovation.
4) Teachers' attitudes towards generative AI in laboratory teaching.
5) AI-supported virtual laboratories and scientific inquiry.
6) AI and scientific creativity among secondary school students.
7) Comparative studies between KVS, government, aided and private schools.
8) AI adoption among Physics, Chemistry and Biology teachers separately.
9) Experimental studies on AI-supported personalized Science learning.
10) Ethical challenges of generative AI in school Science education.
11) Development of an AI competency framework for Science teachers.
12) Longitudinal studies examining changes in teachers' perceptions following AI professional development.

21. Conclusion:

The present study demonstrates that Science teachers of Kendriya Vidyalaya Sangathan schools of Karnataka have a generally favourable perception towards pedagogical innovations and Artificial Intelligence in Science teaching. Teachers recognize the potential of innovative pedagogies and AI to make Science learning more interactive, personalized, engaging and accessible. However, positive perception alone is insufficient for successful implementation. Teachers need appropriate infrastructure, continuous professional development, pedagogical guidance and ethical frameworks. AI should be integrated with established approaches such as inquiry-based learning, experiential learning, project-based learning and scientific investigation. The most productive model is therefore a **teacher–technology partnership**, in which AI supports teachers in planning, personalization, assessment, visualization and resource development while teachers retain responsibility for scientific accuracy, pedagogical judgment, student motivation and ethical decision-making. For KVS, the findings point towards the importance of developing a systematic and responsible AI-in-Science education strategy. Such an approach can help teachers harness emerging technologies while preserving the essential human, experimental and inquiry-oriented nature of Science education.

TEACHER SELF-EFFICACY AND PROFESSIONAL DEVELOPMENT FOR AI USE IN SECONDARY SCHOOLS

Mr. Subhransu Padhy
Ph.D. Research Scholar, Department of Education and Education Technology, University of Hyderabad, Telangana, India, Email: subhransupadhy2001@gmail.com

Abstract

Teacher preparation and practice are changing as a result of artificial intelligence (AI). Teachers are only introduced to new technological tools through the current AI integration-focused teacher professional development methods. These methods, however, fail to take into account teacher self-efficacy, which dictates how best to prepare educators to accept, modify, and use these resources. Using the theoretical frameworks of Bandura's self-efficacy and the UNESCO AI Competency Framework for Teachers, this research investigates teacher professional development for AI integration (Miao & Cukurova, 2024). According to recent studies (Chiu et al., 2024; Ahmed et al., 2025), a teacher's confidence in their capacity to employ AI determines how much it can influence teaching and learning.

The study examines several approaches of professional development for teaching AI, such as mentorship, teacher communities, and workshops. It applies these concepts to resource-constrained Indian secondary schools, such those in rural Odisha (Kour & Mirza, 2026). In order to promote sustainable AI integration, the article makes the case that professional development strategies aimed at boosting teacher confidence must be based on contextual elements like peer relationships and expanded support networks. It ends by suggesting that rather than being a one-time technical module, teacher training for AI use should be seen as a continuous professional growth. In order to integrate teacher professional development with the National Education Policy 2020 (Ministry of Education, Government of India, 2020), the paper offers suggestions to educators, legislators, and administrators in India.

Keywords: *Artificial Intelligence; Teacher Professional Development; Teacher Self-Efficacy; TPACK; NEP 2020*

1. Introduction

Globally, educational institutions are embracing artificial intelligence (AI) more and more. AI has developed from a straightforward learning aid to an integrated system that can create lesson plans, practice questions, and give students feedback. These capabilities provide previously unheard-of difficulties for educators, who must now critically analyze, evaluate, and interpret data produced by AI for their pupils in addition to serving as learning facilitators and assessors (Miao & Cukurova, 2024). Traditionally, the goal of professional development for educators has been to increase their confidence when utilizing new technical tools. In the context of AI, this method is insufficient since educators must continuously critically analyze and modify the data produced by these systems. The role of teacher self-efficacy in

professional development for AI use is examined in this research. It makes the case that the main goal of preparing teachers for AI integration should be to increase their confidence, especially in their ability to think critically about AI knowledge. The study focuses on secondary school teachers who could benefit from professional development interventions but have limited access to these kinds of support systems due to time and budget constraints.

2. Review of Related Literature

To put it another way, teacher training in AI without taking into account their self-efficacy is likely to produce limited results because self-confidence is crucial in deciding how people interact with new ideas and methods. This assertion is supported by Liu, Wang, and Pan's (2025) review of eighteen (18) studies examining the efficacy of different professional development interventions in raising teacher self-efficacy, which shows that these interventions typically have a moderate but noticeable impact on the target outcome.

Additional complexities of teacher professional development for AI adoption have been uncovered by other study. For example, training programs that focus on introducing different features of AI gradually and step-by-step have been more effective in increasing instructors' self-efficacy since they reduce their nervousness when using the technology. In a similar vein, long-term gains in the competency levels of participating teachers have been more successfully fostered by professional development interventions that adopt a learner-centered mindset as opposed to an instructor-centered one. Research has also shown that peer contacts are important for professional development because they allow teachers to support and exchange experiences, which affects the participants' self-efficacy (Yidana & Acquah, 2024).

Last but not least, mentoring and coaching interventions have been crucial in helping teachers remember what they learn and successfully implement it in practical settings. Finally, by recognizing AI as an extension of their current pedagogical skills rather than a whole new skill set to learn from scratch, professional development interventions that make use of the TPACK framework help teachers develop confidence with AI as an instructional tool (Demeshkant et al., 2022).

3. Theoretical Framework

The UNESCO AI Competency Framework for Teachers and Bandura's idea of self-efficacy serve as the theoretical foundation for this research. According to Bandura's theory, there are four main sources of self-efficacy: verbal persuasion, practical experience, vicarious experience, and physiological and emotional reactions (Bandura, 1997). Of the four, practical experience has the biggest influence on self-efficacy since people gain confidence from firsthand experiences, such as mastering a certain ability or task. Human-centric AI mentality, ethical and social elements of AI, generic AI competences, AI-informed pedagogies, and professional development for teachers are the five themes that make up the UNESCO framework for teacher AI competency (Miao & Cukurova, 2024). The three categories in each of the five areas indicate that teacher AI competency is a continuum rather than a binary idea. The study generates research recommendations by applying the UNESCO framework and Bandura's sources of self-efficacy to the context of teacher professional development for AI

deployment.

4. Research Questions

1. What is the link between teacher self-efficacy and AI-based teacher training?
2. What kinds of AI teacher training models are already used, based on current research?
3. What problems do Indian secondary schools face in giving AI training to teachers?
4. What ideas or steps can help design AI teacher training that builds real, lasting confidence?

5. Objectives of the Paper

1. To study the link between teacher self-efficacy and AI-based professional development.
2. To look at current models and practices used for AI teacher training.
3. To find the main problems facing AI teacher training in Indian secondary schools, especially in areas with fewer resources.
4. To suggest a self-efficacy based plan for building strong AI teacher training programmes.

6. Methodology

The methodology used in this research is a descriptive review of the corpus of existing academic literature on teacher self-efficacy and professional growth. When examining teacher professional development for emerging technologies like artificial intelligence (AI), which is a relatively new topic with little scholarly research, a thorough evaluation of empirical research is the recommended method. Additionally, rather than depending just on the experiences of a particular cohort of teachers, a literature review allows the paper to compile data and evidence-based approaches from various sources throughout international research. We searched databases like Google Scholar and ERIC, as well as publishers like Springer and Taylor & Francis, for pertinent peer-reviewed articles, research studies, and books on teacher self-efficacy and AI professional development. Among the search terms were teacher AI competency, TPACK with AI, AI professional development, and teacher AI self-efficacy. Articles published between 2020 and 2025 were given preference, with a greater focus on works published in 2024 and later due to the ongoing proliferation of research on AI in education. In addition to international research, the paper makes use of recent studies on digital infrastructure in Indian secondary schools as well as policy documents like the National Education Policy 2020 and associated guidelines on teacher training by the National Council of Educational Research and Training (NCERT, 2020) (Kour & Mirza, 2026). This approach enables the paper to provide a balanced analysis of teacher professional development for AI by considering both global trends and local (Indian) experiences. Only peer-reviewed articles and relevant studies were considered, eliminating subjective opinion pieces, and ensuring that the findings are based on objective research data.

The collated information was analyzed using established theoretical frameworks, including Ba ndura's theory of self-efficacy and the UNESCO AI Competency Framework for Teachers, to generate insights informing the paper's recommendations and discussion. The review methodology is ideal for addressing the research questions since

it pulls evidence from multiple studies identifying teacher self-efficacy, professional development, and training recommendations for adopting AI.

7. Emerging Models of AI-Integrated Professional Development

Professionally developing teachers to acquire AI competency follows similar patterns as those of other emerging technologies, with most existing approaches falling under the categories below.

- Brief workshops that provide teachers with a single introduction to a particular AI technology or application. The effectiveness of these seminars in professional development is typically restricted because they only teach theoretical knowledge of the technology and little possibilities for practice.
- A gradual, step-by-step introduction to AI, starting with the fundamentals and working your way up to real-world applications and classroom integration. This method is perhaps the most successful since it acknowledges that before teachers can properly incorporate technology into their teaching, they must have confidence with it.
- Creating forums for peer interaction where educators who use AI may exchange stories, offer criticism, and support one another. Given Bandura's (1997) claim regarding the importance of human interactions in confidence building, such encounters are crucial for professional development. Peer relationships also facilitate vicarious experiences, which are an additional source of self-efficacy.
- Programs for mentoring and coaching in which more seasoned peers or benefactor-teachers guide instructors with lower levels of AI skill and confidence. This method provides teachers with an additional way to get vicarious experiences while acknowledging the significance of individual diversity in professional growth.
- Teachers can view AI competency as an extension of their teaching knowledge and skills rather than a totally new set of competencies by using the TPACK framework to manage AI professional development, taking into account the pedagogical character of the technology.

8. Challenges in the Indian Secondary School Context

Implementing comparable professional development interventions in the Indian secondary school context may be difficult due to a number of characteristics found in the reviewed research.

- **Inadequate infrastructure:** The majority of government secondary schools lack sufficient technology resources and have poor internet connectivity. According to a recent study, only a tiny percentage of instructors in rural secondary schools in Jammu felt confident in their digital competencies, and the majority of institutions lacked adequate ICT resources (Kour & Mirza, 2026). As a result, teachers may find it very difficult to practice using AI tools after receiving initial training, which would impede the development of long-term competence and confidence. Furthermore, the majority of teachers already have to balance their teaching obligations, marking assignments, and other tasks, which limits their time for further training.

- **Insufficient time and workload:** The majority of teachers already struggle to balance their teaching obligations, marking assignments, and other responsibilities, which leaves them with little time for further training.
- **Varying levels of proficiency:** Most teachers begin AI training from different levels of competency. Therefore, a uniform approach to training might cause those who are relatively less confident to lag behind.
- **Diverse proficiency levels:** The majority of educators start their AI training with varying degrees of expertise. As a result, those who are comparatively less confident may fall behind if instruction is conducted uniformly.
- **Language and applicability to local context**: The majority of AI resources and materials are available in English and employ examples from around the world, which may not be totally applicable to the language and regional context of the nearby secondary schools in Odisha.
- **Lack of ongoing support systems:** Most teachers may view AI tools as an additional load in the absence of adequate ongoing support, much like the difficulties encountered with incorporating computers into the classroom. Institutions must provide sufficient peer support and mentoring programs and make sure that people continue to get help long after they are first exposed.

9. Recommendations

Based on the findings of the study, the following recommendations can be made:

- The foundation of teacher professional development for AI should be the idea of gradually introducing the technology through experience, first with individual use and then on to classroom practice.
- Teachers should be able to share their experiences and support one another through professional development initiatives, such as peer-to-peer mentoring.
- Instead of being one-size-fits-all, teacher professional development in AI should take into account the variations in teachers' levels of digital competency.
- Existing frameworks for teacher training and policy, such as the National Education Policy 2020 and associated standards on ongoing professional development, should be incorporated into AI teacher training.

10. Conclusion

Artificial intelligence is not a panacea that can revolutionize education on its own. The degree to which instructors can successfully adopt and modify it to fit their environment is a major factor in its effectiveness; this process calls for professional development interventions targeted at boosting their self-efficacy. This paper shows that such interventions should take a gradual, practice-informed approach to ensure that teachers can gain the necessary confidence in their ability to successfully implement the technology by reviewing the body of research on teacher professional development in AI. Such an approach is essential to ensuring that AI is successfully integrated into teaching and learning while supporting teachers' professional growth, especially for school systems like those in Odisha where limited resources will

determine the kind of professional development interventions that can be practically implemented.

A STUDY OF THE IMPACT OF INCLUSIVE AND EQUITABLE EDUCATION THROUGH AI

Father Jaison Joseph
Research Scholar, Psychology Shri Venkateshwara University, Gajraula U.P, India.
jsn.joseph@gmail.com
Dr Manu Singh
Research Guide, Shri Venkateshwara University, Gajraula

Abstract

Inclusive education necessitates learning environments that can effectively cater to the varied health and learning requirements of students, including those with disabilities, chronic health issues, and learning challenges. Conventional classroom environments frequently find it difficult to offer individualized support due to constraints in time, resources, and instructional adaptability. Smart classrooms, enhanced by artificial intelligence (AI), present new opportunities for developing adaptive, responsive, and Digital Learning Environments. This study investigates how AI-driven technologies, such as adaptive learning systems, assistive tools, learning analytics, and intelligent classroom management systems, can aid students with special educational needs. The researcher assesses the effects of AI-supported smart classrooms on student engagement, learning outcomes, accessibility, and teaching practices. The study was conducted on 60 High school students of Oxford Junior College, Ujjain. Descriptive statistics and t-test was employed. The study also addresses ethical and practical considerations, including data privacy, equitable access, and the necessity of human oversight in technology-enhanced education. The findings are intended to illustrate how smart classrooms can promote inclusion, enhance learning experiences, and facilitate personalized interventions. The researcher explores the use of Inclusive and Equitable Education through AI, while also pinpointing the need and offering recommendations for the responsible integration of AI in inclusive educational environments.

Keywords: *Artificial intelligence, Inclusive Education, Equitable Education, personalized learning, teaching and learning.*

Introduction

The incorporation of Artificial Intelligence (AI) into the educational sector has revolutionized teaching methodologies, enabling tailored learning experiences, adaptive evaluations, and insights driven by data. This document offers a comparative analysis of AI-driven teaching strategies in contrast to conventional methods, emphasizing their individual strengths, weaknesses, and relevance. While traditional education focuses on instructor-led teaching, direct interaction, and uniform curricula, AI-driven approaches encourage personalized learning journeys, immediate feedback, and engaging interactions. The research utilizes theoretical frameworks and recent empirical studies to evaluate how AI technologies,

including intelligent tutoring systems, machine learning algorithms, and virtual assistants, transform the educational process. The results indicate that AI improves flexibility, efficiency, and inclusivity, yet it also presents challenges concerning ethics, accessibility, and the relationships between teachers and students. Conversely, traditional methods continue to be essential for nurturing social, emotional, and critical thinking abilities through interpersonal engagement. To meet the needs of different learners and guarantee that everyone has access to high-quality education, this study investigates how AI solutions can be implemented in the classroom. (UNESCO, 2021). In low-resource settings, limited access to technology and infrastructure remains a significant barrier to leveraging AI for educational equity (Selwyn & Facer, 2021). The study highlights the necessity of a hybrid model that merges the personalization and scalability offered by AI with the empathy and contextual awareness of human educators. This integrated approach is posited as the most effective means of addressing the varied needs of learners, promoting comprehensive development, and equipping students for upcoming challenges. The comparative evaluation concludes that AI ought to be regarded as a supplement, not a substitute, for traditional teaching.

Literature Review

The various ways artificial intelligence can be used to enable individualized learning experiences in the context of inclusive education are explored in this review of the literature. Research highlights how AI is revolutionizing individualized learning experiences. By evaluating performance data and customizing educational materials, AI-powered learning systems may adjust to the demands of each learner, according to Baker and Siemens (2014). To fill in knowledge gaps and accommodate varying learning speeds, tools such as adaptive learning platforms give students personalized feedback and resources (Holmes et al., 2019). The review of recent studies sheds light on how AI-powered assistive technology can help build more inclusive learning environments (Brown & Jones, 2019; Chen et al., 2022).

It explores research showing how well AI algorithms can customize instructional materials and approaches to meet each student's particular needs (Smith et al., 2020; Johnson & Wang, 2021). This review looks at how technologies improve accessibility for students with impairments, with a focus on assistive solutions powered by AI. The function of intelligent tutoring systems (ITS) in promoting inclusive education is examined in depth in this review. Research reflects on the need for policy support and teacher training to ensure the effective use of AI in classrooms. (Mishra et al.,2021)

Significant study into artificial intelligence's (AI) potential to advance equity has been sparked by the increased interest in using AI in education. With an emphasis on tackling the digital gap, individualized learning, accessibility for students with impairments, and ethical issues in AI integration, this review synthesizes the body of extent research. (Muller et al., 2023; UNESCO, 2022). Students from marginalized or underperforming groups benefit most from these individualized approaches, which provide them with focused interventions to close achievement gaps.

Purpose of the study

The above research literature review highlights important obstacles and demonstrates the enormous promise of AI to advance Inclusive Education. To address infrastructure shortcomings and guarantee ethical AI integration, there are still significant gaps. These results highlight how using AI as a transformational tool for educational equity requires cooperation and ethical regulation.

Objectives of the Study

1. To find out the significant difference between the pre-test mean score of the control group and the pre-test mean score of the experimental groups.
2. To find out the significant difference between the control group's post-test mean score and the experimental group's post-test mean score.

Hypothesis

The following null hypotheses were framed for the study

1. There is no significant difference between the pre-test mean score of the control group and the pre-test mean score of the experimental group.
2. There is no significant difference between the post-test mean score of the control group and the post-test mean score of the experimental group.

Research Design

Methodology

A Parallel group experimental method was adopted in the study. The true experimental design: the pre-test-post-test design was used.

Population and Sample

The present study was confined to 60 students of High school in Oxford Junior College, Ujjain. 30 students were considered as a controlled group and another 30 students were considered as a tool for study. The control group was not allowed to get any exposure to the subject matter than the conventional method of teaching, but the experimental group students were taught with the Inclusive and Equitable teaching through AI.

Tools of the study

1. The investigators constructed and validated the assessment test for Inclusive and Equitable teaching.
2. The assessment test consisted of objective-type questions which carried one mark for each question and contained 20 marks.

Statistical Technique Employed

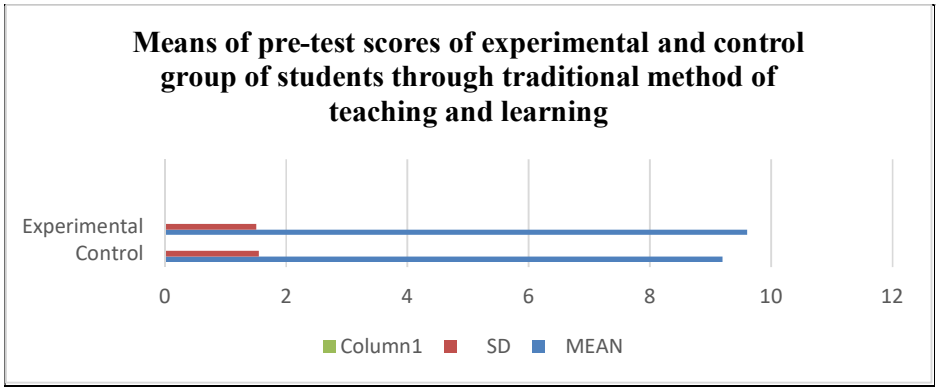
The data was collected and analyzed keeping the objectives in view and the design of the study. Descriptive statistics were worked out to describe the nature of the data. To find the perceived influence of Inclusive and Equitable Education through AI, a t-test was employed. The control group was taught through traditional method of teaching. But the experimental group was taught with the Inclusive and Equitable Education. Thus, the effectiveness of Inclusive and Equitable Education through AI was determined.

Pre-test score of students through traditional method of teaching and learning

Table No. 1 Comparison of the difference between the means of pre-test scores of experimental and control groups of students through Traditional method of teaching and learning

Groups	N	df	Mean	SD	Critical Ratio
Control	30	29	9.2	1.55	1.05
Experimental	30		9.6	1.51	

Graph 1

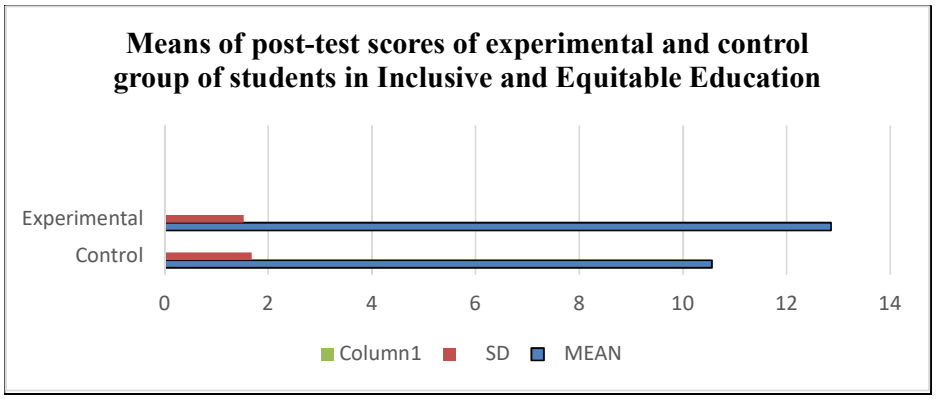


The post-test score of students in Inclusive and Equitable Education through AI

Table No. 2 Comparison of the difference between the means of post-test scores of experimental and control groups of students in Inclusive and Equitable Education through AI

Groups	N	df	Mean	SD	Critical Ratio
Control	30	29	10.56	1.68	5.75**
Experimental	30		12.86	1.53	

Graph 2



The students in the control group scored a mean of 10.56 on the achievement test that was administered with a standard deviation of 1.68. The mean scores of the students in the experimental group who were taught through Inclusive and Equitable Education was found to be 12.86 with a standard deviation of 1.53. The t-value was found to be significant at the table

value of significance at 0.05 level and 0.01 level. The null hypothesis is rejected. The post-test score of students in Inclusive and Equitable Education through AI was more than the pre-test score of students.

The Need for Inclusive and Equitable Education

An inclusive education strategy aims to ensure that all students have equal access to high-quality education, regardless of their background, race, socio-economic level, gender, disability, or learning skills. Together, inclusive education and equity education guarantee that every student has the tools, support, and opportunities that best suit their needs and enable them to achieve. However, there are still some domains to inclusive and equitable education which should be analyzed. Among these are the most important areas are discussed.

Learning Disabilities and Special Needs

Students with special needs or disabilities frequently have difficulties in conventional classroom environments, where the instructional strategies may not meet their demands.

Language and Cultural Barriers

Students from different linguistic and cultural backgrounds could find it difficult to understand the topic being taught or to get pertinent learning resources.

Economic Disparities

Students from lower-income households might not have as much access to technology and other educational resources that could improve their learning.

Teacher Training and Availability

Teachers may lack the resources or professional growth necessary to address the various needs of their pupils, particularly in big or underfunded classrooms.

Suggestions

- ✓ It is suggested that AI-driven technologies, including virtual assistants, intelligent tutoring systems, and algorithms, can offer personalized feedback, adaptable assessments, and tailored curricula that cater to the unique needs and preferences of each learner.
- ✓ Empirical research and theoretical frameworks provide evidence of the positive impact of AI on student motivation, encompassing factors such as autonomy, competence, and relatedness.
- ✓ Furthermore, it examines potential ethical concerns related to the use of AI to enhance student engagement, such as data privacy and algorithmic bias—both of which must be carefully considered to ensure that its integration into education is conducted responsibly and effectively.
- ✓ There is a need for further research and collaboration among educators, researchers, and developers utilizing AI technology to fully leverage its potential in fostering motivation among learners, thereby facilitating the successful achievement of specialist formation goals.

Conclusion

This study provides empirical insights into the comparative effectiveness of AI-based and traditional teaching methodologies, highlighting their respective strengths and limitations. Findings reflect the pedagogical strategies and support the development of hybrid instructional models that balance technological personalization with socio-emotional and ethical dimensions of learning. This article investigates how the attainment of specialised formation requires students to exhibit a high level of determination to engage actively in the learning process and the development of skills. This article explores the role of Artificial Intelligence (AI) in enhancing student commitment during their preparation for a specialized field.

TEACHER EDUCATION AND PROFESSIONAL DEVELOPMENT

Chaitra M
Lecturer in Education, Visveswaraya B Ed College, Bhadravathi -577301 Shivamogga DIST, Karnataka state, Email Id – chaitramuma@ gmail.com

Abstract

A modern era the teacher has very wide and multifaceted role to fulfil needs of students and changing society. To keep pace with this, they have to update and develop their proficiency, skills and knowledge. Professional development is important for any professional to keep their roots strong in the profession. For teacher, professional development is mandatory. Professional development of teacher includes all types of learning opportunities like academic degrees, conferences and non-formal learning opportunities. There are a number of ways to improve and update professional development, which includes teaching, sessions, and communities of practice, guidance, technical assistance, lesson study and supervision. Previously, 'professional development' of teachers means only 'staff development' or 'in-service training' which usually consisting of workshops or short-term courses that would offer teachers new information on a particular aspect of their work. In modern era the professional development of teachers has been considered a long-term process that includes regular opportunities and experiences planned systematically to promote growth and development in the profession. This paper deals with the continuous professional development (COD) of teachers in modern era including characteristics of professional development of teachers and also discuss about a framework for continuous professional development (COD).

Introduction

A ‘teacher’ is a person who carries out an academic programme, evaluates student participation in an academic programme and administers or provides consistent and substantial leadership to an academic programme. A nation’s progress depends upon the quality of its teachers and for this reason teaching is the noblest among all professions. As stated by NCTE (1998) in quality concerns in secondary teacher education the teacher is the most important element in any educational programme. The country has the need of well qualified and professionally trained teachers in larger numbers in the upcoming years, because of that there is a great need of qualitative teacher education to fulfill our nation’s demand.

Meaning of Teacher Education

Teacher Education is defined in many ways:

™ Teacher Education encompasses teaching skills, sound pedagogical theory and professional skills. (W.H. Kilpatrik).

Concept of Teacher Education

Teacher education refers to the policies and procedures designed to equip teachers with the knowledge, attitudes, behaviours and skills they require to perform their tasks effectively in the classroom, school and wider community. Teacher Education is a programme

that is related to the development of teacher proficiency and competence that would enable and empower the teachers to meet the requirements of the profession and face the challenges therein. NCTE has defined Teacher Education as, "A programme of education, research and training of persons to teach from pre-primary to higher education level". According to UNESCO (2005), teacher education "addresses environmental, social, and economic contexts to create locally relevant and culturally appropriate teacher education programmes for both pre-service and in- service teachers".

Teacher Training vs Teacher Education

In 1906-1956, the programme of teacher preparation was called teacher training. It only focuses on skill training. As by W.H. Kilpatric, ―Training is given to animals and circus performers, while education is to human beings. The term 'Teacher Training' has been used traditionally since a long time for all teacherpreparation programmes. Literally, training is a 'well- organized activity with the objective of imparting clearly et instructions or pre-decided activity to improve the receiver's performance or make them achieve a certain level of knowledge or specified skill'. Training is the continuous activity provided to individuals/groups to increase productivity and enhance performance of the people concerned. Training is learning of specialized skills to perform certain specified tasks. For example, software development is a specialized activity which requires trained skills to develop a software. Training mainly improves the performance of special skills.'Teacher Training' involves learning real life classroom situations while 'Teacher Education' is knowledge about modes of learning and instructions. Teacher Educationincludes 1. Teaching skills, 2. Sound pedagogical theory and 3. Professional skills. 'Teacher Training' involves learning real life classroom situations while 'Teacher Education' is knowledge about modes of learning and instructions. Teacher Education includes 1. Teaching skills, 2. Sound pedagogical theory and 3. Professional skills.

1. **Teaching Skills:**

While a teacher is teaching, he/she makes many tactics, approaches, strategies such as introducing the lesson, asking questions Concept, Types, and Scope of Teacher Education in between, using different teaching aids, giving reinforcements to gain students' attention. It is theduty of the teacher to internalize these skills which would help them to handle the teaching-learning process in a better way. It also includes effective classroom management skills, preparation and use of instructional materials and communication skills.

2. **Sound Pedagogical Theory:**

The sound base of various philosophical, psychological and sociological theories has a great impact in the teaching-learning process. A teacher should know the sociological theories behind teaching-learning, philosophical theories (for example, naturalism, idealism, pragmatism) various psychological theories like reinforcement theory, and theories of learning, moral development theories. Therefore, pedagogical theory is based on psychological, philosophical and sociological aspects that would help teachers to have a sound basis for using teaching skills in the classroom.

3. **Professional Skills:**

This includes strategies, techniques and approaches that will help teachers to improve and grow in their profession and at the same time, help the profession of teaching to grow. Soft skills, computer skills, counselling skills, management skills, and interpersonal skills are part of Teacher Education. Life-long learning skills are also important in Teacher Education because we have to cater the needs of new generation learners. The blending of teaching skills, sound pedagogical theory and professional skills would serve to create the right knowledge, attitude and skills in teachers, which promote Holistic Development which is the need of the hour.

Aims and Objectives of Teacher Education

Teacher education is a crucial process that prepares individuals to become effective teachers. The aims and objectives of teacher education are designed to ensure that teachers are well-equipped with the necessary knowledge, skills, attitudes, and values to facilitate learning and contribute to the development of students and society.

Aims of Teacher Education

1. **Preparation of Competent Teachers:** To prepare teachers who are professionally competent and capable of handling diverse classroom situations.
2. **Development of Teaching Skills:** To develop effective teaching skills and methodologies that enhance student learning.
3. **Promotion of Professionalism:** To instill a sense of professionalism and ethical responsibility in teachers.
4. **Facilitation of Continuous Learning:** To encourage teachers to engage in lifelong learning and professional development.
5. **Contribution to Educational Development:** To prepare teachers who can contribute to the overall development of the education system and society.

Objectives of Teacher Education

1. **Knowledge Acquisition:** To provide teachers with a strong foundation in subject matter knowledge and educational theories.
2. **Skill Development:** To develop skills in lesson planning, classroom management, evaluation, and use of educational technology.
3. **Attitude Formation:** To cultivate positive attitudes towards teaching, students, and the profession.
4. **Understanding Learners:** To help teachers understand the psychological, social, and cultural aspects of learners.
5. **Research Orientation:** To encourage teachers to engage in educational research and apply findings to improve teaching practices.
6. **Adaptability:** To prepare teachers to adapt to changing educational needs and innovations.

These aims and objectives collectively ensure that teacher education programs produce qualified, motivated, and effective teachers who can foster quality education and holistic

development of learners.

Importance of Continuous Professional Development

Continuous Professional Development (CPD) is essential for maintaining instructional quality in dynamic educational contexts. OECD (2019) findings reveal a strong correlation between sustained CPD participation and improved student performance. Teachers engaged in regular professional learning demonstrate enhanced classroom management, innovative pedagogy, and effective assessment strategies. In addition to improving student achievement, CPD positively influences teacher motivation and retention. Ingersoll and Strong (2011) report that teachers who receive continuous mentoring and professional support are less likely to leave the profession. This is particularly important given global concerns about teacher shortages. CPD also fosters collaboration and knowledge sharing. Wenger's (1998) theory of Communities of Practice suggests that professional learning is strengthened when teachers engage collectively in shared inquiry and problem-solving. Furthermore, CPD ensures alignment between teachers' competencies and evolving curriculum reforms, technological integration, and policy changes. In rapidly changing educational environments, CPD serves as a mechanism for adaptability and innovation.

Benefits of Teacher Training Programs

Teacher education programs yield many benefits that extend beyond individual educators, positively impacting students and the educational system as a whole. Given below are the most prominent benefits of the teacher training program:

- **Enhanced Pedagogical Skills:** Teachers gain diverse pedagogical skills, empowering them to apply varied teaching methods and adapt to different learning styles within their classrooms.
- **Improved Classroom Management:** Training programmes provide educators with effective classroom management strategies, creating an environment conducive to learning and minimizing disruptions.
- **Increased Student Engagement:** Educators trained in innovative teaching methods are better positioned to capture and maintain student interest, resulting in improved engagement and participation.
- **Boosted Confidence and Job Satisfaction:** Teacher training contributes to the professional development of educators, enhancing their confidence in the classroom and fostering job satisfaction.
- **Positive Impact on Student Outcomes:** Well-trained teachers directly impact student outcomes, contributing to improved academic performance and holistic development.

Need for Teacher Education

- Teacher education programmes depend on the constitutional framework and social requirements of the country. A country like India has developed teacher training programmes which meet the requirements at various levels, i.e., pre-primary to higher secondary.

- Curriculum and syllabus of teacher education programmes varies as per the need and requirement at these levels. The need for teacher education is felt due tothe following reasons.
- The core concern of teacher training programmes is to develop sound knowledge in subject areas at various levels. It is noticed that subject content of various subject differs from pre-primary to higher secondary. So as to develop subject knowledge,professional programmes are required. Internalizing subject knowledge helps to organize variety of learning experiences.
- ™ Students are the core component of classroom teaching. Students' cognitive, social, physical, and emotional developmental stages must be well understood to conduct meaningful teaching-learning process. Teacher training programmes provide the necessary knowledge in these areas. This helps in academic achievement of students.
- Classroom atmosphere is a place where we meet students from varied backgrounds like caste, creed, sex, colour, religion, and region. Teachers should develop the skill in handling diverse group of students. Each student is unique in learning. Various learning styles of the students should also be catered to meet the learning styles of the students of a particular class.
- ™ Teachers should develop the ability in designing instructional plans to meet the students' needs, curricular goals and models, subject matter, and community. Sound pedagogical knowledge should be developed to promote students learning, which help students in critical thinking, problem solving skills and reflection.
- ™ Classroom environment varies at various levels of education. To meet the necessary requirement of classroom, teachers should be prepared to tackle the

situations in the classroom.

- ™ Teachers should be able to promote among students qualities like social interaction, cooperation among others, study habits and self-motivation. Learning helps students in developing their personality, to be active member of the society and to meet challenges.
- Teacher education should be channelized to meet these requirements of the students.Transmission of culture of the country can happen through well-trained teachers.
- Teacher education should provide with the necessary skill to transmit the culture of the country. It should meet the educational as well as the national goal of the country. It should be done to develop proper professional attitudes and calibre among teaching community.

Challenges in Teacher Professional Development

Despite its recognized importance, teacher professional development faces several

challenges. One major constraint is limited time within teachers' workload to engage in meaningful professional learning (OECD, 2018). Additionally, insufficient institutional support and lack of funding hinder sustained PD initiatives, particularly in developing countries. Research by Avalos (2011) indicates that many PD programs fail due to their lack of contextual relevance. One-time workshops, often detached from classroom realities, have minimal long-term impact. Guskey (2002) emphasizes that professional development must be ongoing, practical, and connected to student learning outcomes to be effective. In developing countries, challenges include inadequate infrastructure, limited access to digital technologies, and policy inconsistencies. According to UNESCO (2016), many low-income nations struggle to provide continuous, structured professional learning opportunities. Furthermore, resistance to change, lack of motivation, and weak monitoring systems may impede the effectiveness of PD programs. Addressing these challenges requires systemic reform, including policy support, resource allocation, leadership commitment, and integration of school-based professional learning model

Conclusion

The literature consistently affirms that teacher education and professional development are central to improving educational quality. Grounded in theoretical perspectives such as reflective practice, constructivism, and transformative learning, effective teacher development programs promote continuous growth, collaboration, and instructional improvement. However, challenges related to implementation, sustainability, and contextual relevance must be addressed through comprehensive policy frameworks and institutional support. Strengthening teacher education systems is therefore essential for achieving long-term educational reform and National development goals.

COGNITIVE APPRENTICESHIP MODEL- AN EXPERIENTIAL STRATEGY FOR DAVANGERE HIGH SCHOOL STUDENT ACHIEVEMENT IN MATHEMATICS

Prof. M.C. Yarriswamy
Professor, Department of Education, Bengaluru University, mcyswamy@gmail.com
Murugeshi K
Research Scholar, Department of Education Kitturu Rani Channamma University Belagavi, -56, murugeshik6@gmail.com

Abstract

Education is a powerful instrument for individual and societal development, fostering the construction of new knowledge by integrating fresh experiences with prior understanding. Constructivism provides a theoretical framework for explaining how learners actively construct knowledge through interaction, experience, and collaboration, making it particularly relevant in the digital age where learning occurs within and across diverse networks. Cognitive apprenticeship extends these principles by enabling experts or teachers to model cognitive processes, provide scaffolding, and gradually transfer responsibility to learners, thereby helping them acquire both conceptual understanding and practical problem-solving skills. The present study employed an experimental approach using a pre-test–post-test non-equivalent group design to examine the effectiveness of the Cognitive Apprenticeship Model on students' achievement in Mathematics. The experimental group received instruction through the Cognitive Apprenticeship Model, while the control group was taught using the conventional activity-oriented method. The collected data were analyzed using the t-test, and the obtained t-value of 6.33 was found to be statistically significant. The findings indicate a significant improvement in the post-test achievement scores of students taught through the Cognitive Apprenticeship Model, demonstrating its effectiveness in enhancing Mathematics achievement among higher secondary school students.

Keywords: *Cognitive Apprenticeship Model, Experiential Strategy, Achievement in Mathematics*

1. Introduction:

Education is a transformative process that facilitates the holistic development of students by bringing about positive changes in their intellectual, emotional, social, and physical behaviour. Through education, teachers expose learners to relevant knowledge, concepts, values, and skills that enable them to understand the world and respond effectively to the challenges of everyday life.

2. Need and Significance of the Study:

The increasing complexity of the business and professional world demands that students acquire diverse knowledge, skills, and competencies through meaningful learning experiences. Traditional approaches to Mathematics instruction are often insufficient to provide learner-centred, activity-oriented, and contextually relevant educational experiences that foster higher-order thinking and problem-solving abilities. In this context, the cognitive apprenticeship approach has emerged as an effective instructional model for promoting deep understanding and authentic learning. Rooted in the principles of constructivism, cognitive

apprenticeship emphasizes learning through guided participation, observation, practice, and reflection in real-world contexts. Unlike the conventional teacher-centred approach, the learner-centred paradigm, championed by John Dewey in the early twentieth century, recognizes students as active participants in the construction of knowledge. Contemporary educational methods and instructional strategies have further strengthened this approach by making learning more engaging, experiential, and meaningful. Cognitive apprenticeship extends these principles by enabling experts or teachers to model cognitive processes, provide scaffolding, and gradually transfer responsibility to learners, thereby helping them acquire both conceptual understanding and practical problem-solving skills.

3. Cognitive apprenticeship model:

"Cognitive apprenticeship is a model of instruction that works to make the thinking visible". Cognitive apprenticeship model involves six components:

- Modeling:- Expert models the activity
- Coaching:- Encouraging the students as they try to complete tasks on their own
- Scaffolding:- Providing some materials to solve their difficulty
- Articulation:-Open the eyes of students to new way of thinking
- Reflection:-Enabling the students to compare their own problem solving process
- Exploration:-Pushing students in to a mode of problem solving on their own

A. Modeling:

Modeling is a fundamental process of learning that occurs continuously in everyday life. Individuals acquire many skills by observing and imitating the actions of others. Simple tasks, such as washing dishes, primarily involve physical actions and procedural skills, making them relatively easy to learn through direct observation and imitation. However, complex tasks that require higher-order cognitive processes are far more challenging to model because the underlying mental operations cannot be directly observed. For instance, when students watch a proficient mathematics learner solve a complex problem silently, they can observe only the written steps and final solution. They cannot see how the learner interprets the problem, selects appropriate strategies, applies mathematical principles, or evaluates alternative methods during the thinking process. Cognitive apprenticeship addresses this limitation by encouraging experts or teachers to make their thinking visible through techniques such as verbalizing their reasoning, demonstrating problem-solving strategies, and explaining the decision-making process. This enables learners to understand not only what to do but also why and how particular approaches are used, thereby promoting deeper conceptual understanding and effective problem-solving skills.

B. Coaching and scaffolding:

Coaching and scaffolding are essential components of the cognitive apprenticeship model that support learners in achieving instructional goals through guided assistance. Coaching is a comprehensive process in which the teacher or an expert facilitates learning by providing guidance, feedback, reminders, hints, encouragement, and continuous monitoring of learners' progress.

Scaffolding, considered a specific form of coaching, involves providing temporary support that enables learners to perform tasks beyond their current level of competence, with the support gradually withdrawn as they gain independence. This concept is grounded in Vygotsky's (1978) Zone of Proximal Development (ZPD), which emphasizes that learners achieve higher levels of understanding through guidance from teachers or more capable peers. Effective scaffolding includes shared learning goals, a whole-task approach, timely assistance, support aligned with learners' needs, an optimal level of guidance, and expert modeling.

c. Articulation and Reflection

Articulation and reflection are important elements of the cognitive apprenticeship model that promote deeper learning and metacognitive development. Articulation refers to the process by which learners express, explain, and demonstrate their knowledge, reasoning, and problem-solving strategies, making their thinking explicit through discussions, presentations, demonstrations, and written work. This enables teachers and peers to provide meaningful feedback and helps learners refine their understanding.

Reflection, on the other hand, involves critically examining one's learning experiences, performance, and outcomes to identify strengths, weaknesses, and areas for improvement. Through guided questioning, self-evaluation, and analysis of learning processes, learners develop greater self-awareness, critical thinking, and the ability to apply knowledge effectively in new situations. Together, articulation and reflection enhance conceptual understanding, foster independent learning, and strengthen higher-order cognitive skills.

D. Exploration:

Exploration is a key component of the cognitive apprenticeship model that promotes independent learning by gradually reducing teacher support and encouraging learners to apply their knowledge and skills autonomously. As coaching and scaffolding are faded, students actively investigate problems, formulate hypotheses, test strategies, and construct new knowledge through authentic learning experiences. Unlike passive learning, exploration involves guided inquiry in which teachers provide broad goals and appropriate guidance while allowing learners to identify problems, develop solutions, and make discoveries independently. This approach enables students to explore both real-world phenomena and problem-solving processes, thereby strengthening critical thinking, creativity, and decision-making skills. During exploration, teachers continue to provide support whenever necessary, encourage articulation and reflection, and gradually transfer responsibility to learners. Through activities such as projects, role-playing, simulations, and collaborative inquiry, students develop expert-like thinking, become self-directed learners, and gain the confidence to apply their knowledge in real-life situations.

4. Statement of the problem

In this study the researchers are trying to find out the effectiveness of cognitive apprenticeship model on achievement in Mathematics. Hence the study is entitled as "Cognitive Apprenticeship Model–An Experiential Strategy for Davangere High School students Achievement in Mathematics"

5. Objectives of the study:

Objective formulated for the present study includes:

1) To find out the effectiveness of Cognitive Apprenticeship model on achievement in Mathematics among High School Students.

2) To find out the effectiveness of Activity oriented method on achievement in Mathematics among High School Students.

3) To compare the extent of effectiveness of cognitive apprenticeship model with that of Traditional oriented method

4) To find out and compare the effectiveness of Cognitive Apprenticeship model and Traditional oriented method on Achievement in Mathematics with respect to the following domains

(i) Knowledge
(ii) Understanding
(iii)Application

6. Methodology:

The experimental method was found appropriate for the study

7. Population, Sample and Tool

The population consisted of High School Students of Davanagere city following the Karnataka state syllabus. Sample of the present study consists of 120 students of 9th standard in Bapuji nursery, higher primary and High School, Davangere. Tools used for the collection of data are the achievement test in Mathematics, lesson transcripts in Mathematics based on Cognitive Apprenticeship Model and Traditional Oriented Method

Statistical techniques used:

The following statistical techniques were uses

1) Arithmetic mean
2) Standard deviation
3) t-test
4) ANOVA

8. Analysis of data with respect to Achievement Test in Mathematics

In the present study the investigator compared the achievement of experimental and control group. For that the scores obtained in the Pre - test and Post-Test were analyzed:

1. Test of significance of difference between Mean Post-Test Scores of Experimental and Control Groups on Achievement in Mathematics

The investigator analyzed the data to examine the effectiveness of Cognitive Apprenticeship model on the achievement in Mathematics. The test of significance between the mean Post-Test scores of Experimental and Control Groups are given in Table 1.

Table 1: Test of significance of difference between Mean Post-Test Scores of Experimental and Control Groups on Achievement in Mathematics

Group	umber	Mean	tandard Deviation	-value	Level of Significance
Experimental	60	25.93	1.59	7.83	P <0.01
Control	60	22.33	3.23		

From the Table 1, it is evident that the t-test is 7.83 is significant at 0.01 level. Table value for t-test at 0.05 and 0.01 level are 1.96 and 2.58 respectively. This shows that the two groups differ significantly with respect to the Post-Test Achievement test score in Mathematics.

2. Comparison of Experimental and Control Groups on achievement in Mathematics as a whole based on Pre-Test and Post-Test scores:

The investigator compared the achievement in Mathematics of two groups on the basis of Pre - test and post-test scores. Here the experimental group was taught through Cognitive Apprenticeship model and Control Group taught using Traditional Oriented method of teaching. The scores obtained by administering the achievement test in Mathematics, before and after the experiment was subjected to test using one tailed test. The details of analysis are given in Table 2.

Table 2: Comparison of Experimental and Control Groups on achievement in Mathematics as a whole based on Pre-Test and Post-Test scores

Test	Group	Number	Mean	SD	T-value	Level of Significance
Pre-test	Experimental	60	19.03	3.60	1.79	P>0.05
	Control	60	17.63	3.59		
Post-Test	Experimental	60	25.93	1.59	6.33	P<0.01
	Control					

From Table 2, the t-test obtained for Pre - test is 1.79 which is not significant at 0.01 level. This shows that, there is not a significant difference in achievement in Mathematics of Experimental and Control Group. For Post-Test the t-test obtained is 6.33.This shows that there is significant difference between the experimental and control group with regard to their achievement in Mathematics for Post-Test. The mean Post-Test score of the Experimental group is significantly higher than that of the control group. So it is possible to say that after treatment, the experimental group achieved more than control group. Thus, it can be inferred that the Cognitive Apprenticeship Model helped the Experimental group to achieve better than the control group. So it can be concluded that Cognitive Apprenticeship is more effective than Traditional Oriented Method of Teaching.

3. Comparison of Achievement in Mathematics of Experimental and Control Group under three domains-knowledge, understanding and application:

The investigator attempted to compare the achievement in Mathematics of the Experimental Group and Control groups under different domains -knowledge, understanding and

application. Pre - test and Post-Test scores for the separate items are compared for Experimental and Control Groups to find the significance in the mean difference.

Table 3: Comparison of Achievement in Mathematics of Experimental and Control Groups on the Pre - test and Post-Test Scores under Knowledge Domain

Test	Group	Number	Mean	SD	**T-value**	of Significance
Pre - test	Experimental	60	2.45	0.93	1.25	p>0.05
	Control	60	2.2	0.88		
Post-Test	Experimental	60	5.5	1.18	2.39	P<0.01
	Control					

From Table 3 t-test obtained for Pre - test is 1.25 which is not significant at 0.05 level from this result we can understand that two groups differ in their academic ability of knowledge level in the Pre - test. The t-test of Post-Test obtained is 2.39 which is not significant at 0.05 level. From this result we can understand that two groups do not differ significantly in their academic ability at knowledge level in the Post-Test.

Table-4: Comparison of Achievement in Mathematics of Experimental and Control Groups on the Pre - test and Post-Test Scores under Understanding Domain

Test	**Group**	**Number**	**Mean**	**SD**	**T-VALUE**	**Level of Significance**
Pre - test	Experimental	60	10.15	2.06	3.22	p>0.05
	Control	60	8.7	1.89		
Post-Test	Experimental	60	15.35	2.87	3.36	P<0.01
	Control					

From Table -4, the t-test obtained for Pre - test is 3.22, which is significant at 0.05 level. From this result we can understand that two groups differ significantly in their academic ability at understanding level in the Pre - test. The t-test obtained for Post Test is 3.36, which is significant at 0.01 level and 0.05 level. From this result we can understand that two groups differ significantly in their academic ability at understanding level in the Post-Test

Since the mean score of Experimental group is greater than the Control Group for the Post-Test, The Experimental Group is superior to Control Group in Mathematics Achievement at understanding level. Hence it can be concluded that the performance of the Experimental Group taught through Cognitive Apprenticeship Model is better than that of Control Group taught through Traditional Oriented Method with regard to Achievement in Mathematics under the understanding domain.

Table 5: Comparison of Achievement in Mathematics of Experimental and Control Groups on the Pre - test and Post-Test Scores under Application Domain

Test	Group	Number	Mean	SD	CR	evel of Significance
Pre - test	Experimental	60	1.88	1.04		
	Control	60	1.5	0.72	1.9	p>0.05
Post-Test	Experimental	60	5.08	1.20		
	Control				2.48	p<0.01

From Table 5, the t-test obtained for Pre - test is 1.9, which is not significant at 0.05 level. From this result we can understand that two groups do not differ significantly in their academic ability at application level in the Pre - test. The t-test obtained for Post-Test is 2.48, which is significant at 0.05 level. From this result we can understand that two groups differ significantly in their academic ability at application level in the Post-Test.Since the mean score of Experimental Group is greater than the Control Group for the Post-Test, Experimental Group is superior to Control Group in Mathematics Achievement at application level. Hence it can be concluded that the performance of the Experimental Group taught through Cognitive Apprenticeship Model is better than that of control Group taught through Activity Oriented Method with regard to achievement in Mathematics under the application domain

9. Major finding

The comparison of t-test shown that there is a significant difference in achievement of students in Mathematics

10. Conclusion

As education is an unremitting process, the process of making educational practices is also vibrant. Educational practitioners are trying to refine the instructional system more effective and interesting. The achievement in Mathematics of Higher Secondary level students taught through Cognitive Apprenticeship is higher than the Activity Oriented Method with respect to the domains such as knowledge, understanding and application. Achievement in Mathematics of students at Higher Secondary Level taught through Cognitive Apprenticeship is more effective than Activity Oriented Method. Cognitive apprenticeship model provides the efficient way of imbibing knowledge in children. \

ATTITUDES OF UNIVERSITY TEACHERS OF KARNATAKA TOWARDS EMERGING TECHNOLOGIES (AR/VR, IoT AND ROBOTICS) IN EDUCATION

Prof. Ratan Chavan
Professor, Navodaya College of Education, Raichur (Karnataka)
Email.: rathan.chavan@gmail.com

Abstract

Emerging technologies are increasingly reshaping the teaching and learning processes in higher education. Technologies such as Augmented Reality (AR), Virtual Reality (VR), the Internet of Things (IoT), and Robotics offer significant opportunities for immersive learning, real-time data collection, simulation, automation, personalized instruction, and experiential learning. However, the effective adoption and integration of these technologies largely depend on university teachers' attitudes, technological readiness, digital competence, and professional capabilities. In this context, the present study was undertaken to examine the attitudes of university teachers in Karnataka towards emerging technologies, with particular emphasis on AR/VR, IoT, and Robotics in education. A descriptive survey method was adopted, and a sample of 400 university teachers from selected universities and higher education institutions of Karnataka was proposed for the study. For data collection, the investigator developed an Attitude towards Emerging Technologies in Education Scale (AETES) based on a five-point Likert scale. The scale covered major dimensions such as perceived usefulness, ease of use, pedagogical value, and application of AR/VR, IoT and Robotics in education, technological readiness, perceived challenges, and future readiness. The collected data were analysed using Mean, Standard Deviation, independent-samples t-test, one-way ANOVA, and Pearson's product-moment correlation. The illustrative findings suggest that university teachers generally have a favourable attitude towards emerging technologies in education. Significant differences were observed across selected demographic variables, and technological readiness was found to have a positive relationship with favourable attitudes towards emerging technologies. The study emphasizes the need for systematic faculty development programmes, adequate technological infrastructure, institutional support, and appropriate policies to facilitate the effective, meaningful, and responsible integration of AR/VR, IoT, and Robotics into higher education.

Keywords: *Emerging Technologies, Augmented Reality, Virtual Reality, Internet of Things, Robotics,*

1. Introduction:

Technology has become an essential part of contemporary higher education, significantly influencing the processes of teaching, learning, research, and institutional management. The rapid advancement of digital technologies has transformed the ways in which knowledge is generated, shared, communicated, and accessed by teachers and learners. Universities are increasingly adopting innovative technological solutions to create interactive learning environments, improve educational experiences, and enhance institutional effectiveness. Among the emerging technologies gaining considerable attention in higher education are

Augmented Reality (AR), Virtual Reality (VR), the Internet of Things (IoT), and Robotics. These technologies offer new possibilities for immersive learning, experiential education, automation, personalized instruction, real-time data management, and the development of technology-enabled educational environments.

Technology has become an essential part of contemporary higher education, significantly influencing the processes of teaching, learning, research, and institutional management. The rapid advancement of digital technologies has transformed the ways in which knowledge is generated, shared, communicated, and accessed by teachers and learners. Universities are increasingly adopting innovative technological solutions to create interactive learning environments, improve educational experiences, and enhance institutional effectiveness. Among the emerging technologies gaining considerable attention in higher education are Augmented Reality (AR), Virtual Reality (VR), the Internet of Things (IoT), and Robotics. These technologies offer new possibilities for immersive learning, experiential education, automation, personalized instruction, real-time data management, and the development of technology-enabled educational environments.

The Internet of Things refers to interconnected physical devices equipped with sensors, software and communication capabilities that enable them to collect and exchange data. In higher education, IoT can support smart classrooms, attendance systems, environmental monitoring, laboratory management, campus security and real-time learning analytics.

Robotics is another emerging technology with significant educational potential. Educational robots can support programming, engineering, STEM education, problem-solving and collaborative learning. Robots may also be used for simulation, laboratory activities and specialized instructional applications.

Although these technologies offer substantial educational opportunities, their successful implementation cannot be achieved merely by providing technological infrastructure. Teachers are central to the process of technology integration. Their attitudes, beliefs, confidence, knowledge and willingness to experiment with new technologies strongly influence the extent to which emerging technologies are incorporated into classroom practices.

University teachers may perceive emerging technologies as opportunities for innovation, improved student engagement and personalized learning. At the same time, they may have concerns regarding cost, technical complexity, lack of training, infrastructure, privacy, cybersecurity, accessibility and potential disruption of established teaching practices.

Therefore, understanding university teachers' attitudes towards AR/VR, IoT and Robotics is important for developing effective technology integration strategies in higher education. The present study attempts to examine these attitudes among university teachers of Karnataka.

2. Need and Significance of the Study:

The study is significant because emerging technologies are becoming increasingly relevant to higher education. The findings may help universities understand the preparedness and attitudes of teachers towards technological innovations.

The study is important for the following reasons:

1) It provides information about university teachers' attitudes towards AR/VR, IoT and Robotics.
2) It helps identify the perceived educational usefulness of emerging technologies.
3) It identifies possible technological and institutional barriers.
4) It provides evidence for planning faculty development programmes.
5) It may assist universities in developing technology integration policies.
6) It highlights the need for infrastructure and technical support.
7) It may contribute to curriculum modernization in higher education.
8) It provides a basis for further research on emerging technologies in Indian higher education.

3. Statement of the Problem:

"ATTITUDES OF UNIVERSITY TEACHERS OF KARNATAKA TOWARDS EMERGING TECHNOLOGIES (AR/VR, IOT AND ROBOTICS) IN EDUCATION."

4. Objectives of the Study:

The study was undertaken with the following objectives:

1) To study the attitudes of university teachers of Karnataka towards emerging technologies in education.
2) To study university teachers' attitudes towards Augmented Reality and Virtual Reality in education.
3) To study university teachers' attitudes towards the use of IoT in education.
4) To study university teachers' attitudes towards Robotics in education.
5) To examine whether there is a significant difference in attitudes towards emerging technologies with respect to gender.
6) To examine whether there is a significant difference in attitudes towards emerging technologies with respect to teaching experience.
7) To examine whether there is a significant difference in attitudes towards emerging technologies with respect to academic discipline.
8) To study the relationship between technological readiness and attitudes towards emerging technologies.
9) To identify the major perceived challenges associated with the adoption of emerging technologies in higher education.

5. Hypotheses of the Study:

The following null hypotheses were formulated:

1) H01: There is no significant difference between male and female university teachers in their attitudes towards emerging technologies in education.

2) H02:There is no significant difference among university teachers with different levels of teaching experience in their attitudes towards emerging technologies.

3) H03:There is no significant difference among university teachers belonging to different academic disciplines in their attitudes towards emerging technologies.

4) H04:There is no significant relationship between technological readiness and attitudes towards emerging technologies.

6. Variables of the Study

Background Variables

1) Gender
2) Teaching Experience
3) Academic Discipline

Major Variable:

The emerging technologies considered in the present study are:

1) Augmented Reality (AR)
2) Virtual Reality (VR)
3) Internet of Things (IoT)
4) Robotics

7. Operational Definitions:

1) Emerging Technologies: Emerging technologies refer to developing or rapidly evolving digital technologies that have the potential to transform educational practices. In the present study, the term specifically refers to AR, VR, IoT and Robotics.

2) Augmented Reality: Augmented Reality refers to technology that overlays computer-generated information, images or objects onto the user's real-world environment.

3) **Virtual Reality:**Virtual Reality refers to a computer-generated immersive environment that enables users to interact with simulated objects and situations.

4) **Internet of Things**: IoT refers to interconnected physical devices equipped with sensors, software and communication capabilities that collect and exchange data.

5) **Robotics**:Robotics refers to the design, development and application of programmable machines or robots to perform educational, instructional or support functions.

6) **Attitude**:Attitude refers to the favourable or unfavourable feelings, beliefs and behavioural tendencies of university teachers towards the use of emerging technologies in education.

8. Methodology:

8.1 Research Method:

The descriptive survey method was adopted for the present investigation.

8.2 Research Design:

A normative survey research design was used to collect information regarding university teachers' attitudes towards AR/VR, IoT and Robotics.

8.3 Population:

The population comprised university teachers working in universities and higher education institutions located in Karnataka.

8.4 Sample:

A sample of 400 university teachers was proposed for the study. Sample Distribution is as follows:

Variable	Category	N
Gender	Male	230
	Female	170
Experience	Below 10 years	145
	10–20 years	155
	Above 20 years	100
Discipline	Science/Technology	140
	Social Sciences/Humanities	140
	Professional/Other Disciplines	120

The distribution is illustrative and should be replaced with the actual sample distribution.

8.5 Tool Used for Data Collection: For the present study, an Attitude towards Emerging Technologies in Education Scale (AETES) may be developed by the investigator to assess the attitudes of university teachers towards emerging technologies such as Augmented Reality/Virtual Reality (AR/VR), Internet of Things (IoT), and Robotics in education. The scale may include statements covering important dimensions such as awareness of emerging technologies, perceived usefulness, ease of use, application of AR/VR in teaching and learning, use of IoT in education, application of robotics in education, student engagement and learning, technological readiness, institutional support, perceived challenges, ethical and privacy concerns, and future readiness. A five-point Likert response format may be adopted, consisting of Strongly Agree (5), Agree (4), Undecided (3), Disagree (2), and Strongly Disagree (1). Negatively worded statements may be scored in reverse order. Thus, a higher total score would indicate a more favourable attitude towards emerging technologies in education. Before final administration, the scale should be subjected to expert validation, pilot testing, item analysis, and reliability analysis to establish its suitability for data collection.

Standardization of the Tool: The Attitude towards Emerging Technologies in Education Scale (AETES) may be standardized systematically to ensure its validity, reliability, and suitability for assessing university teachers' attitudes. The standardization process may begin with an extensive review of literature and collection of relevant materials related to emerging technologies and their applications in education. Based on the review, the major dimensions of emerging technologies may be identified and an initial pool of statements may be prepared. The preliminary tool may then be submitted to subject experts for their suggestions regarding the relevance, clarity, appropriateness, and coverage of the statements. Necessary modifications may be made based on expert opinions, followed by pilot administration of the revised tool to a suitable sample. The responses obtained during the pilot study may be subjected to item analysis, and unsuitable, ambiguous, or weak items may be eliminated or modified. Subsequently, appropriate evidence of validity and reliability may be established through suitable statistical procedures. After incorporating the findings of the pilot study and item analysis, the final version of the AETES may be prepared along with appropriate scoring and interpretation procedures. For the final journal manuscript, the actual number of items, validity coefficients, reliability coefficient, item-analysis results, and pilot-study findings should be reported based on the empirical evidence obtained during the standardization

process.

8.6 Data Collection Procedure:

The researcher contacted selected university teachers from different higher education institutions in Karnataka. The purpose of the investigation was explained to the respondents. The AETES was administered personally and/or through an online survey platform. Respondents were requested to provide their responses honestly. The collected questionnaires were checked, coded and tabulated for statistical analysis.

8.7 Statistical Techniques Used:

The collected data were analysed using appropriate statistical techniques. Mean and Standard Deviation were used to describe the overall attitudes of university teachers. An independent-samples t-test was used to determine significant differences between two groups, particularly with respect to gender. One-way ANOVA was used to examine differences among three or more groups, such as teaching-experience or academic-discipline groups. Pearson's Product-Moment Correlation was used to determine the relationship between technological readiness and attitudes towards emerging technologies. The level of significance was fixed at **0.05**.

9. Analysis and Interpretation based on Hypotheses:

1) H01: There is no significant difference between male and female university teachers in their attitudes towards emerging technologies in education.

Table – 1: t-test of Attitudes towards Emerging Technologies by Gender

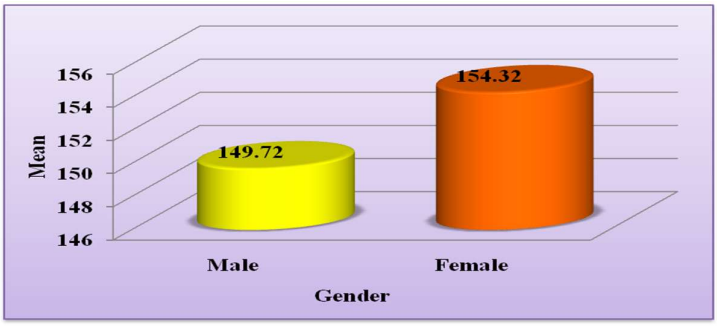
Gender	N	Mean	SD	t-value
Male	230	149.72	16.31	2.34*
Female	170	154.32	16.39	

***df = 398; Significant at 0.05 level**

Interpretation:

The obtained t-value of 2.34 is greater than the critical t-value of approximately 1.96 at the 0.05 level. Therefore, the null hypothesis is rejected. The result indicates a significant difference between male and female university teachers in their attitudes towards emerging technologies. In the illustrative data, female teachers obtained a higher mean attitude score.

Graph – 2: Comparison of Score of Attitudes towards Emerging Technologies by Gender



2) **H02: There is no significant difference among university teachers with different levels of teaching experience in their attitudes towards emerging technologies:**

Table – 3: One-Way ANOVA of Attitudes towards Emerging Technologies by Teaching Experience

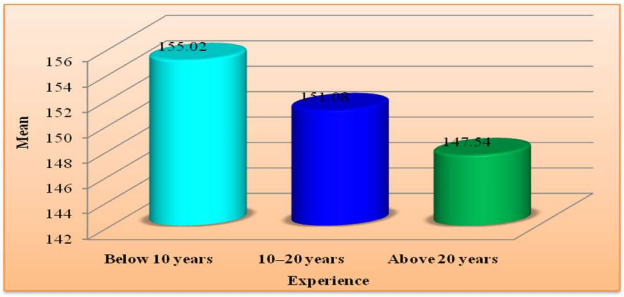
Experience	N	Mean	Source	SS	df	MS	F
Below 10 years	145	155.02	Between Groups	2,846.37	2	1,423.19	5.18*
10–20 years	155	151.08	Within Groups	109,089.63	397	274.72	
Above 20 years	100	147.54	Total	111,936.00	399		

***significant at 0.05 level**

Interpretation:

The obtained F-value of 5.18 is significant at the 0.05 level. Therefore, the null hypothesis is rejected. The result indicates that university teachers with different levels of teaching experience differ significantly in their attitudes towards emerging technologies.The highest mean attitude score was obtained by teachers with less than 10 years of experience. A post-hoc test should be applied to actual data to determine which specific groups differ significantly.

Graph – 3: Comparison of Scores of Attitudes towards Emerging Technologies by Teaching Experience



3) **H03: There is no significant difference among university teachers belonging to different academic disciplines in their attitudes towards emerging technologies.:**

Table – 4: One-Way ANOVA of Attitudes by Academic Discipline

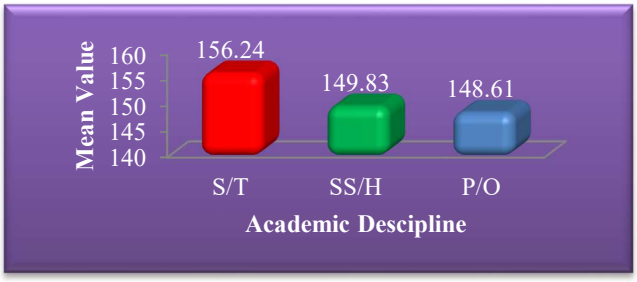
Academic Discipline	N	Mean	Source	SS	df	MS	F
Science/Technology	140	156.24	Between Groups	3,167.25	2	1,583.63	5.83*
Social Sciences/Humanities	140	149.83	Within Groups	107,768.75	397	271.45	
Professional/Other	120	148.61	Total	110,936.00	399		

***Significant at 0.05 level**

Interpretation:

The obtained F-value of 5.83 is significant at the 0.05 level. Therefore, a significant difference exists among university teachers belonging to different academic disciplines. Teachers from Science and Technology disciplines demonstrated comparatively more favourable attitudes towards emerging technologies.

Graph-4: Comparison of mean value of university teachers belonging to different academic disciplines



4) H04: There is no significant relationship between technological readiness and attitudes towards emerging technologies.:

Table – 5: Correlation between Technological Readiness and Attitudes

Variables	N	R-value	Significance
Technological Readiness and Attitude towards Emerging Technologies	400	0.64**	Significant

Interpretation:

The obtained correlation coefficient of r = 0.64 indicates a positive and significant relationship between technological readiness and attitude towards emerging technologies. This suggests that university teachers with greater technological readiness tend to demonstrate more favourable attitudes towards AR/VR, IoT and Robotics.

5) The overall attitudes towards emerging technologies:

Table – 6: Mean and Standard Deviation of Attitudes towards Emerging Technologies

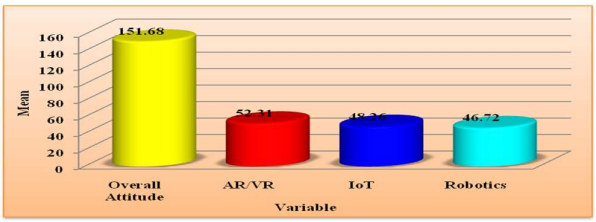
Variable	N	Mean	SD
Overall Attitude	400	151.68	16.42
AR/VR	400	52.31	6.84
IoT	400	48.26	6.12
Robotics	400	46.72	6.08

Interpretation:

The illustrative findings indicate that university teachers generally have a favourable attitude towards emerging technologies. Among the three technology areas, AR/VR obtained the highest mean score, followed by IoT and Robotics. This suggests that teachers may perceive immersive technologies such as AR and VR as particularly useful for improving student

engagement and experiential learning.

Graph – 3: Comparison of theMean and Standard Deviation of Attitudes towards Emerging Technologies



10. **Major Findings:** The major findings of the study are:

1) University teachers generally possess a favourable attitude towards emerging technologies in education.

2) AR/VR received a relatively favourable response among university teachers.

3) Teachers also showed positive attitudes towards IoT-based educational applications.

4) Robotics was perceived as a useful emerging technology, particularly for STEM and experiential learning.

5) A significant gender difference was observed in attitudes towards emerging technologies.

6) Significant differences were found among teachers with different levels of teaching experience.

7) Significant differences were observed among teachers from different academic disciplines.

8) Science and Technology teachers demonstrated relatively more favourable attitudes towards emerging technologies.

9) Technological readiness was positively and significantly related to attitudes towards emerging technologies.

10) The findings emphasize the importance of teacher preparedness for successful technology integration.

11. **Discussion:** The findings suggest that university teachers recognize the educational potential of emerging technologies. AR and VR can provide immersive and experiential learning opportunities that are difficult to achieve through conventional teaching methods. For example, students can explore virtual laboratories, historical environments, scientific models and professional simulations without requiring physical access to expensive facilities. IoT can contribute to smart educational environments through connected devices, sensors and real-time data. Universities may use IoT for smart classrooms, laboratory monitoring, campus management and learning analytics. Teachers' positive attitudes towards IoT can facilitate its integration into academic and administrative processes. Robotics has particular relevance to STEM education, engineering, computer science and skill-based learning. Robots can facilitate programming, experimentation, problem-solving and collaborative learning. The relationship between technological readiness and attitude suggests that confidence and competence with technology are important factors in successful adoption. Teachers who possess adequate knowledge, skills and institutional support may be more

willing to experiment with emerging technologies. However, technology adoption should not be viewed solely from a technical perspective. Ethical issues including privacy, cybersecurity, surveillance, accessibility, digital inequality and responsible data use must also be considered. Therefore, universities should promote responsible and human-centred technology integration.

12. **Educational Implications:** The findings have important implications for higher education.

1) Faculty Development: Universities should organize regular Faculty Development Programmes on:

- AR/VR applications
- IoT-enabled classrooms
- Educational Robotics
- Immersive learning
- Simulation-based teaching
- Digital assessment
- Emerging technology ethics

2) Infrastructure Development: Universities should provide appropriate infrastructure including:

- VR headsets
- AR-enabled devices
- Sensors
- IoT kits
- Educational robots
- High-speed internet
- Smart classrooms
- Simulation platforms

3) **Curriculum Development:** Emerging technologies should be integrated into university curricula wherever academically appropriate. Teacher education programmes should also prepare future teachers to use AR/VR, IoT and Robotics.

4) **Institutional Support:** Teachers require technical support, training, access to resources and sufficient time to experiment with new technologies.

5) Ethical Technology Use: Universities should develop policies concerning privacy, cybersecurity, accessibility, intellectual property and responsible use of emerging technologies.

13. Recommendations

Based on the findings, the following recommendations are made:

1) Universities should establish Emerging Technology Centres or Innovation Labs.

2) Regular training programmes should be organized for university teachers.

3) AR/VR laboratories should be developed in disciplines where immersive learning is useful.

4) IoT-based smart classroom and laboratory facilities should be promoted.
5) Robotics laboratories should be established, particularly in STEM-related disciplines.
6) Teachers should be encouraged to undertake action research on emerging technologies.
7) Universities should provide technical support for teachers.
8) Technology integration should be linked with pedagogical objectives rather than technology adoption alone.
9) Ethical guidelines should be developed for emerging technology use.
10) Further studies should examine students' attitudes towards AR/VR, IoT and Robotics.
11) Comparative studies may be conducted between government and private universities.
12) Future research may examine the relationship between technological competence, attitude and actual technology adoption.

14. Limitations of the Study:

The study has the following limitations:
1) The study is limited to university teachers in Karnataka.
2) The proposed sample consists of 400 teachers.
3) The study focuses specifically on AR/VR, IoT and Robotics.
4) Data are primarily based on self-reported responses.
5) Actual classroom implementation of emerging technologies was not directly observed.
6) Variables such as age, educational qualification, digital literacy, institutional type and access to infrastructure may also influence attitudes but were not considered in detail.

15. **Conclusion:** Emerging technologies such as Augmented Reality, Virtual Reality, Internet of Things and Robotics have considerable potential to transform higher education. They can facilitate immersive learning, experiential learning, real-time data collection, simulation, personalized instruction and innovative assessment. The present study indicates that university teachers of Karnataka generally demonstrate favourable attitudes towards emerging technologies. Differences according to gender, teaching experience and academic discipline suggest that technology adoption is influenced by individual and professional characteristics. The positive relationship between technological readiness and attitude further indicates that teachers need adequate knowledge, skills, confidence and institutional support to effectively integrate emerging technologies. The successful adoption of AR/VR, IoT and Robotics should therefore be approached as a combination of technology, pedagogy, professional development, infrastructure and ethical responsibility. Universities in Karnataka can play a significant role in preparing teachers and students for an increasingly technology-enabled educational environment.

AI-ENABLED COGNITIVE SUPPORT TOOLS FOR MANAGING STRESS DURING THE SCHOOL-TO-COLLEGE TRANSITION: EXAMINING THE ROLE OF POSITIVE AND NEGATIVE THINKING PATTERNS

Gatike Rambabu
Ph.D. Research Scholar, Institute of Advanced Study in Education, Saidapet, Chennai – 15
Dr. R. Sahaya Mary
Ph.D. Supervisor, Associate Professor, Institute of Advanced Study in Education, Saidapet, Chennai – 15

Abstract

Transition from secondary to post-secondary studies can be called one of the most difficult periods in a student's life. Factors like new and unexpected academic demands, lack of supportive structures, and changes in social identity often trigger additional stress. Research based on Cognitive Behaviour Therapy shows that the intensity of stress experienced by students during this transition is not so much dependent on the transition itself but rather on its interpretation and response to it by the student in question. Those students who constantly have negative automatic thoughts, such as exaggeration of academic setbacks, or generalization of initial difficulties as a proof of total failure usually report higher levels of anxiety, avoidance behavior and lower engagement in learning process. On the other hand, students who have learned to think in more balanced and realistic way demonstrate better coping skills, resilience and adjustment to the situation. This paper examines how positive and negative thinking patterns affect stress during the school-to-college transition. It is based on two cognitive models: It takes from two well-known cognitive behavioral approaches developed by Aaron Beck and Albert Ellis. Moreover, the study will highlight the potential of AI technologies to assist students in their psychological adaptation. The necessity for this issue arises from the relatively small number of counselors against a large number of students in most colleges. In addition, the study will discuss three kinds of AI technologies. These include chatbots to assist in reframing the negative thinking of the students, applications to monitor the emotions and sentiment of the student, and predictive learning analytics systems to identify potential dropouts. Lastly, the ethical concerns encountered because of using these technologies are considered in the paper.

Keywords*: school-to-college transition, cognitive patterns, stress, artificial intelligence, student well-being, cognitive behaviour therapy.*

Introduction

Transitioning from high school to college may not be always an easy process for everyone. In most cases, this transition marks the end of a number of years of developing routines and identity, along with other factors that have been established through the years of studying. Freshmen have to cope with a number of changes all at once: greater academic pressure,

larger classrooms, new peers, and sometimes relocation to another city or living without their family. Stress is a natural part of this experience but if it is prolonged or not handled correctly, it may damage student's progress. An increasing number of studies in psychology indicate that the level of distress that occurs during this period has little to do with the actual difficulty of adapting to the new surroundings and much more to do with how the students perceive the process of change. Two different students who experience the same decline in their performance in the first semester could react completely differently: one will see it as an indicator of his own incompetence, whereas the other one will interpret it as a short-lived and easily correctable mistake. However, at the same time, there is also a structural drawback in terms of how universities are able to attend to the well-being of their students, because in most cases the number of counsellors per student is quite low, especially for universities from developing countries. It means that there is a mismatch between the level of psychological problems that students might have at certain stages of their studies, like the beginning of the first semester, and the ability of university to react to them individually. AI has started to become a possible way out of this situation, providing scalable, constant and reliable way of support. This paper will discuss the interaction between these two topics: thinking patterns and stress and use of AI in college.

Theoretical Framework

The present study is based on two theories of cognitive-behavioural perspectives to highlight the effect of thought process on stress. According to the cognitive perspective of Aaron Beck, those people who are facing psychological stress tend to think in an automatic negative way regarding themselves, their situation, and their future, which is known as the cognitive triad. In terms of a college setting, a freshman suffering from stress will think automatically that "I am not able to make it here." Another approach that can explain why some students become psychologically distressed is the Rational Emotive Behaviour Therapy by Albert Ellis, and his ABC approach: An Activating event (like getting low grades or not being able to make friends) goes through the filter of a Belief (which is the meaning a student gives to the event), resulting in a Consequence both emotionally and behaviorally. Ellis maintained that psychological problems are mainly caused by irrational and/or distorted beliefs and not by events per se. In combination, these theories give rise to a useful perspective on transition stress, which can be viewed not as an unavoidable consequence of going through a tough experience in life, but rather as an interpretation process, which, in theory, can be recognized and adjusted. This approach is significant since it makes the process of intervention possible, regardless of whether it is being carried out by a human counselor or even AI-based technology as proposed in this paper.

Positive and Negative Thinking Patterns During Transition

There are some kinds of cognitive distortions that occur during this transition time at an especially high rate. Table 1 describes the most common distortions along with the positive way of looking at these events, which Cognitive Behavioral Therapy strives to foster.

Cognitive Distortion	Typical Automatic Thought	Balanced Alternative Thought
All-or-nothing thinking	"I failed one test, so I am a failure."	"I did poorly this time; one result does not define me."
Overgeneralization	"I struggled in this subject, so I am bad at everything."	"I am finding this subject difficult; other areas may still be fine."
Catastrophizing	"A slow start means I will fail the whole year."	"A slow start is common; I can adjust my study plan."
Mind reading	"Everyone thinks I don't belong here."	"I don't actually know what others think; I can wait and observe."
Personalization	"My roommate is quiet because of something I did."	"There could be many reasons; it may not be about me."

Table 1. Common Cognitive Distortions during the School-to-College Transition

Students who are used to engaging in such distortions usually display avoidance behaviors in the form of absence from classes, withdrawal from social situations, or withdrawal from support systems for fear that it would prove their negative self-assessment. This avoidance serves to reinforce the initial distortion, creating a vicious circle.

Conversely, students with balanced thinking patterns see the same set-backs as particular, temporary, and manageable, which promotes problem solving behavior over avoidance. The balanced thinking pattern is not a form of irrational optimism since it does not disregard the reality of difficulties but looks at the difficulties in such a manner that will enable positive action. In any support system, whether human or technological, it is important for it to assist students in examining and restructuring their automatic thoughts causing them stress.

Role of Artificial Intelligence in Supporting Cognitive Adjustment

There are several types of tools based on AI that are useful for helping individuals think healthily while in the transition phase, each one catering to a certain part of the stress cycle discussed above. Table 2 below shows some examples of these categories, the role they play, and their application example.

AI Tool Category	Core Function	Illustrative Use Case
Chatbot-based cognitive reframing assistant	Guides the student through a simplified thought-record dialogue	An apprehensive student about taking an examination identifies the automatic thought, evaluates the evidence and makes an alternate judgment
Sentiment and mood-tracking application	Logs daily emotional check-ins and detects trends over time	A prolonged period of mood downturn following a certain class raises the need for an easy-going evaluation
Predictive learning-analytics system	Uses attendance and engagement data to flag disengagement risk	A student who fails to submit assignments is detected and reported before being withdrawn

Table 2. AI-Enabled Tools Supporting Cognitive Adjustment during Transition

These categorizations are not just theoretical. The Woebot program developed by Fitzpatrick et al. (2017) has been able to prove that a chatbot providing conversations like those seen during CBT can have significant success in lowering the levels of anxiety and depression experienced by young adults. This provides evidence of the feasibility of such a concept in regards to the reframing assistant mentioned earlier. This paper uses that reasoning but applies it to the cognitive issues related to transitioning from school to college.

If combined, however, these tools will not serve as substitutes for the intuition, empathy, and professional education of human counsellors. On the contrary, they allow the institution's efforts to permeate the continuous process experienced by students, influencing them at the point when the very processes of mental pattern creation mentioned above take place in an almost imperceptible way. It allows for the distribution of counselling resources to people who need them the most, instead of depending on students themselves to recognize their needs and reach out for assistance. The scalability also has an element of equity associated with it since students who have issues accessing counseling on account of various socio-economic barriers such as first-generation students, rural students, and those who are embarrassed about accessing mental health services might find the tool easier to access in terms of the initial step.

Ethical Considerations

Incorporating AI in the provision of mental health care among students presents some of the concerns that organizations need to consider in their implementation. The privacy of the data is of utmost importance since the data pertaining to moods, stress, and academic study data are highly private for the students, therefore, it is necessary that they be told how their private data would be gathered, used, viewed, and stored. Moreover, there is always a threat of over-reliance on the automated systems in the situations when some of the students might treat the software as an equivalent of professional counseling services, which might be dangerous especially if there are situations of severe distress. Algorithmic bias is another issue, which has to be addressed by any organization implementing AI, as the prediction models based on the inadequate amount of data might result in inappropriate identification of the distressed students who do not conform to behavioral patterns known to the system. That is why the implementation of the AI in the field of mental health has to be supplemented with human guidance and clear understanding of the limits of the system.

Discussion

From all of the evidence and theory presented above, it becomes apparent that the process of transition from school to college is better viewed as a process in which pre-existing and developing thinking patterns play an important role. The destinies of two students who experience the same problems during this process may diverge dramatically depending mainly on their interpretation of these problems. This conclusion has its practical meaning as well. Orientation courses, freshman seminars and programs of peer mentoring may include some elements of cognitive awareness, helping freshmen identify common patterns of distorted thinking such as catastrophizing and overgeneralization. Incorporating these approaches early on, before students have experienced their first big failure, might make it easier for them to use their awareness when they need to do so. AI-based technologies incorporated in these

approaches would be a good supplement, especially for the purpose of finding out the students that are struggling without anyone knowing about it, and will ask for help only when their situation worsens dramatically. It is obvious that with these technologies being able to monitor constantly and throughout all the students at once, they are able to pick up some signals that even a small counselling team would be unable to pick up on. It seems like the best approach is to combine technologies and human work together.

Conclusion

The move from high school to college requires much effort on the part of students, and it is not how these obstacles will be interpreted by students that mostly affects their stress levels. Two individuals may find themselves in almost the same situation but end up being totally different because of the interpretation of events that occurs. Using the cognitive-behavioural model described by Beck and Ellis, this paper discussed that negative automatic thoughts and cognitive distortion increase stress associated with this stage, whereas balanced and realistic thinking contribute to better adjustment. Artificial Intelligence provides an efficient solution to support the mentioned cognitive processes during the transition in terms of reframing using chatbots, tracking emotions through apps and predicting learning needs through analytical approaches. It should be noted that in spite of the shortage of counselling services which makes it impossible to reach all those students who require assistance, such solutions can help. Nonetheless, issues related to privacy, bias, and a reduction in professional judgment, associated with AI-powered psychological tests, need to be carefully considered prior to implementation. Thus, the best strategy to ensure mental well-being of students during this transition would be a combination of AI-powered early intervention and accessible human counselling.

Abstract

The present study aimed to examine the relationship between Artificial Intelligence Literacy and Student Engagement among college students. The study adopted the Descriptive Survey Method, with a sample of 304 college students selected from various colleges of education using the Simple Random Sampling Technique. Data were collected using the Artificial Intelligence Literacy Scale developed by Shuai Ma and Zhenzhen Chen (2024) and the University Student Engagement Scale developed by Savita Gupta and Renu Nagpal (2021). The collected data were analyzed using Mean, Standard Deviation, t-test, ANOVA, and Pearson's Product-Moment Correlation. The findings revealed a negligible positive relationship between Artificial Intelligence Literacy and Student Engagement ($r = 0.071$, $p = 0.217$). This indicates that students with higher levels of Artificial Intelligence Literacy tend to show a slight increase in Student Engagement. However, the observed relationship was not statistically significant at the 0.05 level. The findings suggest that Artificial Intelligence Literacy may be associated with a slight positive tendency in Student Engagement among college students, although the strength of the relationship is negligible.

Keywords: *Artificial Intelligence Literacy, Student Engagement, College Students, AI Literacy, Normative Survey Method, Pearson's Product-Moment Correlation.*

Introduction

Artificial Intelligence (AI) is increasingly being integrated into higher education, changing the ways students learn, access information, and complete academic activities. As AI technologies become more common, Artificial Intelligence Literacy has become important for students to understand, evaluate, and use AI tools effectively and responsibly. Student Engagement refers to students' active participation, interest, effort, and involvement in their learning activities. AI-based tools may support engagement by providing personalized learning, immediate feedback, and easy access to educational resources. Students with better AI literacy may therefore be more capable of using these technologies effectively in their learning. However, the relationship between AI literacy and student engagement may vary depending on several factors. Hence, the present study examines the relationship between Artificial Intelligence Literacy and Student Engagement among college students. The study also explores whether increased AI literacy is associated with changes in students'

engagement in learning.

Need and Significance of the Study

The rapid development of Artificial Intelligence (AI) has brought significant changes to higher education. Students are increasingly using AI-based tools for accessing information, understanding concepts, completing academic tasks, and supporting their learning. Therefore, developing Artificial Intelligence Literacy is essential for students to understand and use AI tools effectively, responsibly, and appropriately in their educational activities. Student Engagement is an important component of effective learning. Active participation, interest, effort, and involvement in academic activities can contribute to meaningful learning experiences. Since AI provides opportunities for personalized learning, immediate feedback, and easy access to educational resources, it is important to examine whether students' level of AI literacy is associated with their engagement in learning activities. The present study is significant for students, teachers, teacher educators, and educational institutions. The findings may help teachers understand the role of AI literacy in students' learning and participation and may support institutions in planning appropriate AI-literacy programmes. The study may also provide a useful foundation for researchers who wish to conduct further studies on AI literacy, student engagement, and technology-supported learning in higher education.

Review of Related Literature

1. **Kang and Park (2026)** developed an AI literacy scale for higher education students. The study identified AI knowledge, impact assessment, performance evaluation, and practical application as important dimensions of AI literacy.
2. **Casal-Otero et al. (2023)** examined AI literacy among university students and found differences in AI knowledge based on students' academic backgrounds and previous AI experience. The study emphasized the need to develop AI literacy among higher education students.
3. **Long et al. (2026)** reviewed studies on AI and student engagement in higher education. The findings indicated that AI-based technologies can improve students' cognitive, behavioral, and emotional engagement when appropriately integrated into teaching.
4. **Xu and Zhi (2026)** studied AI-assisted learning among university students and found that AI support, teacher support, and students' learning experiences influence student engagement.
5. **Xia et al. (2025)** examined the effects of generative AI on university students' motivation and engagement. The findings showed that appropriate use of generative AI can positively support students' motivation and engagement in learning.

Objectives

1. To study the Level of Artificial Intelligence Literacy among College Students.
2. To study the Level of Student Engagement among College Students.
3. To find out whether there is any significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Gender.

4. To find out whether there is any significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Locality.
5. To find out whether there is any significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Age.
6. To find out whether there is any significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Stream of Study.
7. To find out whether there is any significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Type of Institution.
8. To find out the relationship between Artificial Intelligence Literacy and Student Engagement among College Students.

Hypotheses

1. There is no significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Gender.
2. There is no significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Locality.
3. There is no significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Age.
4. There is no significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Stream of Study.
5. There is no significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Type of Institution.
6. There is no significant relationship between Artificial Intelligence Literacy and Student Engagement among College Students.

METHODOLOGY

The present study adopted a Descriptive Survey Method. A sample of 304 college students was selected using a Simple Random Sampling Technique. Data were collected using two standardized instruments: the Artificial Intelligence Literacy Scale (AILS) developed by Shuai Ma and Zhenzhen Chen (2024) and the University Student Engagement Scale (USES) developed by Savita Gupta and Renu Nagpal (2021). In addition, a Personal Data Sheet constructed by the investigator was used to gather demographic details. The collected data were analyzed using descriptive and inferential statistical techniques such as mean, standard deviation, t-test, F-test and Pearson's Product-Moment Correlation.

TESTING OF OBJECTIVES

1. To study the Level of Artificial Intelligence Literacy among College Students:
   This section describes the level of artificial intelligence literacy among college students that obtained from the study.

Table 1 Level of Artificial Intelligence Literacy among College Students

Level of Artificial Intelligence Literacy	No of Students	Percentage %
Low	58	19.1
Moderate	177	58.2
High	69	22.7
Total	**304**	**100.0**

The above table reveals that 58 (19.1%) college students have a low level of Artificial Intelligence Literacy, 177 (58.2%) college students have a moderate level and 69 (22.7%) have a high level. It can be inferred that the majority of the college students possess a moderate level of Artificial Intelligence Literacy.

2. To study the Level of Student Engagement among College Students:

This section describes the level of student engagement among college students that obtained from the study.

Table 2 Level of Student Engagement among College Students

Level of Student Engagement	No of Students	Percentage %
Low	47	15.5
Moderate	181	59.5
High	76	25.0
Total	**304**	**100.0**

The above table shows that 47 (15.5%) college students have a low level of student engagement, 181 (59.5%) have a moderate level and 76 (25.0%) have a high level. Therefore, it is concluded that the majority of the college students exhibit a moderate level of student engagement.

TESTING OF HYPOTHESIS

Hypothesis 1

There is no significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Gender.

Table 3 showing the significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Gender.

S.No	Variables	Gender	N	Mean	SD	't' Value	Significance
1	Artificial Intelligence Literacy	Male	100	106.21	9.818	0.997	Not Significant
		Female	204	107.40	9.618		
2	Student Engagement	Male	100	63.08	4.084	0.855	Not Significant
		Female	204	63.50	3.746		

Interpretation

The obtained *t*-values for both AI Literacy and Student Engagement are **not significant at the 0.05 level**. Therefore, there is no significant difference between male and female college

students in AI Literacy and Student Engagement. Therefore, the null hypothesis is **accepted**.

Hypothesis 2

There is no significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Locality.

Table 4 showing the significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Locality.

S.No	Variables	Locality	N	Mean	SD	't' Value	Significance
1	Artificial Intelligence Literacy	Rural	89	102.90	9.327	4.940	0.01
		Urban	215	108.71	9.332		
2	Student Engagement	Rural	89	63.88	3.460	1.602	Not Significant
		Urban	215	63.14	4.000		

Interpretation

The obtained *t*-value shows a significant difference in AI Literacy between rural and urban college students at the **0.01 level.** Urban students had higher AI Literacy than rural students; hence, the null hypothesis is rejected.

For Student Engagement, the obtained *t*-value is **not significant at the 0.05 level.** Therefore, there is no significant difference between rural and urban students, and the null hypothesis is accepted.

Hypothesis 3

There is no significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Age.

Table 5 showing the significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Age.

Sl. No.	Variables	Age	N	Mean	SD	'F' Value	Significance
1	Artificial Intelligence Literacy	18-20 years	21	114.10	4.482	16.916	0.01
		21-23 years	147	108.86	9.340		
		Above 24 years	136	103.90	9.586		
2	Student Engagement	18-20 years	21	62.90	4.110	0.492	Not Significant
		21-23 years	147	63.21	3.959		
		Above 24 years	136	63.59	3.723		

Interpretation

The F-ratio shows a significant difference in AI Literacy based on age. Students aged **18–20 years** had higher AI Literacy than those aged 21–23 years and above 24 years; hence, the null hypothesis is rejected. For Student Engagement, the obtained F-ratio is **not significant at the**

0.05 level. Therefore, there is no significant difference among the three age groups, and the null hypothesis is accepted.

Hypothesis 4

There is no significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Stream of Study.

Table 6 showing the significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Stream of Study.

Sl. No.	Variables	Stream of Study	N	Mean	SD	'F' Value	Significance
1	Artificial Intelligence Literacy	Arts	69	107.26	9.626	9.917	0.01
		Science	123	109.54	9.321		
		Commerce	112	104.07	9.376		
2	Student Engagement	Arts	69	63.64	3.839	3.167	Not Significant
		Science	123	62.70	3.985		
		Commerce	112	63.91	3.650		

Interpretation

The F-ratio shows a significant difference in AI Literacy based on stream of study. Science students had higher AI Literacy than Arts and Commerce students; hence, the null hypothesis is rejected.

For Student Engagement, the obtained F-ratio is **not significant at the 0.05 level.** Therefore, there is no significant difference among Arts, Science and Commerce students, and the null hypothesis is accepted.

Hypothesis 5

There is no significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Type of Institution.

Table 7 showing the significant difference in Artificial Intelligence Literacy and Student Engagement among College Students with respect to Type of Institution.

Sl. No.	Variables	Type of Institution	N	Mean	SD	'F' Value	Significance
1	Artificial Intelligence Literacy	Government	89	102.09	9.955	98.449	0.01
		Government Aided	98	102.30	8.084		
		Private	117	114.69	4.274		
2	Student Engagement	Government	89	64.81	3.236	21.577	0.01
		Government Aided	98	64.05	3.047		
		Private	117	61.68	4.279		

Interpretation

The obtained *F*-value shows a significant difference in **AI Literacy** among college students based on the **type of institution at the 0.01 level**. Private college students had higher AI Literacy than government-aided and government college students; hence, the null hypothesis is rejected. For **Student Engagement,** the obtained *F*-value also shows a significant difference at the **0.01 level**. Government college students had higher Student Engagement than government-aided and private college students; hence, the null hypothesis is rejected.

Hypothesis 6

There is no significant relationship between Artificial Intelligence Literacy and Student Engagement among College Students.

Table 8 showing the significant relationship between Artificial Intelligence Literacy and Student Engagement among College Students.

Variables	Correlation Coefficient	P Value	Significance
Artificial Intelligence Literacy and Student Engagement	0.071	0.217	No Significant

Interpretation

From the above table, it is observed from the Pearson Correlation Coefficient Value that there is no significant relationship between Artificial Intelligence Literacy and Student Engagement. Hence the null hypothesis, there is no significant relationship between Artificial Intelligence and Student Engagement of college students is accepted.

Educational Implications of the Study

1. **Strengthening AI Literacy:** Colleges should provide structured AI literacy programmes, workshops and practical activities to improve students from moderate to higher levels of AI competency.
2. **Bridging the Rural–Urban Gap:** Special AI learning opportunities and technological support should be provided to rural students to reduce the difference in AI Literacy observed between rural and urban students.
3. **Discipline-Specific AI Education:** Since Science students demonstrated higher AI Literacy, colleges may provide additional AI-oriented learning activities for Arts and Commerce students to ensure more equitable development across streams.
4. **Institutional Support:** Government and government-aided institutions should strengthen access to AI-related learning resources and opportunities, particularly because institutional differences were found in AI Literacy.
5. **Separate Strategies for Engagement:** Since AI Literacy was not significantly related to Student Engagement, institutions should not assume that improving AI skills alone will increase engagement; dedicated teaching strategies and learner-centred activities are also needed to strengthen Student Engagement.

Conclusion

The present study concludes that college students possess a **moderate level of Artificial Intelligence Literacy and Student Engagement**. The findings show that AI Literacy varies significantly with respect to locality, age, stream of study, and type of institution, while gender does not produce a significant difference. Student Engagement also differs significantly according to type of institution, but not according to gender, locality, age, or stream of study. The most important finding is that **Artificial Intelligence Literacy and Student Engagement have a very weak positive but statistically non-significant relationship (r = 0.071, p = 0.217).** Thus, higher AI Literacy does not necessarily result in higher Student Engagement among the college students studied. Overall, the study highlights the importance of strengthening AI Literacy through appropriate educational programmes while simultaneously developing effective learner-centered strategies to enhance Student Engagement. The findings provide useful implications for students, teachers, teacher educators, and higher education institutions in promoting responsible and effective use of AI in education.

STUDENTS' ENGAGEMENT AND WELL-BEING IN THE PRESENT SCENARIO OF ARTIFICIAL INTELLIGENCE: A HUMAN-CENTERED AI MODEL FOR SECONDARY SCHOOLS

Dr. Bhavya R
Assistant Professor, D.K. Shivakumar B.Ed. College, Bhadravathi, Shivamogga, India,
E-mail: bhuvanabdvt253@gmail.com

Abstract

Artificial Intelligence (AI) is rapidly changing the educational landscape and is becoming increasingly relevant to secondary school education. In the present scenario, AI-supported tools such as generative AI, adaptive learning systems, intelligent tutoring systems, educational chatbots, and learning analytics provide new opportunities to personalize learning and improve student engagement. At the same time, the well-being of secondary school students requires greater attention because excessive technology use, academic pressure, social isolation, misinformation, privacy concerns, and overdependence on AI may negatively influence learners. This article examines the relationship between AI, student engagement, and student well-being in secondary schools and proposes a simple ***Human-Centred AI Model****. The model places the student at the centre and connects AI support, teacher guidance, student engagement, well-being, critical thinking, and holistic development. The model emphasizes that AI should complement teachers and strengthen human interaction rather than replace it.*

Keywords: *Artificial Intelligence, Student Engagement, Student Well-Being, Secondary Schools, Human-Centred AI, Personalized Learning, AI Literacy*

1. Introduction

The present educational scenario is characterized by rapid technological development, changing learning needs, digital transformation, and increasing use of Artificial Intelligence. AI has moved from being an emerging technology to becoming an important component of contemporary educational practice. Students increasingly encounter AI through educational applications, search engines, recommendation systems, generative AI tools, language-learning platforms, and digital learning environments.

Secondary school education is particularly important because students at this stage develop academic abilities, social relationships, emotional maturity, critical thinking, and aspirations for higher education and careers. Their engagement in learning and overall well-being are therefore essential for successful educational development.

AI provides opportunities to make learning more personalized and interactive. It can provide immediate feedback, recommend learning resources, adapt activities to students' abilities, and support students who require additional assistance. Research on AI-supported school learning has identified personalized learning, learning gains, and student engagement

as important potential benefits (Niyazova et al., 2026). Similarly, research on AI in K–12 education highlights the growing use of AI for personalized learning, assessment, intelligent tutoring, and educational support (Ng et al., 2023). However, AI also creates new educational challenges. Students may become dependent on AI-generated answers, experience reduced independent thinking, encounter inaccurate information, or have concerns regarding privacy and data use. UNESCO emphasizes that AI in education should be developed and implemented through a human-centred approach that protects human agency, inclusion, equity, and ethical principles (UNESCO, 2023). Therefore, the present scenario requires an approach that combines the advantages of AI with the strengths of human interaction. This article proposes a **Human-Centred AI Model for Secondary Schools** to connect AI with student engagement and well-being.

2. AI in the Present Secondary School Scenario

AI is influencing secondary education in several ways. Students can use AI-supported applications to obtain explanations, practise concepts, receive feedback, translate content, generate examples, and explore topics beyond classroom instruction. Teachers can use AI to prepare learning materials, differentiate instruction, analyse student performance, and provide formative assessment. Generative AI has further expanded these possibilities. Students can interact with AI through natural language and receive responses to questions across different subjects. However, the availability of immediate answers also creates concerns regarding academic integrity and the development of independent learning skills.

The present scenario therefore requires students not merely to **use AI**, but to understand and evaluate it. AI literacy should become an important component of secondary education. Students need to know how AI works at a basic level, recognize its limitations, verify information, understand bias, protect personal data, and use AI ethically.

3. Student Engagement in Secondary Schools

Student engagement refers to the extent to which students participate actively and meaningfully in learning. It can be understood through three major dimensions.

Behavioural Engagement

Behavioural engagement includes attendance, participation, and completion of learning activities, persistence, and involvement in classroom tasks.

Emotional Engagement

Emotional engagement involves students' interest, motivation, confidence, enjoyment, sense of belonging, and positive attitudes towards school and learning.

Cognitive Engagement

Cognitive engagement involves critical thinking, problem-solving, reflection, creativity, analysis, and the willingness to make intellectual effort. AI can support all three dimensions when appropriately integrated. Interactive activities can encourage participation, personalized learning can improve motivation, and AI-supported problem-solving can provide opportunities for deeper learning. However, engagement should not be measured simply by the amount of time students spend using technology. Meaningful engagement involves active

thinking, participation, reflection, collaboration, and purposeful learning. In the present educational scenario, the concept of happy learning is increasingly relevant to the effective use of Artificial Intelligence (AI) in education. Happy learning extends beyond conventional classroom practices by promoting curiosity, creativity, enjoyment, and lifelong learning. When students experience engaging and meaningful learning activities, they are more likely to participate actively, develop positive attitudes toward learning, and achieve better academic outcomes (Bhavya R. & Dange, J. K., 2020). AI-supported educational tools can strengthen this process by providing personalized learning experiences, immediate feedback, interactive activities, and learning resources that respond to students' individual needs and abilities. Such technology-supported experiences can increase students' motivation and engagement while making learning more flexible and enjoyable. Furthermore, integrating happiness into the learning process can contribute to improved student engagement, motivation, and academic achievement (Bhavya R. & Dange, J. K., 2021). Therefore, the integration of AI and happy learning within a human-centred approach can create a supportive educational environment in which technology enhances learning while teachers continue to provide emotional support, guidance, empathy, and meaningful human interaction.

4. AI and Student Well-Being

Student well-being is an important foundation for effective learning. It includes emotional, psychological, social, and academic dimensions. A student who feels confident, supported, safe, and connected to others is more likely to participate actively in learning. AI can support academic well-being by helping students organize learning activities, identify areas of difficulty, receive immediate feedback, and access additional learning resources. Personalized learning may help students learn at an appropriate pace and reduce some forms of academic frustration. At the same time, excessive use of AI and digital technologies may create challenges. Students may experience screen fatigue, reduced face-to-face interaction, and dependence on technology, information overload, or anxiety about academic performance. Therefore, AI should be used to **support well-being rather than become the centre of students' educational lives**.

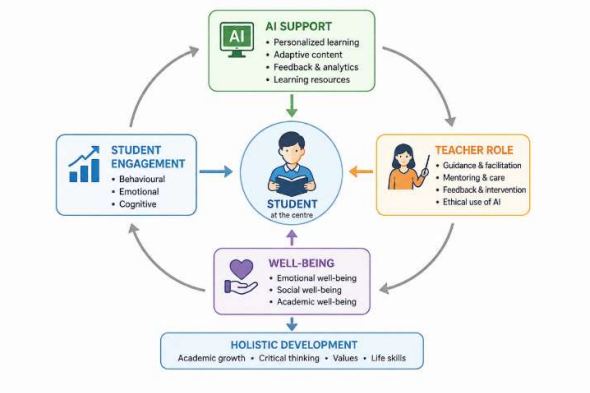
5. Need for a Human-Centred AI Approach

A human-centred approach places students' needs, dignity, agency, safety, and development at the centre of technology use. AI should serve educational purposes rather than determine them. Teachers are essential to this approach. AI can identify patterns in learning, but teachers understand students within their social, cultural, emotional, and educational contexts. AI can provide feedback, but teachers provide encouragement, empathy, mentoring, and professional judgment. UNESCO's guidance on generative AI in education emphasizes the importance of human agency, ethical considerations, data privacy, inclusion, and appropriate pedagogical use of AI (UNESCO, 2023). UNESCO's AI Competency Framework for Students also emphasizes human-centred thinking, ethics, AI knowledge, and responsible use (Miao, Shiohira, & Lao, 2024). Thus, the objective should not be **AI replacing teachers**, but **AI strengthening teachers' capacity to support students**.

6. Human-Centred AI Model for Secondary Schools

The proposed model is intentionally simple and focuses on the relationship among AI, teachers, students, engagement, and well-being.

Figure 1. Human-Centred AI Model for Enhancing Students' Engagement and Well-Being in Secondary Schools



Simple explanation of the model

The model begins with **Human-Centred AI**, which provides appropriate technological support for learning. AI provides personalized learning, feedback, accessibility, and learning analytics. This support is expected to contribute to **student engagement** through behavioural, emotional, and cognitive participation. Improved engagement can contribute to **student well-being**, particularly academic confidence, motivation, belongingness, and emotional support. The **teacher remains central** to the process by providing guidance, mentoring, feedback, empathy, and intervention. Teachers interpret AI-generated information and make professional decisions rather than allowing AI to independently determine students' needs. The interaction between AI, students, and teachers promotes **critical thinking and student agency**. Students learn to question, evaluate, verify, and responsibly use AI rather than simply accepting AI-generated information. The ultimate outcome is **holistic development**, including academic achievement, social development, emotional well-being, critical thinking, creativity, and responsible digital citizenship.

7. Major Elements of the Model

7.1 AI Support

AI provides personalized learning materials, adaptive activities, feedback, accessibility tools, and learning analytics. Its purpose is to enhance learning opportunities rather than replace classroom teaching.

7.2 Student Engagement

The model considers engagement as behavioural, emotional, and cognitive. AI should encourage students to participate, think, explore, collaborate, and reflect.

7.3 Student Well-Being

The model connects academic engagement with emotional, social, and academic well-

being. Students should experience confidence, belongingness, motivation, and appropriate academic support.

7.4 Teacher Support

Teachers provide the human dimension of education. They interpret students' needs, build relationships, provide emotional support, facilitate collaboration, and ensure responsible AI use.

7.5 Critical Thinking and Student Agency

Students should remain active decision-makers. They should question AI-generated information, verify evidence, identify errors and bias, and make independent judgements.

7.6 Holistic Development

The final goal is not simply improved test scores. The model aims at the development of academically competent, emotionally resilient, socially responsible, critically thinking, and digitally competent students.

8. Benefits of the Human-Centred AI Model

The model can provide several benefits to secondary schools.

First, AI can support **personalized learning** by adapting activities to students' needs. Second, immediate feedback can encourage students to identify and correct mistakes. Third, AI can support **inclusive education** through translation and accessibility tools. Fourth, learning analytics can help teachers identify students who may need additional academic support.

Most importantly, the model maintains the importance of human relationships. Students continue to interact with teachers and peers while using AI as a supplementary learning resource.

9. Challenges

The implementation of the model must consider several challenges.

AI dependency: Students may rely excessively on AI instead of developing independent learning skills.

Academic integrity: Generative AI can be used to produce assignments without genuine student participation.

Privacy: Student data must be protected from inappropriate collection or use.

Digital inequality: Students may have unequal access to devices, internet connectivity, and AI tools.

Misinformation: AI-generated information may be inaccurate or misleading.

Reduced human interaction: Excessive use of AI may reduce opportunities for communication and collaboration.

Teacher preparedness: Teachers require professional development to use AI effectively and ethically.

These challenges demonstrate why a human-centred approach is necessary.

10. Recommendations

Secondary schools should:

1. Develop clear policies for responsible AI use.

2. Provide AI literacy education to students.
3. Train teachers in AI-supported pedagogy.
4. Use AI for personalization and formative assessment.
5. Encourage independent thinking before using AI assistance.
6. Teach students to verify AI-generated information.
7. Protect students' personal data.
8. Maintain face-to-face teacher and peer interaction.
9. Monitor the effects of AI on students' engagement and well-being.
10. Ensure equitable access to AI-supported learning resources.

Conclusion

The present scenario of Artificial Intelligence offers significant opportunities for transforming secondary education. AI can support personalized learning, feedback, accessibility, engagement, and academic assistance. However, technology alone cannot guarantee student well-being or meaningful learning. The **Human-Centred AI Model** proposed in this article places the student at the centre of the educational process and connects AI support with student engagement, well-being, teacher guidance, critical thinking, and holistic development. The model emphasizes a partnership among **AI, teachers, and students**. The future of secondary education should therefore not be based on the question of whether AI will replace teachers. Instead, the focus should be on how AI can help teachers understand and support students more effectively while enabling students to become independent, critical, responsible, and confident learners. **AI should be a support system for human learning—not a substitute for human relationships.**

PROFESSIONAL DEVELOPMENT OF PHYSICAL EDUCATION TEACHERS THROUGH DIGITAL TOOLS

Sri. Chandregowda. S
Physical Education Director,B.E.A. College of Education, Davangere-577004.
Email id: chandregow dake% Email.com

Abstract

Professional development is essential for Physical Education (PE) teachers to improve their teaching effectiveness, professional Wowledge, technological competency, and ability to meet the changing needs of learners. The rapid development of digital technology has created new opportunities for PE teachers to enhance their professional skills. Digital tools such as video analysis applications. online learning platforms. fitness trackers, virtual classrooms. mobile applications, artificial intelligence, and social media can support continuous professional learning. This paper discusses the impouance or digital tools in the professional development of Physical Education teachers, their applications, benefits. challenges, and strategies for effective implementation. It emphasizes that appropriate integration or' technology can make PE teaching more innovative, evidence-based, inclusive, and learner-centred.

Keywords: Physical Education, Professional Development, Digital Tools, Technology. Online Learning, AI, Teacher Education

1. Introduction

Physical Education plays an important role in developing students' physical fitness, motor skills, health awareness, teamwork, discipline, and lifelong physical activity habits. The role of the Physical Education teacher is changing rapidly because of technological developments in education and sports. Traditional professional development programs such as workshops, seminars. Conferences, and training courses remain valuable. However, digital technologies provide PE teachers with flexible and continuous opportunities of professional learning. Teachers can access online.

Courses, research articles, webinars, instructional videos, digital teaching resources, and professional communities from any location.

Therefore, digital tools can become an important component of continuous professional development for Physical Education teachers.

2. Objectives of the Study

The major objectives are:

1. To examine the role of digital tools in the professional development of Physical Education teachers.
2. To identify important digital tools useful for PE teachers.
3. To examine the benefits of technology-based professional development.
4. To identify challenges faced by PE teachers in using digital technologies.
5. To suggest strategies for effective use of digital tools in professional development.

3. Digital Tools for Professional Development:

3.1 Online Learning Platforms

Online learning platforms provide PE teachers with access to courses, lectures, demonstrations, assessments, and certification programs. Teachers can update their knowledge in areas such as sports science, fitness, pedagogy, yoga, nutrition, sports

psychology, and assessment.

3.2 Video Analysis Tools

Video analysis enables teachers to record and examine students' sporting movements and techniques. Teachers can study running, jumping, throwing, gymnastics, athletics, and various sports skills through slow-motion and frame-by-frame analysis.

This helps teachers identify technical errors and provide more effective feedback.

3.3 Mobile Applications

Mobile applications can support professional learning by providing access to fitness programs, exercise demonstrations, lesson resources, spots rules, assessment tools, and educational materials.

PE teachers can also use mobile applications to monitor physical activity and fitness-related information.

3.4 Wearable Technology

Smartwatches, fitness bands, heart-rate monitors, and activity trackers provide information about physical activity, heart rate, steps, sleep, and exercise intensity. Teachers can develop professional knowledge about fitness monitoring and use such technology to improve physical activity programs.

3.5 Artificial Intelligence

Artificial Intelligence (AI) is emerging as a useful technology for teachers. AI can assist PE teachers in generating lesson ideas, creating assessment questions, organizing teaching resources, Analysing performance data, and developing individualized learning activities.

However, teachers should use AI critically and verify its information before applying it in educational settings.

3.6 Webinars and Virtual Conferences

Webinars and virtual conferences allow PE teachers to learn from experts, researchers, coaches, and educators from different parts of the world. They reduce travel requirements and provide opportunities for interaction and knowledge sharing.

3.7 Digital Professional Communities

Online professional communities allow teachers to share lesson plans, research findings, teaching experiences, sports activities, and innovative practices. Such communities encourage collaboration and lifelong learning.

4. Benefits of Digital Tools

Digital tools can provide several benefits for the professional development ot PE teachers:

- Continuous access to professional learning.
- Development or digital literacy and technological skills.
- Access to current research and teaching practices.
- Improved lesson planning.
- Better demonstration and analysis of spout skills.
- Opportunities for collaboration with other teachers.
- Flexible and self-paced learning.
- Improved assessment and feedback.
- Exposure to national and international experts.
- Development of innovative and student-centred teaching approaches.

5. Role of the Physical Education Teacher

The PE teacher should not be only a user of technology but also a critical and responsible digital educator. Teachers should:

1. Select appropriate digital tools according to learning objectives.
2. Develop digital literacy and information-literacy skills.
3. Use technology to support—not replace—physical activity.
4. Protect students' privacy and personal data.
5. Evaluate the reliability of online information.
6. Use digital assessment and feedback appropriately.
7. Participate in online professional learning communities.
8. Continuously update their technological knowledge.

6. Challenges

Despite its advantages, the use of digital tools presents several challenges:

- Lack or digital skills among some teachers.
- Limited access to devices and reliable internet.
- Cost of advanced technology.
- Lack of technical support.
- Resistance to changing traditional teaching practices.
- Privacy and data-security concerns.
- Excessive dependence on technology.
- Lack of adequate training specific to Physical Education.

These challenges needto be addressed through institutional support and systematic teacher training.

7. Strategies for Effective Professional Development

Educational institutions can strengthen digital professional development by:

- Conducting regular technology-oriented workshops.
- Organizing webinars and online training programs.
- Providing access to digital learning resources.
- Creating PE teacher online communities.
- Providing technical suppor to teachers.
- Encouraging teachers to share successful digital practices.
- Integrating AI and digital literacy into teacher education.
- Providing suitable digital infrastructure.
- Encouraging action research using digital technologies.
- Developing institutional policies for safe and ethical technology use.

8. Conclusion

Digital technology has become an important component of professional development for Physical Education teachers. Online learning platforms, mobile applications, video analysis, wearable devices, virtual conferences, digital communities, and artificial intelligence provide new opportunities for teachers to develop their professional knowledge and skills. Effective professional development should combine technological competence with sound pedagogical knowledge and practical Physical Education experience. Technology should enhance physical activity, teaching quality, assessment, collaboration, and lifelong learning rather than replace the essential practical nature of Physical Education. The future PE teacher should therefore be physically active, pedagogically competent, digitally literate, innovative, and a lifelong learner. Proper institutional support and continuous training can help teachers use digital tools effectively and contribute to quality Physical Education.

AI ETHICS LITERACY AMONG TEACHER EDUCATORS AND PRESERVICE TEACHERS: A COMPARATIVE SURVEY STUDY

Dr. Shobha M
Assistant Professor, BGS College of Education, Adichunhanagiri University, B G Nagara,
Mail.id: shobha.m20@gmail.com

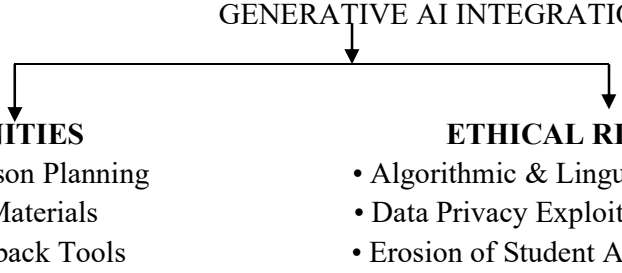
Abstract

Background: The fast growth of Generative Artificial Intelligence (GenAI) in education calls for a clear understanding of ethical AI literacy among teachers and those training to become teachers.
Purpose: This study compares how well teacher educators and preservice teachers understand areas of AI ethics. It looks at four areas: Algorithmic Bias & Fairness Data Privacy & Governance Pedagogical Integrity & Agency and Societal & Environmental Impact.
Methodology: A survey was used to collect data from 480 participants—135 teacher educators and 345 preservice teachers—from higher education institutions. The data collection followed a research approach and used a stratified two-stage cluster sampling method. The AI Ethics Literacy Scale was used, showing internal consistency ($\alpha = 0.89$). Statistical tools included statistics, independent t-tests and two-way ANOVA.
Findings: There is a difference in overall AI ethics literacy between teacher educators ($M=3.82$, $SD=0.45$) and preservice teachers ($M=3.24$, $SD=0.58$; $t(478)=10.56$, $p<.001$ $d=1.11$). Teacher educators rated higher on data privacy and pedagogical integrity. Preservice teachers had scores in algorithmic bias and long-term societal impact but were more familiar with using GenAI tools.
Implications: The study suggests that AI ethics should be included in teacher training programs and professional development. Schools and universities need to build ethical foundations around AI use.

Keywords: *AI Ethics Literacy, Teacher Education, Preservice Teachers, Generative AI, Comparative Survey, TPACK, Educational Governance.*

1.Introduction

The rise of Generative Artificial Intelligence (GenAI) including language models and image-generating tools is changing how teaching happens all over the world. These technologies can help create lessons give instant feedback and support lesson planning. They also bring serious concerns about fairness, student privacy and academic honesty. In teacher education these issues matter a lot. Teacher educators must not use AI in their own teaching and research but they also have to prepare future teachers to guide students in using AI responsibly.



Even though there is growing discussion about AI in schools few studies compare how well

teacher educators and preservice teachers understand AI ethics. Most frameworks focus on how easy it's to use technology rather than whether people can think critically about its risks. This study fills that gap by comparing AI ethics knowledge across both groups based on Saunders' Research Onion model.

1.1Objectives

1. To measure the level of AI ethics knowledge in teacher educators and preservice teachers across four key areas: algorithmic bias, data privacy, pedagogical integrity and societal impact.
2. To check if there is a difference in overall and specific area scores between the two groups.
3. To see if gender and prior training in technology affect AI ethics literacy for both groups.

1.2 Hypotheses

H1: There is a significant difference in total AI ethics literacy between teacher educators and preservice teachers.

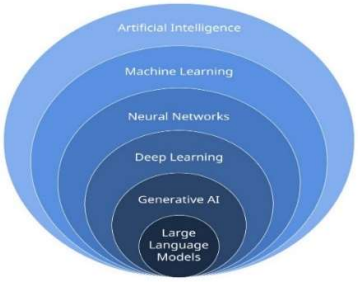
H2: Teacher educators score higher than preservice teachers in data privacy and pedagogical integrity.

H3: Prior formal training in educational technology improves AI ethics literacy in both groups.

2. Review of Literature and Conceptual Framework

2.1 A Curriculum for AI Ethics Literacy

Building on Long and Magerko's work on AI literacy and the UNESCO framework for teachers we define AI Ethics Literacy as knowing and being able to assess dangers linked to using AI in classrooms. It includes thinking recognizing problems and making smart choices.



Hierarchical scope of AI technologies informing ethical literacy

2.2 Core Dimensions of the Construct

Our framework breaks down AI ethics into four parts:

1. **Algorithmic. Fairness**: Seeing biases in datasets and AI results related to gender, culture or language.
2. **Data Privacy & Governance:** Understanding rules about data storage, who owns student information and legal issues like copyright when using public AI tools.
3. **Pedagogical. Agency**: Ensuring that AI supports learning without replacing thinking and avoiding practices that let students off the hook.
4. **Environmental Impact:** Recognizing differences in access to AI, environmental costs of running AI systems and risks of exploitation.

3. Methodology

3.1 Methodological Alignment (Research Onion)

- Research Philosophy: Pragmatism – focusing on outcomes and real-world relevance.
- Research Approach: Deductive – testing ideas based on existing theories.
- Methodological Choice: Quantitative single-method design.
- Research Strategy: Online surveys with validated psychological tools.
- Time Horizon: Cross-sectional – data collected during one term.

3.2 Sampling Strategy & Sample Size

A two-stage sampling process was used. First institutions offering teacher training were grouped by management type (private). Then participants were selected from two groups: teacher educators and preservice teachers.

The sample size was set using G*Power analysis for a samples t-test (alpha = 0.05, power = 0.80 effect size d = 0.50). This gave a minimum group size of 63.

TOTAL PARTICIPANTS (N = 480)

TEACHEREDUCATORS n = 135 (28.1%)

PRESERVICE TEACHERS n = 345 (71.9%)

3.3 Instrumentation:

Data was gathered using the AI Ethics Literacy Scale (AI-ELS) a 20-item tool on a 5-point Likert scale (1 = Disagree, 5 = Strongly Agree). The scale had reliability (α = 0.89).

Dimension	Sample Item	No. of Items	Cronbach's α
Algorithmic Bias	"I can identify cultural or gender biases present in AI-generated lesson plans."	5	0.84
Data Privacy	"I refrain from inputting identifiable student data or assessments into public GenAI tools."	5	0.88
Pedagogical Integrity	"I know how to design assessments that maintain integrity without relying on unreliable AI detectors."	5	0.82
Societal Impact	"I am aware of the environmental and socioeconomic disparities tied to commercial AI access."	5	0.81

4. Results & Findings

4.1 Comparative Analysis (Hypothesis Testing)

An independent t-test compared scores between the two groups.

Subgroup	N	Mean (M)	SD	*t*	df	*p*	Cohen's *d*
Teacher Educators	135	3.82	0.45	10.56	478	< .001	1.11
Preservice Teachers	345	3.24	0.58	—	—	—	—

Note. An independent-samples *t*-test was performed to determine whether a statistically significant difference existed in the scores of teacher educators and preservice teachers. The findings revealed that teacher educators (M = 3.82, SD = 0.45) reported significantly higher scores than preservice teachers (M = 3.24, SD = 0.58), $t(478) = 10.56$, $p < .001$. The magnitude of the observed difference was substantial, as indicated by a Cohen's d value of

1.11, representing a **large effect size**. These findings suggest that the two groups differed considerably in their scores on the variable under investigation.

H1 is supported: Teacher educators scored higher overall.

4.2 Breakdown Across Sub-Dimensions

Mean scores for each area show where strengths and weaknesses lie.

SUB-DIMENSION MEAN COMPARISON		
Sub-Dimension	**Educators**	**Preservice Teachers**
Algorithmic Bias & Fairness	3.64	2.91
Data Privacy & Governance	4.12	3.10
Pedagogical Integrity & Agency	4.05	3.55
Societal & Environmental Impact	3.47	3.40

- Data Privacy & Governance: Teacher educators (M=4.12) clearly knew more about privacy rules than preservice teachers (M=3.10). H2 holds.
- Algorithmic Bias: Preservice teachers scored lowest here (M=2.91) showing that even though they use tools like ChatGPT they rarely question bias in results.

4.3 Factor Analysis: Impact of Prior EdTech Training

A two-way ANOVA looked at role and past training.

- Main Effect of Role: $F(1,476)=78.42$, $p<.001$ $\eta p^2=.141$
- Effect of Prior Training: $F(1,476)=34.12$, $p<.001$, $\eta p^2=.067$
- Interaction Effect (Role × Training): $F(1,476)=2.15$, $p=.143$ (not significant)

H3 is confirmed: Both groups get a boost in ethics knowledge when they've taken formal EdTech courses. This effect does not depend on whether someone's a teacher educator or a student.

5. Discussion

The findings indicate a significant difference between teacher educators and preservice teachers in AI ethics-related understanding, suggesting an important **operational–ethical gap in teacher education**. Preservice teachers may demonstrate greater familiarity and confidence in using generative artificial intelligence (GenAI) tools, particularly in relation to prompting, content generation, and digital applications. However, operational proficiency does not necessarily imply adequate awareness of the ethical implications of AI use. Issues such as algorithmic bias, privacy and data protection, misinformation, intellectual property, academic integrity, and the reliability of AI-generated content require critical and ethical judgement beyond technical competence. Thus, the ability to use AI effectively should be distinguished from the ability to use it responsibly and ethically.

Teacher educators, on the other hand, are likely to possess stronger professional and institutional knowledge concerning educational policies, data protection, assessment practices, and principles of fairness and accountability. Nevertheless, the rapid emergence of generative and multimodal AI technologies may create challenges in translating these established principles into specific classroom practices. This suggests a complementary gap: preservice

teachers may possess greater operational familiarity with emerging AI tools, whereas teacher educators may have stronger conceptual and professional grounding but require continued exposure to evolving AI applications. Such a disparity is particularly significant because teacher educators are responsible for preparing future teachers who will influence the adoption and responsible use of AI in school contexts.

The findings further suggest that **AI ethics literacy should be treated as an integral component of teacher professional preparation rather than as an incidental outcome of technology use**. Familiarity with AI tools alone cannot ensure responsible decision-making. Teacher education programmes therefore need to integrate ethical considerations with technological and pedagogical competencies. Authentic educational dilemmas—such as the use of chatbots in student assignments, the use of AI-generated feedback for assessment, protection of student information in cloud-based applications, and the identification of bias or inaccurate AI-generated content—can provide meaningful contexts for developing ethical reasoning and professional judgement.

The significant effect associated with training provides further support for the importance of **structured and targeted curriculum-based interventions** in developing AI ethics literacy. AI ethics knowledge cannot be assumed to develop automatically through exposure to AI technologies or informal self-directed learning. Rather, it requires systematic instruction, critical reflection, and opportunities to apply ethical principles to authentic educational situations. Case studies, scenario-based learning, role-playing, reflective discussions, and collaborative activities involving teacher educators and preservice teachers could provide effective pedagogical approaches for strengthening ethical decision-making.

Overall, the findings emphasise that **AI competence in teacher education must extend beyond technological proficiency to include ethical awareness, critical evaluation, and professional responsibility**. Preparing teachers for AI-integrated classrooms therefore requires programmes that enable future educators not only to use AI tools, but also to critically question their outputs, recognise potential risks, evaluate their educational appropriateness, and guide learners towards responsible and ethical engagement with artificial intelligence.

6. 6. Conclusion

The present study demonstrates the importance of strengthening AI ethics literacy within teacher education. The findings indicate that technological proficiency in using generative AI does not necessarily translate into adequate ethical awareness or responsible decision-making. This highlights the need to develop AI competence as a multidimensional construct encompassing technological knowledge, critical evaluation, ethical reasoning, and professional judgement. AI ethics should therefore be positioned as a core component of teacher preparation rather than as an optional or supplementary area of study. Systematic exposure to ethical principles and authentic AI-related educational dilemmas can enable preservice teachers and teacher educators to make informed decisions regarding the responsible use of AI in teaching, learning, assessment, and educational research.

7. Recommendations

Based on the findings, the following recommendations are proposed:

- **Curricular integration:** B.Ed. and M.Ed. programmes should incorporate structured AI ethics and critical AI literacy content addressing algorithmic bias, data privacy, academic integrity, transparency, responsible prompting, and ethical decision-making.
- **Professional development:** Regular faculty development programmes should be organised to enhance teacher educators' knowledge of emerging AI technologies and their ethical and pedagogical implications.
- **Institutional governance:** Teacher education institutions should establish clear policies and guidelines specifying responsible and acceptable uses of AI in teaching, learning, assessment, and research.
- **Experiential learning:** Case studies, scenario-based activities, role-play, and reflective discussions should be incorporated to develop practical ethical reasoning and decision-making skills.
- **Continuous curriculum review:** AI ethics curricula and institutional guidelines should be periodically reviewed and updated in response to the rapid evolution of AI technologies and emerging ethical concerns.

PEDAGOGICAL INNOVATIONS AND INSTRUCTIONAL STRATEGIES IN TEACHING SCIENCE IN THE ERA OF AI

Shilpa Shri R D
Research Scholar, Department of Studies and Research in Education, Karnataka State Open University, Mysore 570006, India, Email:smileeshri28@gmail.com
Sharanamma R
Associate Professor, DOS&RE, KSOU, Mysuru 570006, sharanammajajur@gmail.com

Abstract

Innovative teaching methods and strategies in science education play a vital role in boosting student involvement and achieving high academic standards. Recently, there has been a movement towards smart pedagogy, which incorporates features such as adaptability and self-directed learning to better fit the frameworks of smart education and smart classrooms (Uskov et al., 2018). Despite global advancements, certain areas, such as Somaliland, continue to depend on conventional didactic approaches, underscoring the necessity for contemporary teaching methods that promote lifelong learning (Yasin and Kabeta, 2023). Strategies that encourage innovation, such as teaching based on augmentation, have proven effective in enhancing teaching practices by encouraging discussion and critical thinking in science classes (Yılmaz et al., 2017). Educational models are being transformed by technology, particularly AI, which enables personalized and engaging learning experiences, as evidenced by tools such as ChatGPT (Bouriami et al., 2025). Moreover, the integration of flipped classrooms in mathematics education signifies a significant pedagogical shift, enhancing understanding and engagement in STEM fields (Egara et al., 2025). These innovations collectively contribute to a more flexible and dynamic educational environment, better preparing students for future challenges in the fields of science and technology.

Keywords: *Innovative strategies, teaching through augmentation, flipped classroom, educational innovation.*

Introduction

The incorporation of Artificial Intelligence (AI) into educational innovation is profoundly transforming teaching methods by promoting personalized, adaptive learning environments that focus on students in diverse educational settings.

AI technologies, including adaptive learning platforms, intelligent tutoring systems, and analytics tools powered by AI, offer immediate feedback and personalized learning paths, thereby improving the educational experience. AI-driven methods allow educators to customize teaching strategies to meet the distinct needs and preferences of each student, fostering a learner-focused approach that emphasizes engagement and learning efficiency (Mittal et al., 2024; Sumartono et al., 2025).

Supporting pre-service and in-service teacher education to enhance instructional preparation that incorporates ethical judgment and pedagogical reasoning based on AI use is crucial for pedagogical innovation. Teachers can creatively use AI tools while overcoming obstacles such

as content evaluation and school limits when AI-driven instructional activities are incorporated into teacher education. This fosters technological knowledge, pedagogical integration, and ethical awareness. According to these trends, to promote innovation readiness in the AI era, teacher preparation programs should prioritize experiential learning, real tasks, and reflective practices (Gulen & Kucuk, 2026; Wang et al., 2026).

Beyond teaching, AI integration in higher education includes curriculum design, material creation, assessment methods, and increased administrative efficiency. AI supports learning analytics, provides prompt feedback, and simplifies institutional procedures to support sustainable educational practices. Comprehensive use cases for the successful use of AI in higher education, however, are still a developing field that needs further research to guide governance and policy for long-term AI-driven educational models (Labib & Elsabry, 2024).

The impact of AI is especially noticeable in specialized domains such as engineering education, where it makes individualized curriculum design, virtual laboratories, and intelligent coaching possible. By improving accessibility and engagement, the combination of AI with technologies such as big data, cloud computing, and 5G spurs pedagogical innovation. However, to promote inclusiveness and efficacy in AI-based educational initiatives, obstacles pertaining to infrastructure, resistance to change, and equity issues require strategic solutions (Zhang et al., 2024).

In entrepreneurial education, AI serves as both an impetus and a tool for pedagogical innovation, although current student engagement with AI remains limited to a few tools. Theoretical models propose embedding AI more broadly to enhance entrepreneurial learning, underscoring the importance of identifying effective practices and overcoming adoption challenges to maximize AI's educational benefits of AI (Labyad et al., 2024).

Integrating AI with educational theories, such as multiple intelligences, is another advancement. This integration promotes individualized training that fosters creativity and problem-solving skills by using AI-enabled smart interaction technologies (such as speech and image recognition) to monitor and analyze students' abilities in real time. AI-assisted multi-intelligence frameworks offer new opportunities for pedagogical innovation by bridging the gaps between conventional teaching approaches and future workforce demands (Palarimath et al., 2024).

AI integration has also been beneficial for distance learning. In e-learning, blended learning, and mobile learning formats, AI-driven systems support accessibility, flexibility, and personalized learning. However, ongoing optimization is necessary to improve pedagogical efficacy and handle integration issues to fully realize AI's promise in distance learning (Morgado et al., 2005).

Finally, studies on education reveal that AI applications are expanding and changing quickly, with machine learning, learning analytics, and educational data mining being important hotspots. Emerging AI paradigms, explainable AI (XAI) and generative AI, are expanding educational frontiers and fostering ongoing pedagogical innovation by enhancing academic prediction, dropout avoidance, and performance evaluation (Qu & Yang, 2024). Personalized and adaptable learning environments, better teacher preparation, integration into specialized and higher education, improved distance learning modalities, and changing

research trends are all characteristics of AI-driven pedagogical innovation.

Science education has undergone substantial transformation owing to pedagogical innovations and instructional methodologies that embrace technological advances and adjust to the needs of contemporary learners. The use of Active Learning techniques, especially in the AI-driven era, is an important innovation that moves education from a knowledge-centered to a learner-centered paradigm (Bouriami et al., 2025). The incorporation of technologies such as ChatGPT is an example of how technology can encourage student autonomy and customize learning experiences, both of which have a beneficial impact on the quality of education. Pedagogical Link-Making is another fundamental strategy that emphasizes connecting scientific ideas during class discussions.

By identifying three types of link-making and related teaching techniques that enhance comprehension in science classrooms, this approach emphasizes the significance of sociocultural perspectives in science education (Scott et al., 2011). Innovative approaches, such as game-based learning and flipped classrooms, have been acknowledged in health professions education, such as in the teaching of dental materials science. In addition to increasing student participation, these tactics are linked to favorable opinions among students (Lin et al., 2023). Through inclusive leadership techniques, it has been demonstrated that the implementation of flipped classrooms and problem-based learning greatly enhances critical thinking and learning results. This method creates a dynamic and encouraging learning environment that promotes critical thinking and active engagement (Bhuttah et al. 2024). Furthermore, the application of artificial intelligence (AI) to STEM education is a rapidly developing topic that uses AI to support sophisticated analytics, instructional automation and personalized learning. By addressing several issues and enhancing both immediate and long-term learning outcomes, this integration seeks to improve STEM education (Triplett, 2023). Finally, encouraging curiosity has become a key pedagogical approach in science education. In addition to motivating students and improving memory encoding, curiosity fosters exploratory behavior, which increases engagement and improves learning outcomes. The creative use of instructional resources and broad language models, which greatly increase student involvement in science learning, are strategies for promoting curiosity (Hunaepi et al. 2024).

Need for the study

Because scientific education must be more effective, engaging, and inquiry-based, it is essential to study pedagogical innovations and instructional strategies. Traditional methods often fail to foster critical thinking, creativity, and practical problem-solving. Given the speed at which science and technology are developing, educators must use innovative teaching strategies that promote conceptual understanding and active learning in the classroom. Students' interest, excitement, and academic achievement can be enhanced by looking at modern teaching techniques, including project-based learning, flipped classrooms, and STEM integration. This study is essential for identifying best practices, improving learning outcomes, and preparing students to meet the expectations of a society that is becoming increasingly reliant on science.

Theoretical Framework

The study of Pedagogical Innovations and Instructional Strategies in Teaching Science is theoretically grounded in constructivist learning theory, which stresses active knowledge production through experience and interaction. Vygotsky's Social Development Theory, which highlights the significance of the social environment and scaffolding in learning, also informs this method. Additionally, Bruner's Spiral Curriculum and Piaget's Cognitive Development Theory enable age-appropriate inquiry-based education. When combined, these theories encourage innovative methods that foster increased understanding, critical thinking, and scientific literacy through hands-on experiments, collaborative projects, and technology integration. The study and evaluation of instructional techniques that promote the goals of science education in the twenty-first century are guided by this framework.

Review of literature

Nikolaieva, O., Nikolaiev, V., Yanchytska, K., Yuzkiv, H., and Ytvynenko, N. (2023). Modern pedagogical discourse is based on innovative approaches to teaching the humanities and social sciences. Multidisciplinary Science Journal, 5, Innovation in education is critical because it makes it possible to continuously improve the quality and value of educational content. The purpose of this article is to highlight the use of a "innovative environment" in higher education as an important component of instructional discourse. Investigating methods for integrating cutting-edge approaches into the teaching of social sciences and humanities in higher education is still relevant. The results of this study serve as a basis for pedagogical discourse in higher education by demonstrating the benefits of creative approaches in teaching humanities courses.

Manasia, L., and Ciolan, L. (2024). Imagining innovation in higher education: An innovative pedagogical photovoice research. In Higher Education, Active Learning In order to investigate new pedagogical practices in higher education, Ciolan and Manasia's study "Picturing innovation in higher education: A photovoice study of innovative pedagogies" uses photovoice as a participatory research approach. 43 students from a variety of fields participated in the study, which took place over three academic semesters. In order to identify four primary clusters of innovative pedagogies—"Hero Pedagogies," "Community and Solidarity Pedagogies," "Sustainable Green Pedagogies," and "Technology Enhanced Pedagogies"—this method combined photographs and self-authored narratives as data sources and analyzed them using Interpretative Phenomenological Analysis (IPA) and photovoice (Ciolan and Manasia, 2024).

Duschl (2019). Using knowledge with scientific practices, early childhood instructional pathways, teaching experiments in science and mathematics, upper/lower anchors for measuring progress, and concepts & practices are the five domains covered by the paper's introduction and framework for LP research, which also describes its historical development and future research directions. The conclusion discusses more general difficulties that planners, researchers, and teachers encounter with incorporating LP into STEM education.

Martin et al., 2024.The importance of effective pedagogical strategies is echoed in another study proposing the 3C Model to teach coding and computational skills in primary education. This model is crafted to align with students' developmental stages and encourage engagement

through physical computing and digital coding platforms, thereby enhancing CT skills beyond procedural and rote learning.

Kandemir and associates, 2020.Several important elements are highlighted in the literature on the pedagogy of teaching basic text-based programming via the perspective of computational thinking (CT). Kandemir, Kalelioğlu, and Gülbahar's study highlights how theory and practice are intertwined while teaching programming. They offer a pedagogical framework that incorporates programming paradigms, implementation strategies, instructional approaches, and methodologies based on CT ideas.

Yin and colleagues, 2024.Collaborative learning (CL) strategies, which are acknowledged as key approaches in CT education, also promote group work that boosts the effectiveness of CT interventions. Despite the fact that many studies lack detailed descriptions of group compositions, the utilization of diverse CL activities in classrooms emphasizes the significance of collaboration in instruction.

Mills and associates, 2024.Another study examines how coding and CT are incorporated into curricula in various nations, highlighting aspects of educational settings that effectively foster the development of these abilities. It suggests that CT abilities are essential for contemporary education and emphasizes the need for pedagogical frameworks that facilitate interdisciplinary learning in addition to addressing curricular limits.

Research Methodology

In order to investigate the concepts in current discussions of Science for Life: "Pedagogical Innovations and Instructional strategies in Teaching Science in the Era of AI" the methodology for this topic paper entails qualitative research and a systematic review of related literature. A thorough search of academic books, journals, and articles was part of the procedure, and a systematic review was carried out to compile, evaluate, and synthesize the body of knowledge already available on the subject.

Research Objectives

- To investigate how AI tools, such as ChatGPT and intelligent tutoring systems, can be integrated into science teaching to enhance personalized learning, improve student engagement, and optimize instructional methods by tailoring content to individual needs and fostering interactive learning environments (C Gurion et al., 2025; Mishra, 2024; Mustofa et al., 2025).
- To examine the effectiveness of AI-enabled pedagogical strategies in science education, particularly in STEM fields, by assessing their impact on students' cognitive, skill, and affective learning outcomes and flow experiences(Shi et al., 2024; Triplett, 2023).
- To analyze educators' readiness and identify professional development needs for the ethical and efficient implementation of AI-driven instructional tools in science classrooms, with emphasis on building AI literacy and ethical guidelines to balance technology use with maintaining teacher-student interaction and educational propriety (C Gurion et al., 2025; Siddiqui, 2025; Vorobyeva et al., 2025).
- To explore and propose innovative AI-based pedagogical models that support transformative learning, adaptive instruction, and collaborative environments in

science education that also address challenges like algorithmic bias, data privacy, and inclusivity (Siddiqui, 2025; Sumartono et al., 2025).

- To evaluate the technical and ethical challenges of integrating AI technologies in science teaching and learning, including issues of overreliance, content validity, infrastructure, and the need for critical human oversight, with recommendations to harmonize AI innovations with traditional teaching approaches for inclusive and effective science education (C Gurion et al., 2025; Mustofa et al., 2025; Vorobyeva et al., 2025).

Research Questions

1. To recognize and evaluate cutting-edge pedagogical strategies applied to scientific instruction at different educational levels.
2. To assess how well contemporary teaching methods such as inquiry-based learning, flipped classrooms, and project-based learning affect students' conceptual comprehension and interest in science.
3. To assess how scientific learning outcomes are affected by technology-integrated teaching strategies.
4. To investigate the attitudes, readiness, and perceptions of science instructors about the adoption of educational innovations.
5. To evaluate how inclusive teaching methods and customized instruction can help science classrooms accommodate a diverse student body.
6. To assess student accomplishment, motivation, and critical thinking by contrasting new instructional practices with conventional teaching approaches**.**

Discussion and Results

1. To recognize and evaluate cutting-edge pedagogical strategies applied to scientific instruction at different educational levels.

Adaptive learning technologies have significantly enhanced student engagement in science education by offering personalized learning experiences tailored to individual students' needs. These technologies utilize artificial intelligence (AI) and machine learning algorithms to adapt content and pace based on students' progress, learning styles, and interaction patterns, thereby fostering a more engaging and effective educational environment.

One of the primary ways in which adaptive learning technologies enhance student engagement is through personalized feedback and learning pathways. By leveraging AI-driven systems, students receive real-time feedback and are guided through personalized learning journeys that consider their unique strengths and weaknesses. This personalization enables students to engage more deeply with the material, as they are not constrained by the one-size-fits-all approach of traditional teaching methods (Yaseen et al., 2025 ; Zhao et al., 2024).

Moreover, adaptive learning platforms incorporate interactive elements and gamified experiences that further boost students' motivation and involvement. Features such as virtual labs and interactive assignments allow students to apply theoretical concepts in practical scenarios, enhancing both their engagement and understanding. For instance, educational platforms such as Coursera and Khan Academy have been highlighted for integrating such

adaptive technologies to improve accessibility and flexibility in learning, coupled with real-time analytics to provide personalized feedback (Isaeva et al., 2025).

Studies have shown that students exposed to adaptive learning technologies often demonstrate higher engagement levels than those in traditional educational settings. The ability of these systems to cater to individual learning preferences and paces leads to increased motivation and participation in the learning process. In the digital age, these personalized experiences are crucial for maintaining interest and ensuring that students remain invested in their learning journeys (Luo, 2023; Jiao, 2024).

Furthermore, adaptive technologies have been found to enhance educational outcomes by improving engagement and performance. By aligning with students' interests and abilities, these technologies encourage active participation and facilitate better academic achievement. For example, AI-driven systems such as Smart Sparrow and IBM Watson Education have reported higher course completion rates and improved student performance, confirming the powerful role of personalized adaptive learning tools in education (Sari et al., 2024).

In summary, adaptive learning technologies represent a transformative advancement in science education, enhancing student engagement through personalized learning experiences, real-time feedback, and interactive tools that facilitate active learning. These technologies not only bolster motivation and participation but also lead to improved educational outcomes, showcasing their pivotal role in modernizing education and meeting the diverse needs of learners in the digital era.

2. To assess how well contemporary teaching methods such as inquiry-based learning, flipped classrooms, and project-based learning affect students' conceptual comprehension and interest in science.

When integrating adaptive learning technologies into conventional classrooms, educators encounter a number of obstacles. The requirement for sufficient infrastructure to support these technologies is one of the main issues. The complete adoption of adaptive learning platforms is hampered by the unavailability of modern hardware and high-speed Internet in many educational institutions (Bușu, 2024; Denga & Denga, 2024). The need for professional development and teacher training programs is another major obstacle. To successfully include adaptive technologies into their teaching methods, educators must be proficient in their use. However, there are frequently insufficient resources and training programs to give educators the tools they need to effectively use these technologies (Santos et al., 22024; Isaeva et al., 2025).

Concerns about ethics and privacy present serious difficulties as well. In order to give students individualized learning experiences, adaptive learning technologies gather enormous volumes of student data. This brings up concerns about the security and privacy of student data. To protect student data, educators must make sure these systems adhere to ethical and legal requirements (Akavova et al., 2023). It is very difficult to guaranty fair access to this technology. The digital divide may get wider if students from different socioeconomic backgrounds have varying degrees of access to technology outside of the classroom. The learning outcomes anticipated from the deployment of adaptive learning technology in conventional classroom settings may be impacted by this inequality (Denga and Denga, 2024;

Santos et al., 22024).

Ultimately, even while adaptive learning technologies have a lot to offer in terms of enhancing student engagement and personalizing instruction, their effective incorporation in traditional classrooms depends on finding solutions to these problems. Educators and institutions must focus on infrastructure development, teacher training, privacy guaranties, and equitable access if they are to fully exploit the potential of adaptive learning technology in education.

In order to support adaptive learning technologies, schools can improve their technology infrastructure in a variety of important ways. In order to protect student privacy, schools must first ensure that their infrastructure is ready, which includes modernizing equipment, ensuring reliable Internet connectivity, and implementing robust security measures. The deployment of adaptive learning platforms may be hampered by technical limitations or security risks in the absence of these essential elements (Singh and Kaunert, 2024; Sari et al., 2224). Another essential element is the integration of cloud-based technology, such as Learning Management Systems (LMS) and AI-driven analytics, which enable customized learning experiences and provide teachers with insights on students' progress.

Real-time feedback and the scalable and adaptable deployment of instructional technologies are made possible by cloud integration (Venice et al., 2024). To guaranty that teachers are sufficiently prepared to employ adaptive learning technologies, schools should also prioritize teacher training and ongoing professional development. The potential benefits for pupils would be limited if teachers lacked the necessary training to incorporate these tools into their lesson plans (Isaeva et al., 2025). Ensuring that every student has an equal opportunity to benefit from these technologies is another crucial tactic for resolving equity and access challenges. This entails initiatives to close the digital divide, especially for disadvantaged students who might not have access to devices or internet connectivity (Mulenga and

By providing individualized educational content that suits each student's needs and learning preferences, investing in adaptive learning platforms that include AI and machine learning will further improve personalization and engagement. AI solutions can improve learning outcomes and engagement by automating administrative activities, provide real-time feedback, and producing thorough progress reports (Akavova et al., 22023; Yaseen et al., 2025). Lastly, institutions will be able to continuously maximize their usage of adaptive learning systems by implementing a strategic approach to managing these technologies, which includes continuous evaluation and iterative development. The likelihood of effective adoption and integration can be increased by involving stakeholders in the planning and implementation process, such as educators, students, and parents (Sajja et al., 22024; Singh and Kaunert, 2024).

3. To assess how scientific learning outcomes are affected by technology-integrated teaching strategies.

Schools can enhance their technology infrastructure in a number of important ways to support adaptive learning technologies. Schools must first make sure that their infrastructure is ready, which entails updating gear, guaranteeing dependable internet access, and putting strong security measures in place to safeguard student privacy. In the absence of these fundamental components, technical constraints or security threats could impede the implementation of

adaptive learning platforms (Singh and Kaunert, 2024; Sari et al., 2224). The integration of cloud-based solutions, such Learning Management Systems (LMS) and AI-driven analytics, which allow individualized learning experiences and give teachers insights into students' progress, is another crucial component.

Real-time feedback and the scalable and adaptable deployment of instructional technologies are made possible by cloud integration (Venice et al., 2024). In order to guaranty that teachers are adequately prepared to employ adaptive learning technologies, schools should also prioritize teacher training and ongoing professional development. Teachers may find it difficult to incorporate these tools into their lesson plans without the right training, which would restrict the potential advantages for students (Isaeva et al., 2025). Ensuring that every student has an equal opportunity to benefit from these technologies is another crucial way to address equity and access challenges. This includes initiatives to close the digital gap, especially for students from disadvantaged backgrounds who might not have access to the gadgets they need or internet connectivity (Mulenga and Shilongo, 2024; Dagunduro et al., 2024).

By providing individualized educational content that suits each student's needs and learning preferences, investing in adaptive learning platforms that include AI and machine learning will further improve personalization and engagement. AI solutions can improve learning outcomes and engagement by automating administrative activities, provide real-time feedback, and producing thorough progress reports (Akavova et al., 2022023; seen et al., 2025). Lastly, institutions will be able to continuously maximize their usage of adaptive learning systems by implementing a strategic approach to managing these technologies, which includes continuous evaluation and iterative development. The likelihood of effective adoption and integration can be increased by involving stakeholders in the planning and implementation process, such as parents, teachers, and students (Sajja et al., 2024; Singh and Kaunert, 2024).

4. To investigate the attitudes, readiness, and perceptions of science instructors about the adoption of educational.

Schools should emphasize updating its hardware infrastructure, concentrating on reliable devices, quick and dependable Internet connectivity, and interactive displays, in order to successfully adopt adaptive learning technology. In particular, investing in interactive whiteboards or projectors, providing high-speed internet with robust Wi-Fi coverage, and updating to tablets or laptops with touchscreens can greatly improve the learning experience and enable individualized learning.

1. **Devices**

• Tablets or laptops with touchscreens: Students can connect with adaptive learning platforms and content with ease thanks to these devices' portability and user-friendly interface. For some adaptive learning apps, like interactive activities and sketching, touchscreen capabilities is essential.

• Device Specifications: Verify that devices have enough memory, processing power, and storage to meet the needs of multimedia material and adaptive learning software. • Durability and Battery Life: To reduce interruptions during classes, select gadgets that can endure the rigors of regular classroom use and have a long battery life.

2. Access to the Internet:

• High-Speed Internet Access: To access adaptive learning platforms, watch instructional videos, and download educational materials, you need a fast and dependable Internet connection.

• Strong Wi-Fi Coverage: To enable several devices to connect at once, schools should make sure that all classrooms and common areas have strong Wi-Fi coverage.

• Examine Backup possibilities: In the event of a primary internet outage, look into backup internet connectivity possibilities.

3. Interactive Visuals:

• Interactive whiteboards or projectors: Teachers can use these tools to support collaborative learning activities and dynamically deliver adaptive learning information.

• Take Resolution and Brightness into Account: For good material visibility, especially in well-lit classrooms, make sure the display has high resolution and brightness.

• Touchscreen Functionality: Touchscreen-equipped interactive whiteboards increase student engagement and enable direct interaction with the course content.

4. Accessory Equipment:

• Headsets: Give students headsets for interactive sessions and audio-based learning exercises.

• Digital Pens: Digital pens can improve students' natural writing and drawing experiences whether they use tablets or interactive whiteboards.

• Printers: Make sure there are printers available so that worksheets, tests, and other educational resources may be printed.

5. Future-Proofing

• Scalability: Select hardware that can be readily expanded to handle future student enrollment increases or the introduction of new adaptive learning technologies.

• Accessibility: To help students with impairments, make sure hardware is compatible with assistive technology.

• Integration with Current Systems: Take into account how new hardware will work with the school's current learning management system and IT infrastructure.

Conclusion

In conclusion, pedagogical innovations and instructional techniques are critical to improving scientific education. In order to provide a more stimulating and productive learning environment, pedagogical innovations and instructional strategies in scientific education are varied and include the use of cutting-edge technologies, active learning techniques, and curiosity-driven approaches. Although these tactics differ in their particular applications and settings, they all aim to improve student involvement, learning procedures, and academic results. Teachers can foster students' critical thinking, increased comprehension, and active engagement by going beyond traditional methods.

Inquiry-based learning, using digital tools like AI, and group projects are creative ways to make science more relevant and approachable. Effective teaching strategies increase academic achievement while satisfying a range of learning needs. Adopting these innovations requires flexibility, continuous teacher training, and institutional support. Innovative education is

eventually necessary to produce future students who are scientifically literate and capable of problem-solving.

ARTIFICIAL INTELLIGENCE AND PEDAGOGICAL INNOVATIONS IN EDUCATION: REIMAGINING TEACHING, LEARNING, ASSESSMENT AND THE ROLE OF THE TEACHER

Mrs. Chaitra H V
Assistant Professor, D K Shivakumar B. Ed College, Bhadravathi, Karnataka

Abstract

Artificial Intelligence (AI) has emerged as one of the most influential technological developments shaping contemporary education. Its evolution from intelligent tutoring systems, adaptive learning environments and automated assessment to generative artificial intelligence (GenAI), large language models and multimodal AI has created new possibilities for teaching and learning. At the same time, the rapid diffusion of AI has raised fundamental questions concerning pedagogy, teacher agency, learner autonomy, assessment validity, academic integrity, equity, privacy and the purpose of education. This review paper examines the changing relationship between artificial intelligence and pedagogical innovation, with particular attention to personalized learning, intelligent tutoring, AI-supported content creation, adaptive feedback, collaborative learning, inquiry-based learning, assessment and learning analytics. The paper adopts a conceptual narrative review approach and synthesizes findings from major scholarly reviews, recent empirical literature and international policy documents. The literature indicates that AI can facilitate differentiated instruction, provide immediate and personalized feedback, support learner engagement, assist teachers in instructional planning, and expand opportunities for flexible and individualized learning. Recent experimental evidence also suggests that appropriately designed ChatGPT-supported interventions can improve academic performance, affective-motivational outcomes and higher-order thinking propensities, although methodological limitations require cautious interpretation. At the same time, excessive dependence on AI may weaken learner agency, encourage superficial engagement and create new forms of academic misconduct. The paper argues that the educational value of AI does not reside primarily in the technology itself but in the quality of pedagogical design surrounding its use. A human-centred pedagogical framework is therefore proposed in which AI functions as an augmentation technology rather than a replacement for teachers. The paper concludes that the future of AI-enabled education should be guided by pedagogical purpose, human agency, ethical responsibility, inclusion, critical thinking and continuous teacher professional development.

Keywords: *Artificial Intelligence, Generative AI, Pedagogical Innovation, Personalized Learning, AI in Education, Intelligent Tutoring Systems, Teacher Role, Assessment, Higher Education, Human-Centred Education*

1. Introduction

Education has historically evolved in response to changes in society, knowledge, technology and the workplace. The emergence of Artificial Intelligence (AI) represents a particularly significant transformation because AI is not simply another medium for delivering educational content. Unlike conventional educational technologies, AI can analyse learner data, generate content, provide feedback, recognize patterns, adapt learning pathways and increasingly participate in natural-language interaction with teachers and students. Consequently, AI has the potential to influence not only the delivery of instruction but also the fundamental

pedagogical processes through which teaching and learning are designed.

Artificial Intelligence in Education (AIEd) is not a completely new phenomenon. Intelligent tutoring systems, adaptive learning environments, automated essay scoring, learner profiling, recommendation systems and predictive analytics have been investigated for several decades. A major systematic review by Zawacki-Richter et al. (2019), for example, identified four broad areas of AI application in higher education: profiling and prediction, assessment and evaluation, adaptive systems and personalization, and intelligent tutoring systems. However, the review also identified limited engagement with pedagogical theory and a relatively weak presence of educators in the research literature.

The arrival of generative AI has substantially changed this landscape. The public release of ChatGPT in late 2022 transformed AI from a relatively specialized educational technology into a widely accessible tool capable of generating text, explanations, questions, lesson ideas, summaries, examples, computer code and other forms of educational content. UNESCO observed that the rapid development of publicly available GenAI was occurring faster than the development of regulatory frameworks and institutional preparedness, thereby requiring a human-centred approach to its educational use.

The educational implications are profound. AI can potentially help teachers differentiate instruction, provide formative feedback, generate learning resources and analyse student performance. Students can use AI as a conversational tutor, writing assistant, brainstorming partner, language-support tool and source of alternative explanations. However, the same technology can produce inaccurate information, reinforce bias, compromise privacy, facilitate academic dishonesty and encourage students to outsource cognitive effort.

The central issue, therefore, is not whether AI should enter education. It has already entered educational systems. The more important question is how AI can be integrated into pedagogically meaningful, ethically responsible and human-centred educational practices. This review examines that question by analysing the emerging relationship between AI and pedagogical innovation.

2. Conceptualizing Artificial Intelligence in Education

Artificial Intelligence refers broadly to computational systems capable of performing tasks associated with human cognitive processes, including learning, reasoning, prediction, language processing, pattern recognition and decision-making. In educational settings, AI encompasses a diverse family of technologies rather than a single technological system.

AI in education can include machine-learning algorithms, intelligent tutoring systems, adaptive learning platforms, automated assessment, recommendation systems, learning analytics, natural-language processing, computer vision, speech recognition, generative AI and large language models.

The pedagogical significance of these technologies lies in their ability to alter relationships among the learner, teacher, content and learning environment. Traditional instructional systems tend to provide relatively standardized content and activities to groups of learners. AI-supported environments can potentially modify content, sequence, feedback and difficulty according to learner characteristics and performance.

Generative AI introduces another dimension because it can produce new educational artefacts

rather than merely classify or predict learner behaviour. Large language models can generate explanations, examples, questions, summaries and feedback in response to natural-language prompts. Kasneci et al. (2023) argued that large language models can support educational content creation, interaction, engagement and personalized learning, while simultaneously requiring new forms of AI literacy, critical thinking and fact-checking. Thus, AI should be understood not merely as an instructional tool but as a pedagogical infrastructure capable of influencing how educational experiences are designed.

3. Evolution from Educational Technology to AI-Enabled Pedagogy

The development of AI-enabled pedagogy can be understood as a progression through several stages. The first stage involved computer-assisted instruction, in which computers delivered predetermined instructional materials and exercises. The second stage introduced intelligent tutoring and adaptive systems capable of responding to learner performance. The third stage involved learning analytics and predictive systems that used educational data to identify patterns, predict performance and support institutional decision-making. The fourth and current stage is characterized by generative and conversational AI. Unlike earlier systems, generative AI allows learners and teachers to interact with AI using natural language and receive dynamically generated responses.

This transition represents a movement from technology-mediated instruction toward technology-supported pedagogical dialogue. Recent systematic reviews demonstrate the rapid expansion of research in this area. Yusuf et al. (2024) mapped 407 publications on generative AI in education and research and identified major themes including applications and impacts, ethical implications, perspectives and experiences, adoption, performance and intelligence. Their review also conceptualized GenAI as a tool for pedagogical enhancement, professional development, writing assistance, productivity and interdisciplinary learning. This rapid expansion indicates that AI is no longer being investigated exclusively as a technical innovation. Increasingly, researchers are examining how it can be integrated into pedagogical processes.

4. AI as a Catalyst for Pedagogical Innovation

Pedagogical innovation refers to meaningful changes in teaching and learning practices designed to improve educational processes and outcomes. AI can support pedagogical innovation by expanding teachers' capacity to design differentiated, interactive, adaptive and data-informed learning experiences.

However, technological adoption does not automatically constitute pedagogical innovation. Simply asking students to use ChatGPT for an assignment is not necessarily innovative pedagogy. Genuine innovation occurs when AI enables learning experiences that are more personalized, inquiry-oriented, collaborative, reflective, creative or authentic than conventional approaches. The literature suggests several major areas of pedagogical transformation.

4.1 Personalized and Adaptive Learning

One of the most established applications of AI in education is personalized learning. AI systems can analyse learner performance and recommend activities, resources or learning pathways based on individual needs.

Adaptive learning systems can modify the difficulty, sequence or type of instructional material in response to learner performance. This can potentially address one of the central limitations of mass education: the assumption that learners in the same classroom require identical instructional experiences.

A systematic review by Bayly-Castaneda et al. (2024), examining 78 studies published between 2019 and 2024, found that research on AI-mediated personalized learning was predominantly situated in higher education and that adaptive learning technologies remained prominent, while interest in generative language models was increasing.

Personalization may involve: adaptive content sequencing; individualized practice activities; personalized explanations; automated feedback; learning-resource recommendations; early identification of learning difficulties; and personalized learning pathways.

Nevertheless, personalization should not be equated with algorithmic individualization alone. Meaningful personalization requires consideration of learners' interests, cultural contexts, social relationships, motivations and developmental needs. Therefore, the appropriate pedagogical principle is personalization with human interpretation, rather than personalization through algorithmic automation alone.

5. AI-Supported Intelligent Tutoring

Intelligent Tutoring Systems (ITS) represent one of the earliest and most developed applications of AI in education. These systems attempt to reproduce selected functions of human tutoring by diagnosing learner performance, providing explanations, presenting tasks and adapting instructional sequences.

Traditional classroom instruction is constrained by teacher workload. A teacher may have limited time to provide individualized feedback to every learner. AI-based tutoring systems can potentially provide immediate assistance outside normal classroom hours.

Generative AI has expanded the possibilities of intelligent tutoring because students can interact conversationally rather than selecting from predetermined options. A learner can request an alternative explanation, ask for an example, identify a misconception or request progressively more difficult questions.

The pedagogical value of conversational tutoring, however, depends upon the quality of interaction. If AI simply provides answers, it may reduce cognitive effort. If it asks probing questions, offers scaffolding and encourages students to explain their reasoning, it can potentially promote deeper learning. Thus, the distinction between AI as answer provider and AI as cognitive scaffold is pedagogically important.

6. AI and Constructivist Learning

Constructivist theories emphasize active knowledge construction rather than passive reception. From this perspective, AI can support constructivist pedagogy when learners use it to investigate problems, compare explanations, test ideas and construct knowledge.

For example, instead of asking an AI system to write an essay, a teacher might ask students to:

1. formulate an initial argument;
2. generate an AI response;
3. identify factual weaknesses;
4. compare the AI response with scholarly sources;

5. revise their argument;
6. justify the revisions; and
7. reflect on the limitations of AI.

Such a design transforms AI from a substitute for student thinking into an object and instrument of critical inquiry. This approach is consistent with recommendations that AI integration should emphasize critical thinking and fact-checking rather than uncritical dependence on AI-generated responses. AI can therefore contribute to constructivist learning when it is embedded within activities involving questioning, verification, comparison, reflection and knowledge construction.

7. AI and Inquiry-Based Learning

Inquiry-based learning requires students to formulate questions, investigate evidence, develop explanations and communicate conclusions. Generative AI can function as a starting point for inquiry by helping students generate research questions, identify alternative perspectives or simulate different viewpoints. However, AI-generated information should itself become an object of investigation.

For example, students studying environmental education may ask an AI system to explain climate change. They can subsequently compare the response with scientific reports and peer-reviewed literature, identify omissions and inaccuracies, and construct a revised evidence-based explanation.

Such activities promote an important contemporary competence: AI-mediated information literacy. In the emerging educational environment, students must not only know how to obtain information but also evaluate how information is generated, verify its reliability and recognize the limitations of algorithmically produced content.

8. AI and Collaborative Learning

At first glance, AI may appear to encourage individual rather than collaborative learning. However, pedagogically designed AI activities can support collaboration.

Groups can use AI to generate competing solutions to a problem and then critically evaluate them. Students can assign different roles to members of a group, such as evidence verifier, argument evaluator, ethical critic and content developer.

AI can therefore become a collaborative intellectual resource rather than a replacement for peer interaction. The teacher's responsibility is to ensure that AI does not eliminate the social dimension of learning. Human dialogue, negotiation, empathy, communication and collective problem-solving remain essential educational outcomes.

9. AI and Differentiated Instruction

Differentiated instruction requires teachers to respond to differences in learners' readiness, interests and learning needs. AI can support differentiation by rapidly generating multiple versions of instructional materials.

A teacher can potentially request: a simplified explanation for learners requiring additional support; an advanced explanation for high-achieving learners; examples connected to local contexts; multilingual explanations; practice questions at different cognitive levels; and alternative representations of difficult concepts.

This may reduce some of the preparation burden associated with differentiated instruction.

Nevertheless, teachers must evaluate AI-generated resources before classroom use. AI-generated content can contain factual inaccuracies, cultural assumptions or inappropriate levels of complexity. Consequently, AI should be considered a teacher productivity and differentiation assistant, not an autonomous curriculum designer.

10. AI and Feedback

Feedback is a central component of formative assessment. Effective feedback helps learners understand where they are, where they need to go and how to improve. AI can provide rapid feedback on writing, problem-solving, language use and other forms of student work. This creates opportunities for iterative learning in which students revise their work multiple times.

However, automated feedback may be superficial if it focuses primarily on grammatical correctness or surface-level features. Educationally valuable feedback should address reasoning, conceptual understanding, argument quality and disciplinary standards.

A productive model is therefore:

Student work → AI-supported feedback → Student interpretation → Revision → Teacher feedback → Reflection

Rather than: Student work → AI correction → final answer

The first model preserves learner agency and encourages metacognition.

11. AI and Creativity

One of the most debated questions concerns whether generative AI enhances or undermines creativity.

AI can support divergent thinking by producing multiple possibilities, examples, analogies and alternative approaches. Students can use AI for brainstorming, scenario generation and design ideation. However, creativity requires more than producing many outputs. It involves originality, judgement, contextual relevance and purposeful transformation.

If students accept AI-generated ideas without modification, AI may produce homogenization rather than creativity. Therefore, teachers should require learners to explain: what the AI generated; which ideas they accepted; which ideas they rejected; why they modified particular suggestions; and what original contribution they made. The pedagogical objective should be creative augmentation, not creative substitution.

12. AI and Higher-Order Thinking

A major concern surrounding AI is its potential influence on higher-order cognitive skills. If students routinely use AI to generate answers, summarize readings or complete assignments, they may reduce opportunities for independent reasoning. On the other hand, carefully designed AI-mediated activities can require students to evaluate, critique, synthesize and improve AI-generated material.

Recent experimental evidence provides encouraging but qualified findings. Deng et al. (2024) conducted a systematic review and meta-analysis of 69 experimental studies and reported that ChatGPT interventions were associated with improvements in academic performance, affective-motivational states and higher-order thinking propensities. However, the authors also identified methodological limitations and called for stronger assessments, longitudinal research and objective measures of higher-order thinking.

This finding suggests that the educational impact of AI is not determined simply by whether

students use it. Rather, the design of the learning activity determines whether AI supports or replaces higher-order thinking.

13. AI and Assessment Innovation

Assessment is perhaps the area most significantly disrupted by generative AI. Traditional take-home essays and conventional written assignments can increasingly be completed with AI assistance. Consequently, educators must reconsider the relationship between assessment and learning.

AI creates an opportunity to shift from predominantly product-oriented assessment toward process-oriented and authentic assessment.

Potential assessment innovations include: oral examinations; project-based assessment; portfolios; demonstrations; reflective journals; viva voce examinations; classroom-based problem solving; iterative drafts; process documentation; AI-use disclosure statements; and evaluation of students' ability to critique AI-generated content.

The objective should not be to create an endless technological competition between AI generation and AI detection. Instead, assessment should focus on competencies that require meaningful learner participation.

A student's ability to explain, defend, apply, critique and transfer knowledge becomes increasingly important.

14. AI, Academic Integrity and Assessment Validity

Generative AI has created significant challenges for academic integrity. Students can potentially use AI to generate essays, answer questions or complete assignments without demonstrating the intended learning outcomes.

A recent systematic review of GenAI and academic integrity in higher education identified both educational opportunities and risks, particularly concerning academic dishonesty, while emphasizing the need for AI literacy, responsible use and institutional policies.

However, the problem should not be reduced to cheating.

The emergence of generative AI challenges educators to reconsider what constitutes authentic academic work. If an assessment can be completed successfully without the student possessing the intended knowledge or skill, the assessment itself may require redesign. Thus, AI creates not merely an integrity problem, but an assessment design problem.

15. Transformation of the Teacher's Role

One of the most important pedagogical implications of AI concerns the changing role of teachers. Early discussions sometimes presented AI as a potential replacement for teachers. Contemporary educational perspectives increasingly emphasize augmentation rather than replacement. UNESCO's guidance promotes a human-centred approach to GenAI, emphasizing human agency, ethical safeguards, privacy, inclusion and pedagogical validation.

The teacher's role is likely to evolve from primarily transmitting information toward: learning designer; facilitator; mentor; discussion leader; evaluator; ethical guide; learning diagnostician; AI-literacy educator; and curator of reliable knowledge.

AI may be capable of producing explanations, but teachers understand learners within social and cultural contexts. Teachers recognize emotional needs, classroom relationships, motivation, developmental differences and ethical considerations. Therefore, AI may automate

selected tasks, but it cannot simply automate the professional identity of the teacher.

16. AI and Teacher Professional Development

Successful AI integration requires substantial teacher professional development. Teachers need more than technical training. They require pedagogical AI literacy.

Such literacy should include understanding:

1. fundamental AI concepts;
2. capabilities and limitations of generative AI;
3. prompt design;
4. AI-supported instructional planning;
5. AI-supported assessment;
6. data privacy;
7. algorithmic bias;
8. academic integrity;
9. copyright and intellectual property;
10. responsible AI use; and
11. methods for evaluating AI-generated educational resources.

UNESCO has developed AI competency frameworks for both teachers and students, reflecting the growing recognition that AI literacy must become part of educational capacity-building. Professional development should therefore move beyond workshops on "how to use ChatGPT" toward sustained development of AI-informed pedagogical judgement.

17. AI, Inclusion and Equity

AI has significant potential for inclusive education. Speech recognition, text-to-speech, translation, adaptive interfaces, automated captioning and personalized content can support learners with diverse needs. AI may also help reduce language barriers by providing explanations and translations in multiple languages. However, AI can simultaneously reproduce or intensify educational inequalities. Students with better devices, connectivity, digital literacy and access to premium AI systems may gain advantages over students without those resources. Algorithmic bias is another concern. AI systems are trained on data that may inadequately represent particular linguistic, cultural or social groups.

Therefore, AI-enabled inclusion requires attention to: affordability; accessibility; multilingualism; culturally responsive content; assistive technologies; disability inclusion; digital infrastructure; and algorithmic fairness. UNESCO specifically identifies inclusion, equity, gender equality, linguistic and cultural diversity and human agency as issues that must be protected in the educational use of GenAI.

18. Major Findings from the Reviewed Literature

The review indicates several broad patterns.

1. AI has moved from specialized intelligent tutoring and adaptive systems toward mainstream generative and conversational applications.
2. Personalization remains one of the strongest educational applications of AI. However, effective personalization requires human interpretation and contextual sensitivity.
3. Recent evidence indicates potential positive effects of ChatGPT-supported interventions on academic performance, affective-motivational outcomes and higher-

order thinking, although methodological limitations mean that these findings should not be interpreted as proof that unrestricted AI use improves learning.

4. The literature increasingly recognizes that AI creates significant ethical, academic-integrity and equity challenges.
5. Systematic reviews continue to identify gaps in empirical evidence, particularly concerning long-term effects, school education, cultural contexts and theoretically grounded pedagogical applications. Yusuf et al. (2024), for example, identified limited K–12 research and limited experimental evidence in the GenAI literature.
6. Teacher preparation remains critical. Earlier AIEd research was dominated by technical disciplines and often insufficiently connected with pedagogical theory, suggesting that educational researchers and teacher educators must play a stronger role in shaping AI adoption.

19. Implications for Teachers

1. Teachers should not approach AI simply as a technological competency. They should develop the capacity to make pedagogical decisions about when, why and how AI should be used.
2. Teacher education programmes should include AI-supported lesson planning, AI literacy, assessment redesign, prompt literacy, verification of AI-generated content, academic integrity, data ethics and inclusive AI practices.
3. Teachers should also model responsible AI use. Rather than banning AI completely or allowing unrestricted use, educators can establish transparent classroom norms concerning acceptable and unacceptable uses.
4. Most importantly, teachers should retain professional judgement over curriculum, pedagogy, assessment and student welfare.

20. Implications for Teacher Education Institutions

Teacher education institutions have a particularly important role because today's student teachers will become tomorrow's mediators of AI-enabled learning.

Teacher education curricula should therefore incorporate AI across multiple areas rather than treating AI as an isolated elective.

For example:

Educational Psychology: AI, cognition and learner autonomy.

Educational Technology: AI tools and instructional design.

Assessment: AI-supported formative assessment and authentic assessment.

Inclusive Education: AI-supported accessibility.

Research Methodology: AI-assisted research alongside research ethics.

Professional Development: AI competency and lifelong learning.

Educational Management: AI governance and institutional policy.

This multidisciplinary integration can prepare future teachers for educational environments in which AI is increasingly embedded.

21. Implications for Educational Policy

Educational policy should establish a balance between innovation and protection.

Institutions require clear guidelines concerning privacy, academic integrity, intellectual

property, age-appropriate AI use, accessibility and responsible implementation.

However, excessive regulation may prevent beneficial experimentation. Policies should therefore be sufficiently flexible to accommodate technological change.

UNESCO recommends coherent policy frameworks based on human-centred principles, while the U.S. Department of Education similarly emphasizes human capacity and responsible integration in its discussion of AI and the future of teaching and learning.

For India, AI policy should additionally address multilingualism, regional diversity, infrastructure disparities and the professional development of teachers.

22. Research Gaps and Future Directions

The existing literature provides strong evidence of rapid research growth, but several important gaps remain.

1. More longitudinal studies are required. Many current studies examine short-term interventions, whereas the effects of sustained AI use on learning habits, motivation and cognitive development remain insufficiently understood.
2. More research is required at the school level. Recent systematic mapping indicates that K–12 research remains comparatively limited.
3. Future studies should investigate AI use across diverse cultural and linguistic contexts. Much of the current literature is concentrated in technologically developed settings.
4. Stronger experimental designs are needed. Future studies should include adequate sample sizes, control groups, validated instruments and objective learning outcomes.
5. Research should examine teacher-AI collaboration rather than focusing exclusively on student use.
6. Assessment research must explore new models capable of evaluating learning in an environment where generative AI is readily available.
7. Greater attention should be given to student well-being, cognitive dependence, digital fatigue and the psychological effects of continuous AI interaction.
8. Future research should move beyond the question of whether AI "works" toward the more meaningful question:

23. Conclusion

Artificial Intelligence is reshaping the educational landscape by introducing new possibilities for personalization, intelligent tutoring, feedback, content creation, assessment, learning analytics and collaborative inquiry. The emerging evidence indicates that AI can contribute positively to learning when it is deliberately integrated into well-designed pedagogical practices. However, AI should not be viewed as an autonomous solution to educational challenges. The quality of AI-enabled education ultimately depends upon curriculum design, teacher expertise, learner agency, institutional policy and ethical governance. The most significant pedagogical transformation is therefore not the replacement of teachers by AI but the emergence of a new form of human-AI educational partnership. Teachers may increasingly use AI to reduce routine workload, generate instructional alternatives, analyse learning data and provide differentiated support. Students may use AI as a tutor, brainstorming partner, feedback mechanism and inquiry resource. Yet human beings must continue to determine educational purposes, evaluate knowledge, exercise judgement and cultivate values. The

future of education should consequently not be framed as AI versus teachers. The more productive question is how teachers, learners and AI can work together to create richer, more inclusive, intellectually demanding and ethically responsible learning environments. A human-centred approach is particularly important because the ultimate purpose of education extends beyond information acquisition. Education develops judgement, creativity, empathy, critical thinking, social responsibility, ethical reasoning and the capacity to participate meaningfully in society. AI can support these purposes, but it cannot define them.

A SYSTEMATIC REVIEW OF GENERATIVE ARTIFICIAL INTELLIGENCE TOOLS IN EDUCATION

Dr Pradeep Kumar T.
Guest Faculty, Department of Education, Bangalore University, Bangalore, Karnataka,
E-mail: drpradeepkumart@yahoo.com

Abstract

Generative Artificial Intelligence (GenAI) has rapidly emerged as a significant technological development in education, particularly following the public release of ChatGPT in late 2022. Tools based on large language models and multimodal generative systems are increasingly being used for tutoring, content generation, feedback, assessment support, language learning, lesson planning, programming, research assistance, and personalized learning. This systematic review synthesizes recent research on the applications, educational benefits, limitations, ethical issues, and implementation requirements associated with generative artificial intelligence tools in education. The review draws particularly on systematic reviews and meta-analyses published since the emergence of contemporary GenAI tools, including research examining ChatGPT, broader GenAI applications, higher education, K–12 education, and student learning outcomes. Existing evidence indicates that GenAI can support academic performance, motivation, higher-order thinking, accessibility, feedback, and teaching productivity when integrated through appropriate pedagogical scaffolding. The review argues that educational value depends less on the mere availability of GenAI tools than on how they are pedagogically designed, supervised, evaluated, and embedded within curriculum and assessment. A human-centred approach involving AI literacy, transparent institutional policies, privacy protection, teacher professional development, assessment redesign, and continuous evaluation is therefore recommended.

Keywords: *ChatGPT; artificial intelligence in education; systematic review; AI literacy; personalized learning*

Introduction

Artificial Intelligence (AI) has progressively transformed educational technologies, but the emergence of generative artificial intelligence represents a particularly significant development. Unlike conventional educational AI systems that primarily classify, predict, recommend, or automate predefined processes, GenAI systems can generate new text, images, computer code, audio, video, and other forms of content in response to natural-language instructions. The release of ChatGPT in 2022 substantially lowered the technical barrier to interacting with large language models and accelerated the adoption of generative AI within educational contexts. Recent research consequently describes GenAI as a technology with potentially transformative implications for teaching, learning, assessment, and academic work.

Background of the study

Generative Artificial Intelligence in Education

GenAI refers to computational systems capable of producing novel content based on patterns learned from large datasets. In education, the most visible applications have involved large language models, but the broader GenAI ecosystem includes text, image, audio, video, code, and multimodal generation.

The educational significance of these technologies lies not simply in their ability to generate content but in their capacity to interact with learners and teachers through conversational interfaces. This creates opportunities for individualized explanations, iterative feedback, dialogue-based learning, and rapid content creation.

Major Categories of Educational GenAI Tools

The literature can broadly categorize GenAI tools according to their principal educational functions:

Category	Educational applications
Conversational/LLM tools	**Tutoring, explanations, brainstorming, question answering**
Writing-generation tools	**Drafting, editing, summarization, paraphrasing**
AI feedback tools	**Formative feedback, language correction, revision support**
Image-generation tools	**Visual learning materials, illustrations, design projects**
Code-generation tools	**Programming assistance, debugging, code explanation**
Presentation/content tools	**Lesson materials, slides, instructional resources**
Multimodal GenAI	**Text-image interaction, visual analysis, multimedia learning**
Research-oriented tools	**Literature discovery, summarization, research assistance**
Language-learning tools	**Conversation practice, translation, vocabulary and writing support**

Importantly, the educational effectiveness of these categories depends on instructional context. A tool used as an unsupervised replacement for student reasoning may have very different consequences from the same tool used as a scaffold followed by independent performance.

Objectives of the study:

- To synthesize the emerging evidence concerning generative artificial intelligence tools in education
- To identify the benefits and challenges of Generative artificial intelligence tools in learning outcomes.

Literature Review:

Deng et al. (2025) conducted a systematic review and meta-analysis of experimental studies examining whether ChatGPT improves student learning. The researchers identified **69 studies published between 2022 and 2024**. The studies were predominantly conducted at the university level and covered several subject areas, with language education receiving considerable attention. The findings showed that ChatGPT interventions generally improved **academic performance, affective-motivational outcomes, and higher-order-thinking propensities**. However, ChatGPT also reduced students' mental effort, while no significant effect was found on self-efficacy. The researchers emphasized the need for longer-term studies, objective measures of higher-order thinking, adequate sample sizes, and assessments that require students to demonstrate skills rather than simply produce answers. This study is highly relevant because it provides experimental evidence rather than relying solely on students' perceptions of GenAI.

Chen and Cheung (2025) conducted a systematic review and meta-analysis examining the effects of GenAI on university students' learning outcomes. Their findings indicate that GenAI

can positively influence **language skills, academic achievement, affective-motivational outcomes, and higher-order thinking**. However, the study found no significant overall effect on metacognition. The researcher also examined contextual factors influencing GenAI's effectiveness. The findings are significant to the present study because they demonstrate that GenAI may improve several learning outcomes while simultaneously raising questions about students' ability to regulate and monitor their own learning.

Jin and Sercu (2025) systematically reviewed **21 experimental studies** involving ChatGPT interventions in higher education. Their review found that research was concentrated particularly in **language and STEM disciplines**. Two broad intervention types were identified: **task assistance** and **general learning support**. ChatGPT was generally effective in supporting knowledge acquisition, but its effects on skills development were more variable. Interestingly, medium-term interventions produced more promising results, whereas short-term effects were limited and long-term outcomes were mixed. This study suggests that the duration and design of an AI-supported intervention may be important determinants of educational effectiveness.

Chen et al. (2025) conducted a systematic review and meta-analysis examined the effect of ChatGPT on student engagement. The researchers screened 766 articles and included 17 empirical studies involving 1,735 students. The findings indicated a medium overall effect of ChatGPT-based learning on student engagement. Positive effects were identified across behavioral, cognitive, and emotional engagement, with the strongest effect reported for cognitive engagement. The study identified personalized tutoring, programming and technical assistance, and content generation/collaboration as important mechanisms through which ChatGPT can support engagement. At the same time, the researchers noted the risk of disengagement associated with over-reliance on AI. This study supports the argument that GenAI may influence not only academic achievement but also students' participation and engagement in learning.

GenAI in Pedagogical Practices (2025) A systematic review of empirical studies published between 2022 and 2024 examined how GenAI is being incorporated into pedagogical practices. The review analyzed 28 empirical studies published in high-impact journals indexed in Web of Science. The study found that GenAI can improve instructional efficiency, personalized learning, feedback, learner engagement, motivation, idea generation, critical thinking, and problem-solving. At the same time, the review identified challenges associated with the responsible integration of GenAI into teaching and learning. This research is particularly relevant to the applications and benefits components of the proposed systematic review.

Research Methodology:

The study adopts a descriptive research design to explore the significance, benefits and challenges of generative artificial intelligence tools in education. The approach is qualitative, utilizing content analysis to review existing literature on the topic. Key aspects of the methodology include.

Data Collection: Secondary data were sourced from peer-reviewed journal articles, academic publications and reputable online databases, studies published in 2005were prioritized to

ensure relevance and recency.

Analysis Process: A content analysis framework was employed to identify recurring themes, insights, and trends in the reviewed literature. The data were categorized into thematic areas such as tools, benefits, challenges and pedagogical implications.

Scope of the study: The research focuses on generative artificial intelligence tools in education used in diverse contexts, including higher education. Both qualitative and quantitative aspects of previous studies were examined to provide a holistic understanding.

Limitations: As the study relies on secondary data, findings are interpretative and dependent on the quality of reviewed literature. The absence of primary data collection limits the scope for contextual insights.

Findings of the study: From the literature review it can be analyzed that:

Recent systematic reviews indicate that research on GenAI in education has expanded extremely rapidly since 2022. However, the evidence base is unevenly distributed. Higher education represents the dominant research setting. A 2025 systematic review of ChatGPT research reported that approximately 69.7% of the reviewed studies were conducted in higher education, whereas primary and secondary education represented substantially smaller proportions. This concentration is important because findings from university students cannot automatically be generalized to younger learners. K–12 education involves different developmental characteristics, curriculum structures, teacher responsibilities, parental considerations, privacy requirements, and safeguarding issues.

- GenAI can provide conversational explanations adapted to learners' questions and apparent needs. Students can request alternative explanations, examples, summaries, practice questions, or step-by-step guidance. This creates the possibility of individualized learning at a scale that conventional teacher-only models may find difficult to achieve.
- Writing support is one of the most frequently reported applications. GenAI can help students brainstorm ideas, identify grammatical problems, reorganize arguments, translate passages, and receive iterative feedback.
- GenAI can generate rapid formative feedback on drafts, responses, code, and other student work. Its scalability is particularly attractive in large classes.
- Teachers can use GenAI to create lesson outlines, examples, discussion questions, quizzes, rubrics, scenarios, and differentiated instructional materials. This may reduce preparation time and enable teachers to experiment with multiple instructional approaches.
- Code-generation tools can explain programming concepts, generate sample code, identify errors, and provide debugging suggestions. Such tools can function as interactive programming assistants.

Conclusions & Suggestions:

The findings indicate that GenAI represents neither an inherently beneficial nor inherently harmful educational technology. Its educational consequences are strongly mediated by instructional design, assessment practices, learner characteristics, teacher competence, institutional policies, and the characteristics of the AI system itself. One of the clearest patterns in the literature is the importance of pedagogical scaffolding. GenAI appears most

educationally valuable when it supports rather than replaces cognitive activity. The current evidence also reveals an imbalance between enthusiasm for technological capabilities and evidence concerning long-term educational effects. Recent systematic reviews consistently demonstrate that universities dominate the evidence base. Research involving younger learners is comparatively limited, despite the importance of developmental, safeguarding, and age-appropriate considerations. Generative artificial intelligence is rapidly changing the educational landscape. The literature reviewed in this study indicates substantial potential for GenAI to support personalized learning, tutoring, writing, language development, feedback, programming, instructional-material creation, and teacher productivity. Recent systematic reviews and meta-analyses provide evidence of positive effects on several learning-related outcomes, including academic performance, motivation, language skills, and higher-order-thinking propensities. Nevertheless, GenAI should not be treated as an automatic solution to educational challenges. Risks involving hallucinations, academic integrity, over-reliance, bias, privacy, inequitable access, and insufficient teacher preparation remain significant. Furthermore, current research is disproportionately concentrated in higher education and frequently relies on short-term interventions. The central conclusion of this review is therefore that **the educational value of GenAI depends primarily on the quality of its pedagogical integration rather than on the sophistication of the technology alone**. GenAI should augment human teaching and learning rather than replace human judgment. Effective implementation requires AI literacy, pedagogical scaffolding, assessment redesign, teacher development, ethical governance, privacy protection, and continuous evaluation.

ARTIFICIAL INTELLIGENCE AND PEDAGOGICAL INNOVATIONS IN EDUCATION: A SYSTEMATIC LITERATURE REVIEW AND SYNTHESIS OF RESEARCH EVIDENCE

Dr. Pradeep Kumar T
Guest faculty, Department of Education Bangalore University, Bangalore
Dr. Prajnya Sarangi
Teacher Educator, Sathya Educare Competency Trust Bangalore

Abstract

Artificial Intelligence (AI) is becoming increasingly visible in education, influencing lesson planning, teaching, assessment and student support. The emergence of Generative Artificial Intelligence (GenAI) has accelerated this change because teachers and learners can now use AI to generate explanations, questions, examples, and feedback and learning resources. This systematic literature review examines how AI contributes to pedagogical innovation and what recent research reveals about its effects on teaching and learning. Literature published mainly between 2019 and 2026, including systematic reviews, meta-analyses and empirical studies, was examined. Particular attention was given to personalized learning, assessment, feedback, engagement, higher-order thinking and teacher roles. The evidence generally shows positive effects of AI-supported learning on academic achievement, motivation, engagement and higher-order thinking. However, these benefits are not automatic. Outcomes depend on pedagogical design, teacher involvement, learner characteristics, and type of AI application and duration of use. The review also identifies concerns related to accuracy, academic integrity, privacy, bias, overdependence and unequal access. The study concludes that AI is most valuable when it strengthens sound pedagogy rather than replaces it. Meaningful innovation depends on teachers using AI purposefully to create active, reflective, collaborative and personalized learning experiences.

Keywords: *Artificial Intelligence, Generative AI, pedagogical innovation, AI in education, personalized learning, higher-order thinking, and teacher education*

1. Introduction

Education has continually changed alongside technological developments. Artificial Intelligence is now becoming another significant influence on teaching and learning. Unlike earlier digital tools that mainly provided access to information, contemporary AI systems can interact with learners, generate content and respond to individual questions.Generative AI has made this change particularly visible. Teachers can use AI to prepare lesson ideas, questions, examples, activities and feedback, while students can use it to clarify concepts, brainstorm and explore alternative explanations. These possibilities are promising, but they also raise concerns about inaccurate information, student dependence, academic integrity and privacy.More importantly, using AI does not automatically mean that pedagogy has changed. A teacher who asks AI to produce a conventional worksheet is using new technology, but the learning process may remain traditional. Pedagogical innovation occurs when AI contributes

to meaningful changes in how learners think, collaborate, investigate, solve problems or reflect on their learning.This review therefore examines not only whether AI is effective, but how it is being used, what outcomes are associated with it and what conditions make its use educationally meaningful.

2. Need of the Study

Research on AI in education is expanding rapidly, but the evidence is spread across different educational levels, subjects, technologies and outcomes. This makes it difficult for teachers and institutions to understand the broader picture.The need for this review arises from four concerns. First, AI is developing faster than many educational systems can respond. Second, AI is being used for very different purposes, including tutoring, assessment, personalization and content generation. Third, technological adoption should not be confused with pedagogical innovation. Finally, teachers remain responsible for deciding how AI should be used and for ensuring that technology serves learning rather than replacing it.A systematic review can bring these strands together, identify common findings and highlight areas where evidence is still limited.

3. Review of Related Literature

3.1 AI in Education

AI has been used in education for several decades through intelligent tutoring systems, adaptive learning, automated assessment and learning analytics. Bond et al. (2024), reviewing 66 systematic reviews in higher education, identified personalization, adaptive systems, learner profiling and prediction as important research areas. Generative AI has expanded these possibilities by allowing more natural interaction between learners and AI.

3.2 Generative AI and Pedagogical Innovation

Generative AI can produce explanations, examples, questions and learning materials. Yusuf et al. (2024), in a systematic mapping review of 407 publications, identified pedagogical enhancement, adoption, performance and ethical concerns as major themes. The educational value of GenAI depends on the learning task. If students simply copy answers, learning may become passive. If they analyse and improve AI responses, the same technology can support deeper thinking.

3.3 AI and Personalized Learning

AI can provide different explanations, examples and levels of support according to learner needs. A student struggling with a concept may request a simpler explanation, while another may explore a more challenging application. However, meaningful personalization requires teacher judgement. AI can offer options, but teachers must decide what support is appropriate.

3.4 AI and Assessment

AI can help generate questions, suggest feedback and support formative assessment. At the same time, GenAI challenges conventional assignments because students can use it to produce essays and answers. This creates an opportunity to use more authentic assessment, including projects, oral explanations, portfolios, demonstrations and reflective tasks that reveal how students think and apply knowledge.

3.5 AI and Higher-Order Thinking

AI can either reduce or encourage higher-order thinking depending on how it is used. Asking

students to copy an AI response provides little opportunity for analysis. Asking them to identify errors, verify evidence, compare answers and improve an explanation creates richer cognitive engagement. Chen and Cheung (2025) found a positive effect of GenAI on higher-order thinking, although evidence for metacognition was less conclusive.

3.6 AI in K–12 Education

Liu and Zhong (2024), reviewing 45 empirical K–12 studies, highlighted experiential learning, group learning, authentic contexts, teacher involvement and scaffolding. Díaz and Nussbaum (2024), reviewing 183 papers, observed that many AI applications in K–12 education still rely on established pedagogical approaches. This shows that AI does not automatically create a new pedagogy.

3.7 AI in Science Education

Science education offers opportunities for AI-supported inquiry. Students can use AI to generate questions, compare explanations and explore possible solutions. Almasri (2024), reviewing 74 empirical studies, found applications involving learning environments, assessment, quiz generation and prediction. The value of AI depends on whether it supports inquiry and reasoning rather than simply supplying answers.

4. Objectives

The study aims to:

- examine recent research on AI and pedagogical innovation;
- identify major applications of AI in teaching and learning;
- examine its influence on student learning outcomes;
- identify pedagogical approaches associated with effective AI use;
- examine changing teacher roles; and
- Identify challenges, implications and research gaps.

5. Research Questions

- How is AI being used to support pedagogical innovation?
- What impact does AI have on student learning outcomes?
- Which pedagogical approaches work effectively with AI?
- How is AI changing the teacher's role?
- What challenges and research gaps remain?

6. Methodology

A **Systematic Literature Review (SLR)** was conducted using research published mainly between 2019 and 2026. Literature was identified through Scopus, Web of Science, ERIC, ScienceDirect, SpringerLink, Wiley Online Library and Google Scholar. Search terms included "Artificial Intelligence and education," "AI and pedagogy," "Generative AI and teaching," "ChatGPT and learning outcomes," "AI and personalized learning," and "AI and assessment."

Studies were included when they examined AI or GenAI in educational settings and addressed teaching, learning, assessment or pedagogy. Peer-reviewed empirical studies, systematic reviews and meta-analyses were prioritized. Technical studies without educational application and opinion pieces without an evidence base were excluded.

The selected studies were analysed according to educational level, AI application, and

pedagogical approach, learning outcome, teacher role and major findings. Existing meta-analytic effect sizes were compared descriptively rather than statistically combined because different reviews may contain overlapping primary studies.

7. Data Analysis and Interpretation

Recent quantitative reviews generally show positive effects, although the size of the effect varies.

Study	Evidence	Focus	Main Finding
Bond et al. (2024)	66 reviews	Higher education	Personalization and adaptive learning prominent
Yusuf et al. (2024)	407 publications	GenAI	Pedagogical and ethical issues prominent
Almasri (2024)	74 studies	Science education	AI supported learning and assessment
Liu & Zhong (2024)	45 studies	K–12	Experiential and collaborative learning important
Díaz & Nussbaum (2024)	183 papers	K–12 pedagogy	Established pedagogies remain common
Chen & Cheung (2025)	57 studies	GenAI	Positive effects including higher-order thinking
Liu et al. (2025)	49 studies	GenAI	Positive effects on achievement and motivation
Wu et al. (2026)	35 experiments	ChatGPT	Moderate positive overall effect
Mo et al. (2026)	66 studies	Undergraduate learning	Large positive overall effect

Liu et al. (2025) reported effects of about 0.857 for achievement and 0.803 for motivation. Chen and Cheung (2025) reported an overall effect of approximately $g = 0.804$. Wu et al. (2026) reported $g = 0.670$ in experimental studies involving ChatGPT.These findings are encouraging, but differences between studies show that AI does not have one fixed educational effect. Learners, subjects, intervention duration and instructional design all matter.The most consistent message is that pedagogy should guide technology. AI is more useful when connected to inquiry, collaboration, problem-solving, personalization, formative assessment and reflection.

8. Major Pedagogical Innovations

Several forms of innovation emerge from the literature:

- **Personalized learning:** differentiated explanations and support.
- **AI-supported inquiry:** question generation and exploration.
- **Collaborative learning:** critical discussion of AI responses.
- **Formative assessment:** question generation and feedback.
- **Reflective learning:** evaluation of AI interactions.
- **Authentic learning:** realistic scenarios and problems.

These approaches place AI within the learning process rather than making it the centre of the lesson.

9. Changing Role of the Teacher

AI is changing the teacher's role, but it does not eliminate the need for teachers.

The traditional model can be represented as:

Teacher → Information → Student

An AI-supported model can become:

Teacher → Learning Design → Student + AI → Critical Evaluation → Application

Teachers increasingly act as learning designers, facilitators, mentors, evaluators and ethical guides. AI can generate information, but teachers provide context and judgement. AI can suggest activities, but teachers decide whether they support the intended learning outcomes.

Teacher education therefore needs to develop AI-integrated pedagogical competence rather than only technical skills.

10. Challenges

Accuracy: AI may produce convincing but incorrect information.

Overdependence: Excessive reliance may reduce independent thinking.

Academic Integrity: Conventional assignments may become less reliable.

Privacy: Student and learning data require protection.

Bias: AI outputs may reflect biases in data or system design.

Inequality: Unequal access to devices, connectivity and advanced tools may widen educational gaps.

Teacher Preparedness: Teachers need practical training to use AI meaningfully.

11. Conclusion

The evidence suggests that AI has considerable potential to support pedagogical innovation. Recent research generally reports positive effects on achievement, motivation, engagement and higher-order thinking. However, AI itself does not create innovative education.The strongest benefits appear when teachers use AI to redesign learning experiences rather than simply automate existing practices. AI can support personalization, inquiry, collaboration, feedback and reflection, but these benefits depend on thoughtful instructional design.The teacher therefore remains central. AI can generate content, but teachers provide judgement, context, relationships and values. The future of education should not be framed as teachers versus AI. A more productive approach is teachers working intelligently with AI.

12. Implications

For Teachers

Professional development should include AI literacy, prompt design, lesson planning, differentiated instruction, assessment and verification of AI outputs.

For Teacher Education

Student teachers should experience AI through authentic teaching tasks and reflect on its pedagogical value.

For Curriculum

AI literacy should include evaluating AI responses, identifying inaccuracies, recognising bias and using AI ethically.

For Assessment

Greater emphasis should be placed on application, reasoning, creativity and reflection through

projects, portfolios, demonstrations and oral explanations.

For Institutions

Clear policies should address privacy, academic integrity, accessibility, assessment and responsible AI use.

For Policy

AI strategies should combine infrastructure, teacher capacity, pedagogy, assessment, ethics and equity.

13. Limitations

AI research is changing rapidly, so the evidence base is continually expanding. Existing studies also differ in educational level, subject, AI application, intervention length and methodology.Research is currently stronger in higher education than in primary and secondary education. Many studies are relatively short, so less is known about long-term effects on learner independence, critical thinking and classroom relationships.The present study also synthesizes existing meta-analyses rather than conducting a new statistical meta-analysis because of possible overlap among primary studies.

14. Recommendations for Future Research

Future research should examine:

- long-term AI-supported learning;
- AI use in primary and secondary education;
- teacher professional development;
- collaborative and inquiry-based learning;
- AI and metacognitive development;
- student AI literacy;
- authentic assessment;
- culturally responsive AI pedagogy;
- AI use in low-resource settings;
- student autonomy and AI dependence; and
- ethical and inclusive AI practices.

Researchers should examine not only test scores but also creativity, critical thinking, independence and classroom interaction.

MULTIDISCIPLINARY INTEGRATION OF ARTIFICIAL INTELLIGENCE IN EDUCATION

Dr. M. C. Yarriswamy
Professor & Dean, Department of Education, Bangalore University, Bangalore, E-mail: mcyswamy@gmail.com.
Jagannathan R. Golihalli
Research Scholar, Department of Education, Kitturu Rani Channamma University Belagavi, E-mail: pruthvi.j16@gmail.com

Abstract

Artificial Intelligence (AI) is nowadays so fast that it is radically changing the world of studies. Modern educational AI needs a multidisciplinary approach that integrates cognitive knowledge with science, data analysis, economics, sociology, and ethics, going beyond simple computational automation. To develop "Smart Facilitators "—teachers enabled with the technological aspects, pedagogical knowledge, and ethical and technical skills necessary to navigate and construct a smart future—this article examines how the multidisciplinary integration of AI can be understood and utilized. This study creates a framework for teacher professional development; acquire pedagogical paradigms, by examining how AI interacts with many academic areas. In the end, the article makes the case that an empathetic, An AI-powered collaborative and integrated ecosystem will enhance teacher educators' abilities rather than replace them.

1. Overview

In the 21st century Artificial Intelligence (AI), has evolved from an indepth area of computer science to a pervasive infrastructure giving impact to international economies, cultures, and fundamental institutions, is in the vanguard of this change. Education is the most important aspect of an institution for preparing humanity for a young automated future, but it is also the most vulnerable humanity for an automated future, yet it is also the most susceptible to disruption. In the past, instructional ideas of technology have been incorporated into traditional method (chalk-and-talk) methods as cumbersome supplemental aids. But paradigm shifts Generative AI, machine learning algorithms, and natural language processing (NLP) have brought about a drastic paradigm shift focuses on machine learning algorithms, generative AI, and natural language processing (NLP).AI is evolving tool to active teachers in the instructional strategic plans. The function of the felicitator must be thoroughly reevaluated in light of this systemic and effective change. It is no longer appropriate to say and view teachers as the gatekeepers of information. The idea of the "Smart Facilitator "—a highly adaptive professional who creates individualized learning experiences using cognitive computing, data-driven insights, , and multidisciplinary methodologies will replaces it.

AI concept in education cannot take place in a technical vacuum in order to study properly adapt this change. Now its necessitates a multidisciplinary framework that purposefully links computer science with sociology, ethical philosophy, cognitive psychology, and specific

subject-area pedagogies. This study explores the structural study of multidisciplinary integration give clear path for educate in interdisciplinary integration, providing a clear way for educating and enabling the knowledgeable educators who will create a knowledgeable future with AI

2. The Multidisciplinary Basis of AI in Education

AI must be evaluated using a multidisciplinary concept in order to comprehend how it changes education. The theoretical basis of educational AI systems is the new approach of technological innovation and humanistic idealistic research.

2.1 The Learning Sciences and Cognitive Science

Fundamental goal of both AI development and educational practice is to develop and improve learning strategies. Both machine learning models and traditional classroom teaching practices are informed by the theoretical models of human memory, attention, executive functioning, and metacognition provided by cognitive science. For instance, adaptive educational platforms mainly rely on cognitive load theory to control mental strain and pace lesson delivery, whereas artificial neural networks are loosely built after human biological brain architecture.

Teachers are better able to evaluate AI diagnostics of students learning speed, cognitive barriers, retention timing when they balance this connection. This helps them to combine human idealistic empathy with algorithmic, technical advice. Through the application of working memory and spaced repetition theories to automated metrics, astute educators can comprehend the rationale behind an algorithm's recommendation of a particular review module, transforming an in depth unprocessed technology output into a focused and empathetic learning intervention.

2.2 Cultural Adaptability and Education Sociology

The education is highly social interactive process of getting informed. The use of AI tools takes place in intricate sociocultural systems characterized by institutional, linguistic disparities, prejudices, and digital gap or barriers.

A sociological study of AI in education state said, that data’s are regularly checked for systemic bias. This helps us to prevent AI from repeating past socioeconomic injustices as AI datasets will disadvantage minority students if they only represent the favored group. This happens when study focuses solely on the majority’s thoughts patterns of behavior, cultural need and lag also with the references, and learning habits. To keep fairness and avoid inbuilt, existing inequalities, teacher must critically check AI outputs. They need to know how cultural ideological context shapes or built and judges student behavior.

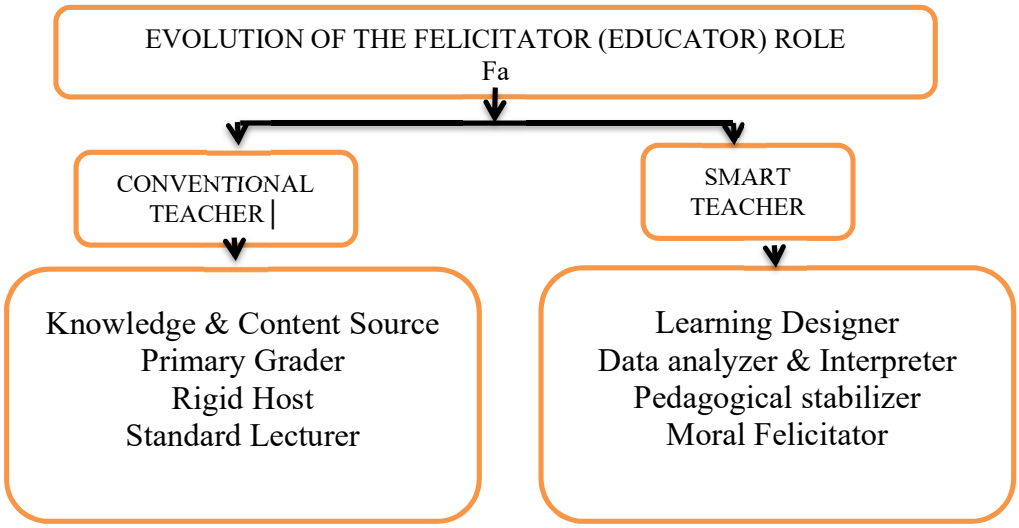
2.3 Data Sovereignty and Ethical Philosophy

Based on fundamental studies of laws of science and ethical philosophy is necessary for integrating AI into the classroom. Data handling, tracking, algorithmic decision-making, and also student privacy must all explicitly adhere to the principles of autonomy, fairness, beneficial, and the ethical obligation to do no harm. Teachers have to balance the moral and social conflicts between student self-identity and computerized continuous monitoring, tracking, or observation of a individual or group. This multidisciplinary integration task helps student data the power, independence and trusted to rule and make decisions without outside interference is maintained and that AI tools help to student’s dignity instead of treating

students like business and resourceful constraints

3. The "Smart Teacher" Concept: Functions and Skills

An emphatic change in the definition of a facilitator is necessary for the integration of AI. The "Smart teacher "or facilitator is an advanced expert working at the true nexus of tech and humans rather than a basic technician who without any proof complies with algorithmic advice.



3.1 The Instructor as the Architect of Learning

The smart teacher becomes a learning architect as adaptive AI platforms handle more and more of the material delivery. They provide inclusive learning environments where AI handles repetitive ideas, chores, including creating scoring simple tests, vocabulary lists, giving primary feedback on studies. This allows the human guide to focus on high-impact activities that computers cannot duplicate, such as directing group ideas, projects, encouraging critical thinking, awareness and conducting in-depth basic seminars. The digital spaces are arranged by the student learners so that automated assistance, evaluation with human contact work hand in hand.

3.2 The Instructor as a Data Interpreter

AI systems produce extremely large size volumes of data, which will show in highly detailed interphase dashboards. Advanced digital literacy study is one of the smart felicitator's basic strength. Teachers must be able to convert visualizations into useful teaching techniques. When an AI dashboard indicates student unable to hold with a particular topic, the instructor must decide whether the difficulty is due to a technical background ,language barrier, a foundational gap, or unclear software terminology in order to select the best human intervention in the study.

3.3 The Instructor as a Moral and Emotional Guide

As automation takes on more technical jobs human-specific talents are becoming more and more important. Intelligent felicitators act as the classroom's pillar. They teach students how to understand, navigate an AI-driven society in an correct and ethical manner while fostering resilience, empathy, open-mindedness, and teamwork. The key factor is that ,how to respect

original human ideas, challenge algorithmic presumptions, assumptions, avoid taking shortcuts in academic journey of study that circumvent critical thinking, and use creative ,critical ,generative AI steps..

4. Theoretical Case Evaluations: Practical AI Paradigms

This part evaluate how key factors of AI educational concepts change instructional workflows and teaching dynamics and strategies in order to anchor these multidisciplinary theories in active classroom practice.

4.1 Cognitive Micro-Scaffolding and Intelligent Tutoring Systems

ICT cognitive modeling is the basic foundation of Intelligent Tutoring Systems (ITS). These skills and methods evaluate each student's step-by-step problem-solving process rather than delivering a standard lecture to a bulk of students. When a student makes a mistake in the middle of a multi-step task, the system offers a customized tip that is intended to correct that particular misconception. And give promising statements.

- **Modification of Conceptual Workflow**

It is no longer necessary for the teacher to demonstrate difficult procedures on a whiteboard for the majority of a class period. Rather, the intelligent system serves hold as a co-teacher by offering technical, consistent, foundational and emotional l practice. The intelligent instructor keeps an eye on the dynamics of the classroom and intervenes when the system identifies a student who is having serious conceptual difficulties that automated solutions are unable to address. As a result, the classroom becomes a highly customized lab setting rather than a homogeneous, one-size-fits-all lecture.

4.2 Macro-Aesthetic Grading and Automated Feedback Assistants

Advanced language processing with grammatically automated feedback aides to use for evaluate student writing. Before students present final work to the teacher, these systems assess language formation, structure, grammar, consistency, and structural set to give them with quick, basic suggestions along with clarity.

- **Modification of Conceptual Workflow**

The traditional grading cycle is totally reversed by AI. The facilitator receives a document that has already been studied, polished by an automated AI system rather than spending hours to fix mechanical spelling, punctuation, and simple sentence patterns. This enables the teacher to concentrate their criticism on intricate, deep writing components, including the new thoughts, ideology, concepts, held uniqueness, emotional resonance, voice, and rhetorical complexity. The teacher becomes a high-level creative mentor, guide instead of a robotic proofreader.

5. Educational Structures for Harmonious Integration

Facilitator need strong basic conceptual frameworks ideas that link technology with tried-and-true teaching strategies and approaches in order to properly balance and integrate AI in the class room without sacrificing the human aspect and also carry human touch.

5.1 The Framework for TPACK-AI

The TPACK-AI framework must replace the conventional Technological Pedagogical Content Knowledge (TPACK) framework. This subject necessitates that educators and learners, comprehend not only their subject concept matter and how students teach the subjects

(pedagogy), but also how AI systems (technology) impact student comprehension and content studies.

A facilitator or guide using the TPACK-AI paradigm is aware of the advantages and cognitive constraints of technologies that used by AI. They ensure that AI supports learning strategies rather than find them by knowing exactly when an automated tool of AI will help to explain the concept when it can lead to passive learning.

5.2 Adaptive and Differentiated Learning Frameworks

AI technology makes individual possible on a never-before-seen ideas and scale. A single classroom may adopt numbers of different learning routes and ideas at once thanks to adaptive AI software. This environment is managed by the smart teacher, who uses automated AI technologies to give new, advanced tasks to pupils who are ahead of pace and support to those who are struggling. This paradigm ensures that no student is left behind by shifting teaching learning process from a fixed-time, variable-outcome model (where everyone spends two weeks on a topic regardless of competence) to a variable-time, mastery-based model.

6. Conceptual Difficulties and the Preservation of Humanity

There are several theoretical obstacles, hurdles as well as opportunities for integrating AI into schooling. These fundamental concerns, ideas, thoughts must be carefully and critically studied and examined in order to move toward a smart future without complaining.

6.1 Automated Standardization's Danger

The possibility AI uniformity is one of the main issues with the broad usage of AI in education. Machine learning methods favor consistent, predictable responses since they rely on past patterns. AI evaluation in grading and instructional ideas, systems increases potential of molding students to write, think, pick, design and solve problems in new ways if they are granted excessive authority. By promoting non-linear thinking, unorthodox creativity, and artistic expression with realization that help them to predict, astute educators must actively fight this trend.

6.2 Dependency on Technology and Cognitive Atrophy

As we all knew Generative AI tools are so easy to use, they present serious risks to students' mental thoughts. Following or believing heavily on AI for writing, programming, and basic problem-solving can cause cognitive decline. As a result, students may lose their critical ability to study independently, build logical arguments, and structure their thoughts with own opinions. When technology takes over all the intellectual labor, human cognitive skills naturally weaken.

To prevent this and build mental resilience, beliefs, for that educators need to create learning environments that feature "desirable difficulties"—intentional mental obstacles that force students to use their own brains to succeed .This is the task openly every stages one can detect it and solve it.

6.3 Preserving the Educational Bond

A machine cannot compute or duplicate the relationship between a teacher and a student, which is characterized by respect, growth, inspiration, and emotional and dedicated support. Human relationships are the foundation of education. Given technology runs the risk of creating a sterile, isolated digital environment in the learning process. In order to maintain

interest, communication, cooperative group projects, at the core of the educational process, educator makes sure that AI is always a helpful tool and it's a new bond like trust.

7. Institutional Policy and Teacher Preparation Strategic Framework

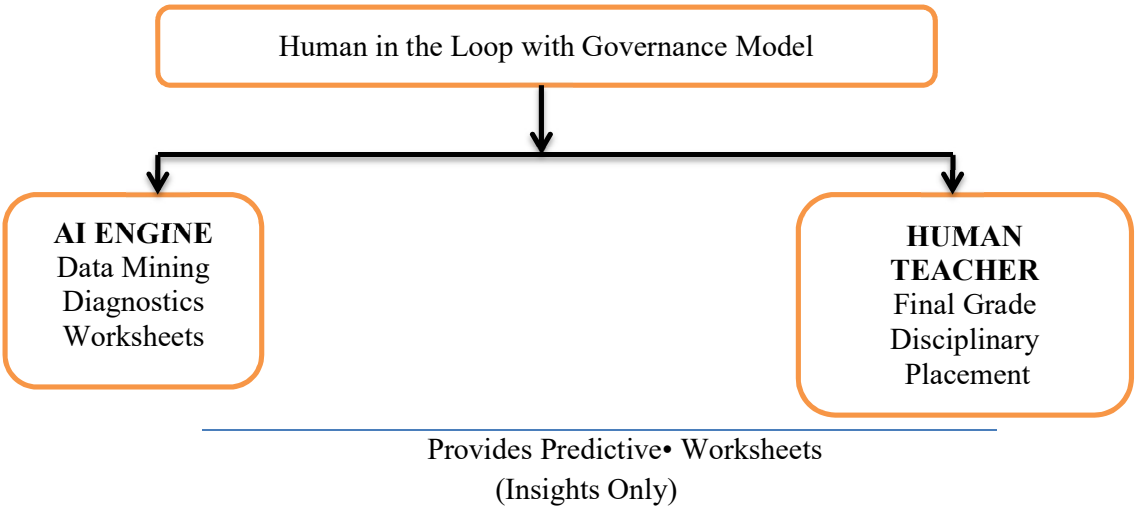
Systematic changes in professional teachers training, infrastructure, and legislation are necessary to create an AI-augmented educational ecosystem. This will help to build new thoughts and new era of structuring the new possibility which are in imagination.

7.1 Using an Interdisciplinary Perspective to Rethink Teacher Training

The current and basic pathways used by teacher training institutions (TTI's) need to be fundamentally reshaped. AI can no longer be treated as a stand-alone, elective seminar in professional and ethical development. Rather, core education programs should incorporate multidisciplinary studies that combine learning philosophies; data ethics, cognitive psychology, and evaluation are basic principles. This guarantees that new aspirants see AI as a professional, realistic, manageable tool.

7.2 Creating "Human-in-the-Loop" Governance Frameworks

This frameworks established by educational organizations. All high-stakes choices, including final courses, grades, disciplinary measures, evaluations and student placements, should ultimately be made by trained human facilitators, according to these laws, even though AI can help them with grading, diagnostics, administrative and assessment work and great impact in teaching learning strategies. Algorithms should never take the place of human expert judgments.



8. Conclusion

Now a Days AI is multidisciplinary incorporated in to education field which specifically signifies a fundamental, basic shift in the exchange of knowledge. Developing the "Smart Teacher" or facilitator is a crucial step towards making technology benefits to society as a whole. Smart teachers use AI from a mere automation tool into a catalyst for human potential by fusing technical aspects with psychology, sociology, and ethics. The need of education is to develop critical, sympathetic, and creative minds as we moving towards automated future. Understand AI needs to be focused and used for superior knowledge.

TECHNOLOGY INTEGRATION IN SCHOOL EDUCATION: A SURVEY OF TEACHERS' ATTITUDES, PRACTICES AND CHALLENGES IN PRIVATE SCHOOLS OF NAGAMANGALA TALUK

Mr. Shivanna C L
Assistant Professor BGS College of Education Adichunchanagiri University B G Nagar, Nagamangala Tq, E mail.id: shivanna.cl@acu.ac.in

Abstract

The rapid development of digital technologies has significantly influenced teaching and learning practices in school education. The effective integration of technology depends not only on the availability of digital resources but also on teachers' attitudes, classroom practices and the challenges they encounter. The present study examined teachers' attitudes towards technology integration, identified the major challenges faced by teachers, and determined the relationship between teachers' attitudes and their technology integration practices in private schools of Nagamangala Taluk, Mandya District, Karnataka. A descriptive survey method was adopted. The population consisted of approximately 200 teachers working in private schools affiliated with CBSE, ICSE and State curriculum. A sample of 120 teachers was selected using stratified random sampling. Data were collected through a structured questionnaire consisting of items related to teachers' attitudes, technology integration practices and challenges. Descriptive statistics, including frequency, percentage, mean and standard deviation, were used to analyse the data, while Pearson's product-moment correlation was used to examine the relationship between teachers' attitudes and technology integration practices. The illustrative findings indicate that the majority of teachers had a positive attitude towards technology integration, although several challenges related to infrastructure, internet connectivity, technical support, training and time constraints were reported. A positive relationship was also observed between teachers' attitudes and their technology integration practices. The study suggests that sustained professional development, adequate infrastructure and institutional support are essential for effective technology integration in school education.

Keywords: *Technology Integration, Teachers' Attitudes, Digital Technology, School Education, Technology Practices, Challenges, Survey Method*

1. Introduction

Technology has become an integral component of contemporary education. The increasing availability of smart classrooms, digital learning resources, educational applications, online platforms, multimedia resources and artificial intelligence-based tools has created new possibilities for teaching and learning. Technology can support teachers in presenting complex concepts, accessing diverse learning resources, engaging students, facilitating collaboration and assessing learning outcomes. The role of teachers remains central to the successful integration of technology. The availability of technological infrastructure alone cannot ensure meaningful technology-enhanced teaching. Teachers need appropriate digital competence, positive attitudes, pedagogical knowledge and institutional support to integrate technology effectively into classroom practices. Teachers' attitudes towards technology influence their willingness to adopt and use digital tools. Teachers who perceive technology as useful,

accessible and beneficial to student learning may be more willing to integrate it into their teaching. Conversely, lack of confidence, inadequate training, technical difficulties and negative perceptions may limit technology use. Private schools have increasingly adopted digital technologies to enhance teaching and learning. Schools affiliated with different curricula, including CBSE, ICSE and State curriculum, may differ in terms of infrastructure, availability of digital resources, teacher training and institutional expectations. Therefore, studying teachers' technology integration practices across different school contexts can provide useful insights. Nagamangala Taluk of Mandya District has a number of private educational institutions serving students from different backgrounds. Understanding teachers' experiences with technology in these schools is important for strengthening digital pedagogical practices. The present study therefore focuses on three major aspects: teachers' attitudes towards technology integration, the challenges faced by teachers, and the relationship between attitudes and technology integration practices.

2. Need and Significance of the Study

The integration of technology into school education is important for developing 21st-century learning environments. Digital technologies can facilitate interactive learning, multimedia-based instruction, collaborative activities, online assessment and access to educational resources. However, technology integration is not merely a matter of providing computers, projectors or internet facilities. Teachers need to possess the confidence and competence to select and use appropriate technologies according to learning objectives.

A survey of teachers can provide information regarding the current status of technology integration at the school level. It can also help identify barriers that may prevent teachers from using technology effectively.

The study is significant for the following reasons:

1. It provides information about teachers' attitudes towards educational technology.
2. It identifies major barriers affecting technology integration.
3. It examines whether positive attitudes are associated with greater technology use.
4. It may help school administrators plan appropriate professional development programmes.
5. It may assist policymakers in strengthening digital infrastructure.
6. It can provide useful information for teacher educators developing digital pedagogical competencies.

3. Statement of the Problem

“Technology Integration in School Education: A Survey of Teachers’ Attitudes, Practices and Challenges in Private Schools of Nagamangala Taluk.”

4. Objectives of the Study

The study was conducted with the following objectives:

1. To study teachers' attitudes towards the integration of technology in school education.
2. To identify the major challenges faced by teachers in integrating technology.
3. To determine the relationship between teachers' attitudes and their technology integration practices.

5. Research Questions

1. What is the level of teachers' attitudes towards technology integration in school education?
2. What are the major challenges faced by teachers while integrating technology into teaching?
3. Is there a significant relationship between teachers' attitudes and their technology integration practices?

6. Hypothesis

The following null hypothesis was formulated:

H_0: There is no significant relationship between teachers' attitudes towards technology integration and their technology integration practices.

7. Methodology

7.1 Research Method

The study adopted a **descriptive survey method**. The method was considered appropriate because the purpose was to collect information regarding teachers' existing attitudes, practices and perceived challenges related to technology integration.

7.2 Area of the Study

The study was conducted in **private schools located in Nagamangala Taluk, Mandya District, and Karnataka**.

7.3 Population

The population consisted of approximately **200 teachers** working in private schools in Nagamangala Taluk. The schools included institutions following **CBSE, ICSE and State curriculum**.

7.4 Sample and Sampling Technique

A sample of **120 teachers** was selected from the population using **stratified random sampling**.

The teachers were divided into three strata according to school curriculum.

Table 1 Distribution of Population and Sample

School Curriculum	Approximate Population	Sample	Percentage
CBSE	70	42	35.0
ICSE	50	30	25.0
State Curriculum	80	48	40.0
Total	**200**	**120**	**100.0**

The sample was selected proportionately to ensure representation of the three strata.

8. Research Tool

A structured questionnaire titled **"Teacher Technology Integration Questionnaire (TTIQ)"** was used for collecting data.

The questionnaire consisted of four sections.

Section A: Personal Information

This section collected information regarding:

- Gender
- Age

- Teaching experience
- Educational qualification
- School curriculum
- Subject taught
- ICT training

Section B: Teachers' Attitudes towards Technology

This section contained **15 items** measuring teachers' attitudes towards technology integration.

The items covered:

- Perceived usefulness
- Perceived ease of use
- Confidence
- Motivation
- Perceived benefits to students
- Willingness to adopt new technologies

A five-point Likert scale was used:

Strongly Agree – Agree – Undecided – Disagree – Strongly Disagree

Section C: Technology Integration Practices

This section consisted of **10 items** measuring teachers' classroom technology practices.

The items covered:

- Multimedia presentations
- Smart boards
- Digital learning resources
- Online educational platforms
- Educational applications
- Online assessment
- Video-based learning
- Digital collaboration
- Online assignments
- AI-supported educational tools

Section D: Challenges

This section consisted of **10 items** related to challenges in technology integration.

Major areas included:

- Poor internet connectivity
- Lack of digital devices
- Technical problems
- Lack of training
- Lack of technical support
- Time constraints
- Large class size
- Lack of suitable digital resources
- Limited digital competence
- Institutional constraints

9. Validity and Reliability

The questionnaire was subjected to expert review by specialists in teacher education and educational technology to establish content validity. Based on their suggestions, ambiguous and repetitive items were modified.

For the purpose of this draft, the illustrative pilot analysis yielded an overall **Cronbach's alpha reliability coefficient of 0.89**, indicating satisfactory internal consistency.

Note: The value 0.89 is an approximate/illustrative value and must be replaced with the actual reliability coefficient obtained from your pilot study.

10. Data Collection Procedure

The researcher contacted selected private schools in Nagamangala Taluk and obtained the necessary permission for data collection. The purpose of the study was explained to the participating teachers.

The questionnaire was administered to 120 selected teachers. Participants were informed that their responses would be used only for academic purposes. After completion, the questionnaires were collected, coded and prepared for statistical analysis.

11. Statistical Techniques

The following statistical techniques were used:

1. Frequency
2. Percentage
3. Mean
4. Standard deviation
5. Ranking
6. Pearson's product-moment correlation coefficient

12. Data Analysis and Interpretation

Objective 1

To study teachers' attitudes towards the integration of technology in school education.

Table 2 Level of Teachers' Attitudes towards Technology Integration

Level of Attitude	Frequency	Percentage
Low	12	10.0
Moderate	38	31.7
High	70	58.3
Total	**120**	**100.0**

Interpretation

The illustrative findings indicate that **70 teachers (58.3%)** demonstrated a high level of positive attitude towards technology integration. **38 teachers (31.7%)** showed a moderate level of attitude, whereas **12 teachers (10.0%)** demonstrated a low level.

The findings suggest that the majority of teachers had a favorable perception of technology integration in school education. This indicates that teachers generally recognize the usefulness of technology in improving classroom teaching and learning.

Table 3 Teachers' Attitudes towards Different Dimensions of Technology

Dimension	Mean	SD	Level
Perceived usefulness	4.18	0.64	High
Ease of use	3.82	0.72	High
Confidence	3.74	0.79	Moderate
Student learning benefits	4.21	0.61	High
Willingness to adopt technology	4.05	0.67	High
Overall	**4.00**	**0.69**	**High**

Interpretation

Among the different dimensions, teachers reported the highest mean score for **perceived benefits of technology for student learning (M = 4.21)**. Perceived usefulness also obtained a high mean score of **4.18**.

Teachers' confidence in using technology had a comparatively lower mean score of **3.74**, suggesting that although teachers generally recognise the importance of technology, some may require additional training and support to use digital tools confidently.

13. Objective 2

To identify the major challenges faced by teachers in integrating technology.

Table 4 Major Challenges Faced by Teachers

Sl. No.	Challenge	Mean Score	Rank
1	Poor/unstable internet connectivity	4.12	I
2	Lack of adequate digital devices	3.96	II
3	Lack of technical support	3.87	III
4	Insufficient training opportunities	3.79	IV
5	Time required for technology-based preparation	3.72	V
6	Technical problems during classroom teaching	3.68	VI
7	Limited digital competence	3.54	VII
8	Difficulty in finding appropriate digital resources	3.42	VIII
9	Large class size	3.31	IX
10	Lack of institutional encouragement	3.18	X

Interpretation

The findings indicate that **poor or unstable internet connectivity** was the most significant challenge reported by teachers, with a mean score of **4.12**. This was followed by **lack of adequate digital devices (M = 3.96)** and **lack of technical support (M = 3.87)**.

Insufficient training opportunities also emerged as an important challenge. These findings suggest that teachers' willingness to use technology may not always translate into effective classroom practice because infrastructural and professional barriers continue to influence technology integration.

14. Objective 3

To determine the relationship between teachers' attitudes and their technology integration practices.

Table 5 Correlation between Teachers' Attitudes and Technology Integration Practices

Variables	N	r-value	p-value	Decision
Attitudes and Technology Integration Practices	120	0.58	<0.001	Significant

Interpretation

The illustrative analysis indicates a **positive and statistically significant relationship** between teachers' attitudes towards technology and their technology integration practices (**r = 0.58, p < 0.001**).

Therefore, the null hypothesis stating that there is no significant relationship between teachers' attitudes and technology integration practices is **rejected**.

The result suggests that teachers with more positive attitudes towards technology tend to report higher levels of technology integration in their classroom practices.

Note: The correlation value is illustrative and must be recalculated using your actual questionnaire data before publication.

15. Findings

Based on the illustrative analysis, the following findings were obtained:

1. A majority of teachers (**58.3%**) demonstrated a high level of positive attitude towards technology integration.
2. Approximately **31.7%** of teachers demonstrated a moderate level of attitude.
3. Teachers perceived technology as useful for improving student learning and classroom instruction.
4. Teachers' confidence in using technology was comparatively lower than their perceived usefulness of technology.
5. Poor internet connectivity emerged as the most significant challenge.
6. Lack of digital devices and technical support were other major challenges.
7. Lack of training was identified as an important professional barrier.
8. A positive and significant relationship was found between teachers' attitudes and their technology integration practices.
9. The findings indicate that positive attitudes may be associated with greater use of technology in classroom teaching.

16. Discussion

The findings suggest that teachers generally have favourable attitudes towards technology integration. The high level of perceived usefulness indicates that teachers recognise the potential of digital technologies to improve classroom teaching and student learning.

However, the findings also indicate a gap between positive attitudes and actual implementation. Teachers may be willing to use technology but face difficulties arising from inadequate infrastructure, internet connectivity and technical support.

The relatively lower score for teachers' confidence indicates the importance of continuous professional development. Training programmes should move beyond basic computer literacy and focus on **digital pedagogical competence**, including the selection of appropriate digital

resources, technology-supported assessment, collaborative learning and responsible use of emerging technologies.

The significant positive relationship between attitudes and technology integration practices indicates that teachers' perceptions may play an important role in technology adoption. Creating positive experiences through training, peer support and successful classroom implementation may therefore encourage teachers to use technology more frequently and effectively.

17. Educational Implications

The findings have several implications for school education.

17.1 Professional Development

Schools should organise regular workshops on digital pedagogy, educational applications, digital assessment and emerging technologies.

17.2 Infrastructure

Adequate computers, projectors, smart boards, digital devices and reliable internet connectivity should be provided.

17.3 Technical Support

Schools should provide timely technical assistance so that teachers do not discontinue technology-based teaching because of technical problems.

17.4 Teacher Confidence

Professional development should provide teachers with opportunities for hands-on practice and classroom experimentation.

17.5 Sharing of Best Practices

Teachers who effectively integrate technology should be encouraged to share their experiences and teaching strategies with colleagues.

17.6 Institutional Support

School management should create an environment that encourages teachers to experiment with appropriate technologies without excessive fear of technical failure.

18. Limitations

The study has the following limitations:

1. The study was limited to private schools in Nagamangala Taluk.
2. The sample consisted of approximately 120 teachers.
3. The study included CBSE, ICSE and State curriculum schools.
4. Data were collected through self-reported responses.
5. The study used a descriptive survey design and therefore does not establish a causal relationship.
6. The findings may not be generalized to all schools in Karnataka.

19. Suggestions for Further Research

Further studies may be undertaken to:

1. Compare technology integration among government and private school teachers.
2. Compare CBSE, ICSE and State curriculum schools.
3. Study teachers' digital pedagogical competence.
4. Examine students' perceptions of technology-supported learning.

5. Investigate the effectiveness of AI tools in school education.
6. Conduct an experimental study to determine the effectiveness of technology-based teaching.
7. Conduct qualitative interviews to understand teachers' experiences in greater depth.
8. Study the relationship between teachers' digital competence and student achievement.

20. Conclusion

Technology integration has become an important component of contemporary school education. The present survey study indicates that teachers generally possess positive attitudes towards the use of technology in teaching and learning. At the same time, several challenges, particularly inadequate internet connectivity, insufficient digital resources, limited technical support and training opportunities, may restrict effective implementation.

The positive relationship between teachers' attitudes and their technology integration practices highlights the importance of developing favourable perceptions and confidence among teachers. However, positive attitudes need to be supported by appropriate infrastructure, professional development and institutional assistance.

Therefore, effective technology integration should be viewed as a combination of **teacher readiness, digital pedagogical competence, infrastructure, technical support and institutional commitment**. Strengthening these areas can help private schools in Nagamangala Taluk create more effective, engaging and technology-supported learning environments?

AN EMPIRICAL INVESTIGATION OF ARTIFICIAL INTELLIGENCE LITERACY AMONG PROSPECTIVE EDUCATORS: PERSPECTIVES FROM B.ED. TEACHER TRAINEES IN SOUTHERN KARNATAKA

Dr. Sowmya N S
Assistant Professor, BGS College of education, Adichunchanagiri University,
B G Nagara, Nagamangala, Mandya district-571448, naidusowmya1990@gmail.com

Abstract

Artificial Intelligence (AI) is quickly changing education by impacting research, teaching, learning, assessment, content creation, and educational administration. AI literacy has emerged as a critical skill for student teachers. The study evaluates the level of Artificial Intelligence Literacy among BEd teacher trainees. The current study looked at 344 B.Ed. teacher trainees from particular Karnataka teacher education institutions' levels of artificial intelligence literacy. AI Knowledge and Understanding (AIKU), AI Use and Apply (AIUA), AI Self-Efficacy (AISE), and AI Ethics (AIE) are the four main aspects of AI literacy that were the subject of the study. The collected data were analysed using descriptive and inferential statistics, including Mean, Standard Deviation, independent-samples t-test, and linear regression. The findings indicated that there was no significant difference in AI literacy between male and female B.Ed. students. Male students obtained a mean score of 130.81 (SD = 13.30), whereas female students obtained a mean score of 132.00 (SD = 15.30), with a t-value of 0.50, indicating a non-significant difference. Similarly, comparison between first-year and second-year B.Ed. students revealed no significant differences in AI Knowledge and Understanding, AI Use and Apply, and the combined dimensions of AI Self-Efficacy and AI Ethics. The results indicate that gender and academic year did not significantly influence the measured dimensions of AI literacy in the present study. The study recommends continuous professional development, practical AI training, curriculum integration, adequate digital infrastructure, and responsible-use guidelines to prepare B.Ed. students for AI-enabled educational environments

Keywords: *Artificial Intelligence Literacy, B.Ed. teacher trainees, Digital Pedagogy, TPACK.*

INTRODUCTION:

Artificial Intelligence has emerged as one of the most influential technologies of the digital era and is increasingly becoming part of educational practices. AI applications are being used for lesson planning, development of teaching-learning materials, assessment, personalised learning, feedback, research, language learning, and educational administration. AI is becoming a crucial component of digital-age education and is no longer futuristic (Alwyn Vwen Yen LEE, 2020).India's revolution in artificial intelligence literacy potential to transform education administration, instruction, and learning. Data-driven decision-making, enhanced access, and specially tailored education (Viji & Agarwal, 2024)AI in education aims to use computer intelligence to improve teaching and learning above traditional classroom instruction, not to replace human teachers with robotic ones (Mita Banerjee, Pandey, 2024). AI is boosting student engagement, increasing instructional effectiveness, and facilitating individualised learning. AI is also redefining administrative duties and evaluation techniques. (Krishna Kumari Chetry, 2024)

Teachers appreciated how Chat-GPT and other AI technologies could speed up lesson planning and enhance personalization. Despite their optimism, the poll found that many teachers needed more targeted support and training. Successful integration requires that AI technologies be in line with existing curricula and cultural norms (Filiz, Kaya, & Adiguze, 2025). AI is well-prepared or supported and can influence AI progress in the future (Gayed, 2025). Institutions and educators should be prepared to handle AI tools sensibly. Additionally, it is critical to prepare students for situations dominated by AI (Ayala-Pazmiño, 2023) The study encourages international discussion on the safe, efficient, and equitable application of AI. Finally, it promotes ongoing innovation using inclusive methods (Borhene Chakroun et al., UNESCO, 2019). teaching in the twenty-first century requires updated digital literacy. Teachers need to be prepared to use and instruct AI. (Davy Tsz Kit and others, 2023)ethical standards in regulating AI's role in education and stresses a fundamental understanding of AI as crucial for future digital citizens (Matthias Carl Laupichler, et al. 2022) AI might someday take over education, leaving educators to handle punishment (S. K. Khatik and Praful Patel, 2021). AI's human-like abilities, like speech and picture recognition, are emphasised. The study makes recommendations for enhancing AI for better learning (V.V. Subrahmanyam and K. Swathi 2018)

Pre-service teachers' usage of the Magic School AI tool for assessment; the findings show a global increase in interest but a lack of focus on professional teaching skills in AI contexts (Katarina Sperling et al., 2024).AI was found to improve time efficiency and facilitate the creation of questions and rubrics. (Erdem Gamze Coşgun, 2025) AI tools shouldn't be abused for academic dishonesty and that they can improve learning, but they must be utilised carefully and under ethical supervision (Souvik Paul, Dr. Biswajit Chatterjee, 2025).it foresees a time when innovative, non-digital assessments can take the place of conventional evaluation techniques (Chokri Kooli, 2024). AI can improve educational inclusion with the appropriate practices and regulations (Julien, 2024).study advise decision-makers to strike a balance between human-centered education and technical innovation (Al-Zahrani 2024).AI should support conventional teaching techniques rather than take their place (Goyal et al., 2025).There is still little proof, the results indicate that AI tools can improve learner engagement and lower anxiety (AlTwjiri & Alghizzi, 2025). AI technologies affect effective learning elements in English as a Foreign Language (EFL) classroom such as motivation, attitude, and anxiety. (Dennison et al., 2025) Teachers may make data-driven judgements and provide more individualised instruction thanks to AI. (Dipanwita Bit and others, 2024)According to interviews, 77% of students thought the technology was helpful for rules and engagement. (Rad Shafiee, 2025)

Human-AI Synergy Degree Model (HAI-SDM). "Synergy degree" ranged from low to moderate, indicating discrepancies in the way the human and AI systems collaborated across several subsystems, such as subject, process, or environment (Kong, Fang, et al., 2025)AI can adjust feedback, pace, and content to needy, increasing interest and results. Adaptive learning paths, automatic feedback, and simplified administrative procedures are among the advantages (Merino-Campos, 2025).governmental support and cooperation from public-private partnerships is required for In order to use AI in classroom settings, the study calls (Kumar,

A., & Singh, P. (2020).

AI offers customized learning routes and emphasis perceived advantages like productivity and student engagement. (Lazar Krstić et.al., 2022), research demonstrates that training teachers for a tech-centered future requires improving digital literacy (Lademann et al., 2024). foundational AI training, collaborative learning, and ongoing professional development emphasise mindset adjustments towards AI-assisted education and learner empowerment. (Akilu Ismail et al. (2024),Chat-GPT discovered advantages in efficiency, access, and personalised learning. Chat-GPT enabled innovative education (Fatih Karataş et al., 2024). AI the value of transparency, fairness, and the capacity for explanation in AI-based learning. According to Swagatika Devi emphasiseset al. (2023)AI literacy did not predict emotion control, but it did have a favourable impact on comprehension, ethics, and problem-solving (Bo Pei et al.,2024) It suggests creating AI literacy courses that emphasise understanding, development, and moral application (Musa Adekunle Ayanwale et al., In 2024. Digital Education Council's suggestion strategy for AI Literacy Framework. AI has been demonstrated to personalise learning and simplify administration. (Taylar Wenzel and Michelle Kelley, 2025 Artificial Intelligence is viewed as a tool not substitute for educators (Lucas Kohnke et al., 2025)

Teacher education should include ethics-based AI training. Although they encouraged responsible use, students had a good opinion of AI (Souvik Paul et al., 2025). Teachers and curriculum designers are advised by TPACK to develop frameworks for digital competency that ensure both national and international standards. In addition to diverse domains that support fundamental skills and evolutionary research, it promotes teacher education. TPACK offers extra benefits during teacher training since it may address lesson design, efficiently integrate technology, increase student engagement, and create opportunities for personalized learning through enhanced learning outcomes. First, it provides educators with a strong scientific foundation for collaborative learning and interdisciplinary mentoring. Inadequate technology infrastructure, a lack of training in digital pedagogy, and technological barriers to successful implementation of some of the restrictions noted are all present in educational institutions.

OBJECTIVES OF THE STUDY

Objective -1 To compare the levels of AI literacy among male and female B.Ed. teacher trainees.

Objectives-2: To find whether there is a significant difference in AIKU (AI Knowledge & Understanding), AIUA (AI Use & Apply), AISE (AI Self-Efficacy) and AIE (AI Ethics) among I year and II year B.Ed. teacher trainees.

HYPOTHESIS OF THE STUDY

Hypothesis -1: There is no significant difference in the levels of AI literacy between male and female B.Ed. teacher trainees.

Hypothesis -2: There is no significant difference in AIKU (AI Knowledge & Understanding), AIUA (AI Use & Apply), AISE (AI Self-Efficacy) and AIE (AI Ethics) among I year and II year B.Ed. teacher trainees.

METHODOLOGY FOR THE STUDY

Respondents Profile: The study consisted of 344 B.Ed. students enrolled in teacher education institutions located in five districts of Karnataka, namely Hassan, Shivamogga, Mysuru, Bengaluru, and Mandya. The inclusion of students from different districts was intended to provide representation from different teacher education contexts. The respondents included B.Ed. students from different academic years and demographic groups.

Sampling Technique: A simple random sampling technique was adopted for the selection of B.Ed. students. The sampling procedure considered relevant demographic and academic characteristics to obtain representation from the selected teacher education institutions.

Research Design: The study adopted a descriptive survey research design to examine the level of Artificial Intelligence literacy among B.Ed. students and to compare AI literacy across selected demographic and academic variables.

Instrument: Artificial Intelligence Literacy Assessment Scale (AILAS) - A self-constructed tool was developed by the researcher, drawing the inferences from review of related literature on AI literacy and digital pedagogy. The questionnaire consisted 21 items across three dimensions namely AIKU (AI knowledge & understanding), AIUA (AI use & apply) and AISE (AI self-efficacy) and AIE (AI ethics). The item was measured on a 5-point Likert scale. The instrument was assessing samples understanding, practical application, learning, ethical awareness, and problem-solving skills related to AI. Survey questions about responsive usage of AI in assignment writing were found in the second section of the questionnaire, whereas questions about the independent variable AI literacy were found in the final section.

Data Collection: Google form was used to gather data from English pedagogy B.Ed teacher trainees. Prior consent was acquired by the participants and participation was entirely voluntary. Throughout the process, the respondents' confidentiality and anonymity were preserved.

Data Analysis: SPSS was used to measure the data. Descriptive and inferential statistics were used in the study. To summarize the responses, Mean and Standard Deviation (SD) were used. The differences in AI literacy between background variables gender and locality was examined using independent t-test. Linear regression was used to predict the influence of components within AI literacy. The analytical approach of the study specified a comprehensive understanding of the AI literacy levels among B.Ed. teacher trainees across different demographic categories.

RESULTS AND DISCUSSION

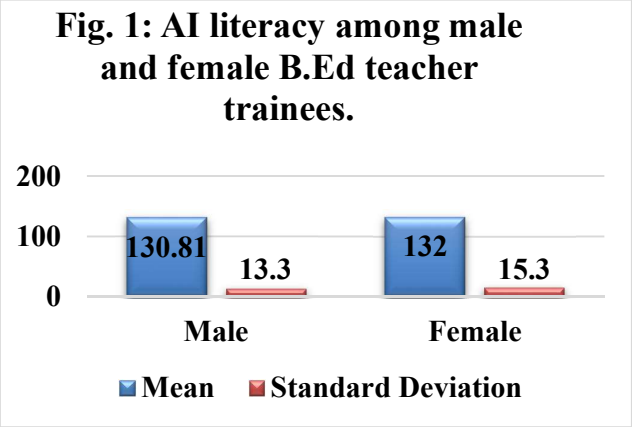
Objective -1 to compare the levels of AI literacy among male and female B.Ed. teacher trainees.

Hypothesis -1: There is no significant difference in the levels of AI literacy between male and female B.Ed. teacher trainees.

Table No.01: AI literacy among male and female B.Ed teacher trainees.

Gender	Mean	Standard Deviation	t-value	Significance
Male	130.81	13.30	0.50	NS
Female	132.00	15.30		

NS = Not Significant; $p > 0.05$.



The results indicate that the mean AI literacy score of male B.Ed. students was 130.81 (SD = 13.30), while the mean score of female B.Ed. students was 132.00 (SD = 15.30). The obtained *t*-value of 0.50 indicates that the difference between the two groups was not statistically significant at the 0.05 level. Therefore, the null hypothesis was accepted. The finding suggests that male and female B.Ed. students demonstrate broadly similar levels of AI literacy. Thus, gender does not appear to be a significant factor influencing AI literacy among the respondents in the present study.

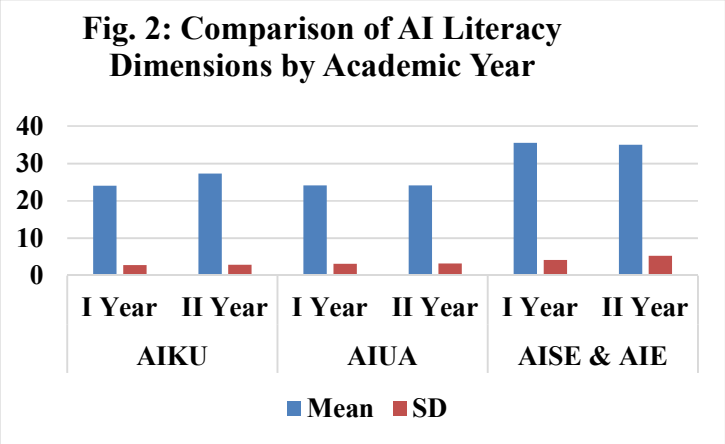
Objective 2:To find whether there is a significant difference in AI Knowledge and Understanding (AIKU), AI Use and Apply (AIUA), AI Self-Efficacy (AISE), and AI Ethics (AIE) among first-year and second-year B.Ed. students.

Hypothesis 2: There is no significant difference in AI Knowledge and Understanding (AIKU), AI Use and Apply (AIUA), AI Self-Efficacy (AISE), and AI Ethics (AIE) among first-year and second-year B.Ed. students.

Table 2: Comparison of AI Literacy Dimensions by Academic Year

Dimension	Year	Mean	SD	t-value	p-value	Result
AIKU	I Year	24.03	2.82	0.67	0.50	NS
	II Year	27.27	2.85			
AIUA	I Year	24.05	3.13	0.01	0.98	NS
	II Year	24.04	3.24			
AISE & AIE	I Year	35.54	4.14	0.85	0.39	NS
	II Year	35.04	5.19			

Note: NS = Not Significant; $p > 0.05$.



The results indicate that second-year B.Ed. students obtained a higher mean score in AI Knowledge and Understanding (27.27) compared with first-year students (24.03). However, the difference was not statistically significant ($t = 0.67$, $p = 0.50$). For AI Use and Apply, the mean scores of first-year and second-year students were almost identical, at 24.05 and 24.04 respectively. The obtained t-value of 0.01 and p-value of 0.98 indicate that there was no significant difference. For AI Self-Efficacy and AI Ethics, first-year students obtained a mean score of 35.54, while second-year students obtained 35.04. The difference was not statistically significant ($t = 0.85$, $p = 0.39$).

Therefore, the null hypothesis is accepted. The findings indicate that first-year and second-year B.Ed. students do not differ significantly in AI Knowledge and Understanding, AI Use and Apply, AI Self-Efficacy, and AI Ethics.

CONCLUSION

The study examined AI literacy through four major dimensions: AI Knowledge and Understanding, AI Use and Apply, AI Self-Efficacy, and AI Ethics. The findings indicate that there is no significant difference in AI literacy between male and female B.Ed. students. The mean scores of male and female students were relatively similar, and the obtained t-value was not statistically significant. Therefore, gender was not found to be a significant factor influencing AI literacy among the respondents. Similarly, the comparison between first-year and second-year B.Ed. teacher trainees revealed no significant difference in AI Knowledge and Understanding, AI Use and Apply, AI Self-Efficacy, and AI Ethics. Although second-year students demonstrated a higher mean in AI Knowledge and Understanding, the difference did not reach statistical significance. AI Use and Apply scores were almost identical between the two groups, while the difference in AI Self-Efficacy and AI Ethics was also statistically non-significant. The findings therefore suggest that AI literacy does not necessarily develop automatically through gender, academic year, or progression within the B.Ed. programme. Instead, meaningful development of AI literacy requires planned educational interventions, practical exposure, curriculum integration, institutional support, and continuous professional development.

ANALYTICAL STUDY OF AI LITERACY AND TEACHER READINESS AMONG PRE-SERVICE EDUCATORS IN KARNATAKA

Mr. Devaraju B N
Assistant Professor, BGS College of education, Adichunchanagiri University, B G Nagara, Nagamangala, Mandya district-571448 devarajubnhsn@gmail.com

Abstract

The rapid growth of AI-literacy and being capable of integrating intelligent technologies into teaching-learning processes in a meaningful and ethical manner are desperately needed due to the integration of Artificial Intelligence in education. The present study examines the level of AI literacy among pre-service teachers enrolled in B.Ed. programmes in Karnataka and analyses differences based on selected demographic variables. A descriptive survey research method was adopted for the study. The sample consisted of 321 B.Ed. students selected from teacher education institutions representing different districts of Karnataka through a simple random sampling technique. Descriptive statistics such as mean and standard deviation and inferential statistics such as the independent samples t-test were employed for data analysis. The findings indicate that pre-service teachers possess a developing level of AI literacy and that AI has considerable potential to support lesson planning, assessment, personalized learning, instructional design, and educational decision-making. The study emphasizes the need for systematic AI literacy programmes, practical training, ethical awareness, and integration of AI-related competencies into teacher education curricula. Strengthening AI literacy among B.Ed. students can contribute to developing professionally competent, technologically confident, and ethically responsible teachers capable of responding effectively to the emerging demands of AI-enabled education.

Keywords: *Artificial Intelligence, AI Literacy, Pre-Service Teachers, B.Ed. Students, Teacher Readiness, AI Self-Efficacy, AI Ethics, Teacher Education*

INTRODUCTION:

Artificial intelligence in education is a About leveraging computer intelligence to make the teaching and learning more effective and better than traditional classroom learning, not about replacing human teachers with robotic ones. By serving as a mediator, peer supported collaborative learning (PSCL) (Mita Banerjee,2024) This study explosive AI literacy in teacher education through a professional partnership model. Using the Digital Education Council's AI literacy framework, they restructured their teaching approach to include AI-driven methods (Michelle Kelley and Taylar Wenzel, 2025) The study investigates pre-service teachers' use of the magic school AI tools for assessment . It found AI increased time efficiency and supported question generation rubrics (Gamze Erdem, 2025)

AI systems automatically evaluate and assist in addressing the various demands and difficulties of the learners (Lazar Krstic, et.al.,2022)AI is present in many aspect of our daily lives, including Google, Siri smartphones and smart home gadgets. (BurgSteiner et.al.,2016). AI in education has increased. Establishing AI competency requirements in the Humanity and

STEM field promotes Interdisciplinary learning and prepares students for careers driven by AI (Barrerra Castro et.al.,2024).

AI awareness campaign and curricular integration are examples of practical strategies. To prepare future teachers foundation literacy must be strengthened.(Shi Ruisi,2024) The Technological Pedagogical and Content Knowledge (TPACK). TPACK framework was introduced by Mishra and Koehler in 2006. TPACK is a comprehensive model that expresses the ways and means of integration of technology with pedagogy and subject content in the present educational environment. Technology like automated grading, intelligent tutoring and natural language processing. The teacher may use AI to make the data driven judgment and provide more individual instruction (Dipanwita Bit and et.al.,2024)

TPACK offers more benefits during teacher training because it improves lesson designing, effective integration of technology, increases student involvement, opportunities for personalized learning through enhanced learning outcomes. TPACK offers a suggestion to educationalist, curriculum designers to frame the curriculum that ensures national (NEP 2020) and global (UNESCO) frameworks on digital competency In AI based education, justice, transparency and capacity for explanation or emphasis. AI just serves as a support system and won't take the place of teachers (Swagatika Devi, et.al.,2023) Practical experience was connected with ethical awareness and confidence in employing AI tools. Collaborative learning and hands-on training are advised (Bo Pei,2024) AI literacy did not predict emotion control, but it did have a favourable impact on comprehension, ethics and problems solving. It suggests creating a literacy program that emphasizes understanding, development and moral application (Musa, et.al.,2024)AI literacy is conceptualized in a teacher education literature. The results reveal a global rise in interest but limited focus on professional teaching knowledge in AI context (Katarina,et.al.,2024)

AI's human-like abilities, like speech and picture recognition are emphasized. The study provide recommendation for enhancing AI for better learning (V V Subrahmanyam and K Swathi 2018) the study promotes the use of new assessment instruction and the incorporation of literacy into educational policies (Hasan and etl.al.,2024) AI has a capacity to completely transform education, learning and teaching data driven decision making, enhanced access and specially toiler education (Viji Agarwal., 2024) increases students' engagement with AI tools and their views of academic quality. It recommended incorporating PSCL and AI tools into curriculum in order to maximize the learning setting (Genimon,et.al.,2024) The paper calls for worldwide conservation above the failure and secure application of AI. It promotes on going innovation and inclusive approaches (Borhene Chakroun2019)

AI became a core component of digital age teaching and is no longer considered futuristic (Alwyn Vwen et.al.,2020) AI is being used not just in corporate sector but also in education, administration and campus management (Shivangi Dhawan, Gopal Batra 2021) AI should be used as a support system to manage its integration, appropriate policy frame and awareness campaign required. (Harry and Sayudin,2023) To exam and improve the cooperation the research created the human AI Synergy degree model (HAI-SDM) (Kong,Fang, et.al.,2025)

AI should be used as a support system to manage its integration, appropriate policy

frame and awareness campaign required. (Harry and Sayudin,2023) To exam and improve the 6degree model (HAI-SDM) (Kong,Fang, et.al.,2025) AI is described as a two-edged sword that needs to be strategically integrated(Ajani,Ankintolu,2024) AI promotes an adaptable learning environment and allows for personalized training. Performance, satisfaction and learning outcomes have all improved with the use of AI(Ajani and Maphalala,2025)AI increases significance, research on its effects on education still need to be done (Francisco 2019) To exam and improve the cooperation the research created the human AI Synergy degree model (HAI-SDM) (Kong,Fang, et.al.,2025)

AI became a core component of digital age teaching and is no longer considered futuristic (Alwyn Vwen et.al.,2020) AI AI should be used as a support system to manage its integration, appropriate policy frame and awareness campaign required. (Harry and Sayudin,2023 The strategy was informed by the AI literacy framework of the digital education council. Being demonstrator to personalized learning and expedite administration (Taylar Wenzel,2025) Students may use AII technology efficiently and critically awareness lessens overconfidence(Senad Becirovic et.al 2025) Lack of adequate training for the educators to use AI effectively is a significant problem. It emphasizes how difficult it is to implement AI. (Azzam and Charles,2024)

OBJECTIVES OF THE STUDY

Objective 1: To compare the level of AI literacy among male and female B.Ed. students.

Objective 2: To compare the level of AI literacy among B.Ed. students belonging to urban and rural localities.

HYPOTHESIS OF THE STUDY

H_o1: There is no significant difference in the level of AI literacy among male and female B.Ed. students.

H_o2: There is no significant difference in the level of AI literacy among B.Ed. students belonging to urban and rural localities.

RESULTS AND DISCUSSION

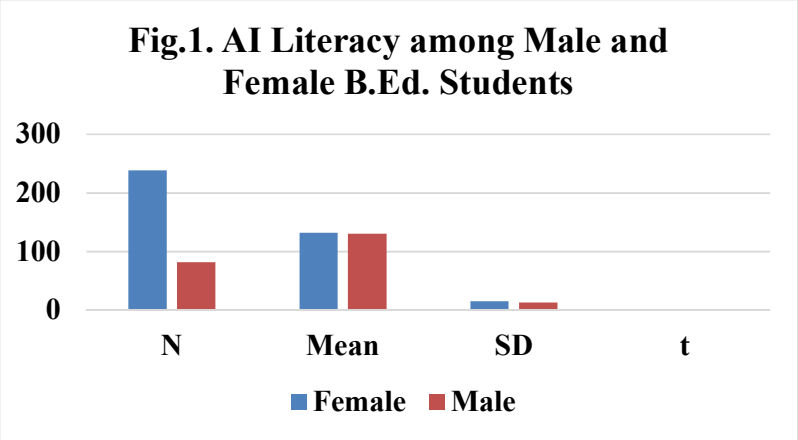
Objective 1: To compare the level of AI literacy among male and female B.Ed. students.

Hypothesis 1: There is no significant difference in the level of AI literacy among male and female B.Ed. students.

Table 1. AI Literacy among Male and Female B.Ed. Students

Gender	N	Mean	SD	*t*	Significance
Female	239	132.00	15.30	0.50	Not Significant
Male	82	130.81	13.30		

Note: NS = Not Significant; $p > 0.05$.



The results presented in Table 2 indicate that female B.Ed. students obtained a mean AI literacy score of **132.00** with a standard deviation of **15.30**, whereas male B.Ed. students obtained a mean score of **130.81** with a standard deviation of **13.30**. The calculated *t*-value of **0.50** is not statistically significant at the 0.05 level. Therefore, the null hypothesis is accepted. The findings indicate that there is **no significant difference in AI literacy between male and female B.Ed. students**.

Although female students obtained a slightly higher mean score than male students, the difference is statistically insignificant. This suggests that gender does not appear to be a major factor influencing overall AI literacy within the present sample.

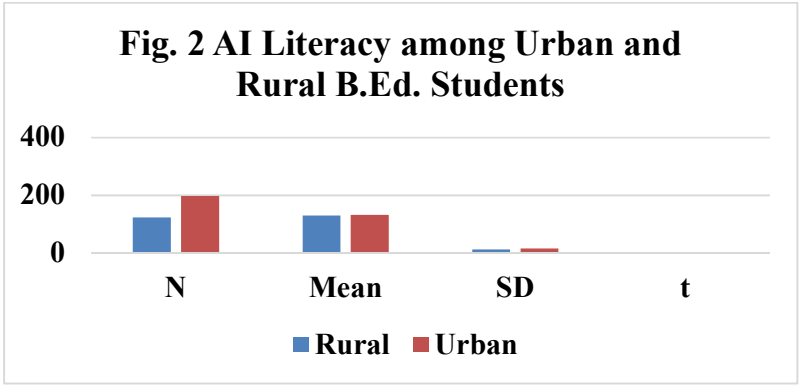
Objective 2: To compare the level of AI literacy among B.Ed. students belonging to urban and rural localities.

Hypothesis 2: There is no significant difference in the level of AI literacy among B.Ed. students belonging to urban and rural localities.

Table 2. AI Literacy among Urban and Rural B.Ed. Students

Locality	N	Mean	SD	*t*	Significance
Rural	123	130.69	13.29	0.81	Not Significant
Urban	198	132.34	15.60		

Note: NS = Not Significant; $p > 0.05$.



The results presented in Table 3 indicate that urban B.Ed. students obtained a mean AI literacy score of **132.34** with a standard deviation of **15.60**, while rural B.Ed. students obtained a mean score of **130.69** with a standard deviation of **13.29**.

The calculated *t*-value of **0.81** is not statistically significant at the 0.05 level. Therefore, the null hypothesis is **accepted**. The findings indicate that there is no significant difference in AI literacy between urban and rural B.Ed. students. Although urban students recorded a slightly higher mean score than rural students, the difference is not statistically significant. This suggests that locality does not have a substantial influence on AI literacy among the respondents included in the study.

LIMITATIONS OF THE STUDY

1. The study was limited to B.Ed. students in selected teacher education institutions in Karnataka.
2. The sample consisted of 321 respondents; therefore, the findings may not be generalized to all pre-service teachers without further investigation.
3. The study relied primarily on self-reported responses.

CONCLUSION

Artificial Intelligence is rapidly becoming an important component of contemporary education, creating both opportunities and challenges for teachers and teacher educators. The present study examined AI literacy among 321 B.Ed. students in Karnataka using four major dimensions: AI knowledge and understanding, AI use and application, AI self-efficacy, and AI ethics. The findings indicate that there is no statistically significant difference in AI literacy based on gender or locality among the respondents. This suggests that AI literacy development is not necessarily determined by demographic characteristics and that systematic educational opportunities can support the development of AI competencies among diverse groups of pre-service teachers. The study emphasizes that future teachers require more than technical familiarity with AI tools. They need conceptual understanding, practical competence, confidence, critical thinking, and ethical awareness. Therefore, teacher education institutions should move towards a structured model of AI competency development that combines theoretical knowledge, hands-on experience, pedagogical integration, critical evaluation, and ethical responsibility.

ARTIFICIAL INTELLIGENCE FOR PROFESSIONAL DEVELOPMENT OF CHEMISTRY TEACHERS: OPPORTUNITIES, CHALLENGES AND FUTURE DIRECTIONS

Dr.Prakash H S
Associate Professor, Hasanamba College of Education, Hassan, Karnataka, India.
Email Id- prakashhshce@gamil.com

Abstract

Artificial Intelligence (AI) is drastically transforming education by offering new opportunities for indivisalised learning, content creation, intelligent assessment, data analysis, and professional development. Chemistry teachers, in specifically, can take benefits from AI-supported professional development since chemistry education demands the integration of theoretical understanding, mathematical reasoning,laboratory skills, problem-solving, visualization and powerful pedagogical strategies. These thematic articles explore the potential of Artificial Intelligence(AI) for the professional development of chemistry teachers and examine how Artificial Intelligence(AI) can assist continuous learning, lesson planning, reflective practice,assessment, classroom innovation and collaborative learning. Artificial Intelligence(AI)tools can help teachers in developing teaching resources, identifying misconceptions, generating differentiated learning activities, simulating laboratory experiences, creating formative assessments and exploring complex chemical concepts through visual and interactive representations. Simultaneously, the use of Artificial Intelligence(AI) raises important concerns related to academic integrity, accuracy, teacher autonomy, bias, data privacy, digital inequality, and the possibility of excessive dependence on automated systems. The article contends that Artificial Intelligence(AI)should not substitute the professional knowledge and judgment of chemistry teachers but should function as anassistive partner in their continuing professional development (CPD). Effective Artificial Intelligence(AI)integration requires suitable digital competencies, ethical guidelines, institutional support, subject-specific training and opportunities for teachers to essentially evaluate Artificial Intelligence(AI)-generated content. A framework for Artificial Intelligence(AI)-supported professional development is intended based on five interconnected dimensions: Artificial Intelligence(AI) literacy, pedagogical integration, reflective practice, chemistry-specific application and ethical responsibility. The article concludes that accountable and intentional integration of Artificial Intelligence(AI) can reinforce chemistry teachers' professional learning and eventually contribute to more inclusive, engaging and effective chemistry education.

Keywords: *Artificial Intelligence, Professional Development, Chemistry Teachers, Artificial Intelligence(AI)Literacy, Teacher Education, Chemistry Education, Digital Technology, Generative Artificial Intelligence(AI).*

1. Introduction

Professional development is avital component of effective teaching. Teachers need continuous prospect to update their pedagogical practices, subject knowledge, technological competencies, assessment strategies and understanding of learners. In science education, professional development is eventually important because technologies,scientific knowledge, laboratory practices, and techniques to teaching and learning continue to progress. Chemistry

teachers face the extra challenge of explaining abstract concepts such as chemical bonding, atomic structure, molecular interactions, thermodynamics,equilibrium, kinetics, and electrochemistry while also supporting learners connect these ideas to noticeable phenomena and real-world applications. The advent of Artificial Intelligence (AI) has generated new potentialities for teacher professional development. Artificial Intelligence (AI) representswildly to computational systems capable of performing tasks that conventionally require aspects of human intelligence, such as language processing, pattern recognition, content generation, prediction and decision support. Recent advances in Generative Artificial Intelligence(AI) have made these technologies approachable to teachers through conversational interfaces that can generate lesson plans, explanations,questions,simulations, examples, summaries and other educational resources. For chemistry teachers, Artificial Intelligence(AI) has particular potential because chemistry involves extensive use of symbolic language, representations, quantitative calculations, experimentation, visualization and problem-solving. Artificial Intelligence(AI) canhelp teachers in moving between microscopic, macroscopic and symbolic levels of chemical understanding. It can also help teachers design learning activities that address different abilities and learning needs. However, Artificial Intelligence(AI) should not be understood simply as one more digital tool. Its ability to generate apparently authoritative information introduces new professional responsibilities. Artificial Intelligence(AI) -generated explanations, chemical equations, laboratory procedures, numerical solutions and references may contain errors. Teachers therefore need sufficient Artificial Intelligence(AI) literacy and chemistry expertise to evaluate and adapt Artificial Intelligence(AI) -generated material. The purpose of this thematic article is to examine how AI can contribute to the professional development of chemistry teachers, identify major opportunities and challenges, and propose principles for responsible implementation.

2. Professional Development of Chemistry Teachers

Teacher professional development refers to systematic and continuous activities through which teachers enhance their professional knowledge, skills, beliefs and practices. Effective professional development is not restricted to attending occasional conference, workshops etc., It is a continuous process involving experimentation, reflection, collaboration, feedback, and application in authentic teaching contexts.

For chemistry teachers, professional development can involve many areas:

- Chemistry knowledge updating and recent scientific developments.
- Increasing pedagogical content knowledge (PCK).
- Evolving effective laboratory and inquiry-based teaching techniques.
- Learning recent approaches to assessment.
- Managing students' alternative conceptions and misconceptions.
- Integration of educational technologies into chemistry instruction.
- Developing inclusive and differentiated teaching practices.
- Reflecting systematically on classroom experiences.
- Collaborating with other chemistry teachers and professional communities.

3. AI as a Tool for Continuous Professional Learning

One of the major advantages of Artificial Intelligence (AI) is its potential to support teachers

whenever professional learning needs arise. Instead of waiting for a scheduled training programme, teachers can use Artificial Intelligence (AI) systems to explore a concept, obtain examples, generate questions, or seek alternative explanations.

For example, a chemistry teacher preparing a lesson on chemical equilibrium could ask an Artificial Intelligence (AI) system to provide: A simple description suitable for beginners, a description using particle-level reasoning, a Common student misconception, Higher-order questions, Formative assessment items, Real-world applications of equilibrium.

The teacher can then crucially evaluate these outputs and incorporate suitable ideas into the lesson. Artificial Intelligence (AI) can therefore facilitate just-in-time professional development, where learning occurs in replay to an immediate teaching requirement. This strategy may be particularly useful for teachers working in schools with limited access to subject-specific professional development programmes.

4. Artificial Intelligence (AI) Literacy as a New Dimension of Teacher Competence

The growing use of Artificial Intelligence (AI) means that chemistry teachers need more than general digital literacy. They require Artificial Intelligence (AI) literacy—the ability to understand how Artificial Intelligence (AI) systems work at a practical level, recognize their abilities and limitations, formulate productive prompts, evaluate generated information, and use Artificial Intelligence (AI) ethically.

Artificial Intelligence (AI) literacy for chemistry teachers should include:

- Understanding Artificial Intelligence (AI) Capabilities
- Evaluating Accuracy
- Prompt Design
- Ethical Use

5. Artificial Intelligence (AI) for Lesson Planning and Instructional Design

Lesson planning is a major area in which Artificial Intelligence (AI) can support chemistry teachers. Teachers can use Artificial Intelligence (AI) to brainstorm learning objectives, teaching strategies, examples, activities, assessment questions, and differentiated tasks.

The teacher remains responsible for opting and modifying the suggestions. Artificial Intelligence (AI) can lower the time required to generate initial ideas while allowing the teacher to focus on pedagogical selections. Artificial Intelligence (AI) can also assist teachers differentiate instruction. One single chemistry concept can be represented through multiple levels of complexity. Teachers can ask Artificial Intelligence (AI) to generate beginner, intermediate, and advanced questions or to provide explanations using everyday examples, diagrams, mathematical reasoning, or laboratory contexts. This can help inclusive classrooms where students have different levels of previous knowledge and learning needs.

6. Artificial Intelligence (AI) for Understanding and Addressing Chemistry Misconceptions

Chemistry is attributed by numerous persistent misconceptions. Students may misunderstand concepts such as conservation of mass, oxidation-reduction, chemical bonding, equilibrium, acids and bases, and the particulate nature of matter.

Artificial Intelligence (AI) can support teachers identify possible misconceptions by generating lists of common incorrect ideas and suggesting diagnostic questions. Teachers can

use these questions to determine students' conceptual understanding before and during instruction. Artificial Intelligence (AI) may also generate multiple explanations of a difficult concept. This can support teachers compare different pedagogical approaches and select the explanation most appropriate for their students.

However, teachers must verify Artificial Intelligence (AI) generated descriptions because an Artificial Intelligence (AI) system can itself reproduce misconceptions or oversimplifications.

7. Artificial Intelligence (AI) -Supported Assessment and Feedback

Assessment is another very important area for professional development. Artificial Intelligence (AI) can help teachers develop formative and summative assessment materials, including multiple-choice questions, numerical problems, short-answer questions, conceptual questions, and higher-order thinking tasks. Artificial Intelligence (AI) can also assist in generating feedback. For example, teachers can provide anonymized learner responses and ask an Artificial Intelligence (AI) system to identify patterns of errors or suggest feedback techniques. The teacher should review the suggestions before providing feedback to students.

The professional value of Artificial Intelligence (AI) in assessment therefore extends beyond saving time. It can support teachers reflect on the quality, validity, balance and cognitive demand of their assessments.

8. Artificial Intelligence (AI) and Chemistry Laboratory Education

Laboratory work is essential to chemistry education. Teachers must plan meaningful, safe and educationally effective experiments. Artificial Intelligence (AI) can support laboratory preparation by helping teachers predict observations, generate experimental questions, prepare pre-laboratory questions, develop post-laboratory activities, and identify possible sources of experimental error. Artificial Intelligence (AI) can also assist in designing virtual or simulated laboratory experiences. Such resources may be useful when laboratory facilities are limited, when an experiment is too expensive or hazardous for routine classroom use, or when students need opportunities to rehearse procedures before entering the laboratory. Artificial Intelligence (AI) should complement—not replace—hands-on laboratory experiences wherever practical and safe.

9. Artificial Intelligence (AI) for Collaborative Professional Learning

Professional learning is often more effective when teachers collaborate. AI can support professional learning communities by helping teachers develop discussion questions, compare lesson approaches, analyze teaching scenarios, and generate collaborative tasks.

A group of chemistry teachers could use AI to examine a common instructional challenge, such as students' difficulty understanding mole calculations. Teachers might independently develop strategies and then use AI to generate alternative approaches. The group can compare these ideas, evaluate them using their classroom experience, and develop a shared intervention. This model positions AI as a **discussion partner** rather than an authority. The expertise remains within the professional community, while AI expands the range of possibilities considered.

10. Artificial Intelligence (AI) for Reflective Practice

Reflective practice is central to professional growth. Teachers improve when they systematically examine what happened during a lesson, why it happened, and how future

teaching could be improved. However, reflective practice should remain teacher-driven. Artificial Intelligence (AI) should not determine whether a teacher's lesson was successful without contextual understanding.

11. Personalized Professional Development Pathways

Artificial Intelligence (AI) can potentially help individualized professional development. Teachers have different levels of experience, technological confidence, subject expertise and professional goals. An experienced chemistry teacher may want to explore advanced assessment practices, while an early-career teacher may need support with lesson planning, classroom management or fundamental pedagogical techniques.

Artificial Intelligence (AI) can support teachers identify learning goals and generate individualized sequences of professional learning activities.

12. Challenges and Risks of Artificial Intelligence (AI) in Teacher Professional Development

Despite its potential, Artificial Intelligence (AI) presents significant challenges.

- Perfection and Hallucination
- Overdependence
- Academic Integrity
- Data Privacy
- Bias
- Digital Inequality
- Loss of Human Interaction

13. Recommendations for Institutions and Teacher Educators

Schools, universities, and educational organizations should consider the following measures when introducing Artificial Intelligence (AI) into chemistry teacher professional development:

- Develop Artificial Intelligence (AI) literacy programmes specifically designed for teachers.
- Include chemistry-specific examples rather than relying only on generic Artificial Intelligence (AI) training.
- Provide opportunities for hands-on experimentation with Artificial Intelligence (AI) tools.
- Emphasize verification of Artificial Intelligence (AI) -generated scientific information.
- Develop institutional guidelines for responsible AI use.
- Protect teacher and student data.
- Encourage professional learning communities and peer collaboration.
- Provide mentoring for teachers who are less confident with technology.
- Evaluate the impact of Artificial Intelligence (AI) -supported professional development on classroom practice.
- Maintain opportunities for human-led workshops, mentoring, laboratory training, and professional dialogue.

Professional development should focus not simply on learning how to operate Artificial

Intelligence (AI) tools but on understanding when, why, and how Artificial Intelligence (AI) should be used.

14. Conclusion

Artificial Intelligence (AI) offers significant opportunities for the professional development of chemistry teachers. It can help continuous learning, lesson planning, differentiation, assessment, misconception analysis, collaboration, laboratory preparation and reflective practice. By providing rapid access to ideas and resources, Artificial Intelligence (AI) can make professional learning more flexible and personalized. However, Artificial Intelligence (AI) is not a substitute for chemistry expertise, professional judgement, pedagogical knowledge or human relationships. Its outputs may contain biases, inaccuracies or inappropriate recommendations. Responsible use therefore requires teachers to develop strong Artificial Intelligence (AI) literacy and maintain a critical approach to generated content. The effective integration of Artificial Intelligence (AI) into chemistry teacher professional development should be based on partnership rather than replacement. Teachers should remain the decision-makers, while Artificial Intelligence (AI) functions as a tool for exploration, creativity, reflection and efficiency. Professional development programmes should combine Artificial Intelligence (AI) literacy with chemistry-specific pedagogy, collaborative learning, ethical awareness and reflective practice. Ultimately, the importance of Artificial Intelligence (AI) in chemistry education will depend not on how much technology teachers use, but on how purposefully and critically they use it. When supported by suitable training, professional communities, institutional policies and ethical principles, Artificial Intelligence (AI) can become a powerful component of continuous lifelong professional development and contribute to a more inclusive, innovative and effective chemistry education system.

THE DIGITAL DIVIDE AND THE ETHICS OF AI IN GLOBAL EDUCATION: ENSURING EQUITABLE ACCESS IN DEVELOPING CONTEXTS OF INDIA

Dr. Lami M.C
Assistant Professor, Yenepoya Institute of Technology, Moodbidri, Mangalore

Abstract

The rapid introduction of Artificial Intelligence (AI) in education promises personalized learning and lower administrative burdens. However, in developing nations like India, these technological advances run directly into deep social and economic inequalities. This thematic paper looks at the intersection of the digital divide and the ethical concerns regarding AI integration in Indian education. Drawing on empirical data, national sample surveys, institutional studies, and doctoral research studies (e.g., ASER Centre, 2023; MoSPI, 2022; Azim Premji Foundation, 2021; Sharma, 2021; Wakude, 2022), this paper outlines how structural gaps like unstable internet connectivity, gender disparities in phone ownership, and a lack of regional language content turn AI in to a source of inequality. This paper offers practical policy suggestions grounded in India's National Education Policy (NEP 2020) and the IndiaAI Mission to help build an ethical, inclusive, and decentralized AI learning model.

Keywords: *Digital Divide, AI Ethics, Digital Equity, NEP 2020*

1. Introduction

Artificial Intelligence is moving from experimental lab settings to the mainstream classrooms. Intelligent Tutoring Systems (ITS), automated grading programs, and adaptive learning apps are often pitched as the ultimate fix for long-standing issues in global education especially in large class sizes, shortages of trained teachers, and unequal access to quality learning materials (UNESCO, 2023). In developing countries, this use of AI sounds convincing (NITI Aayog, 2021). India, for instance, faces a huge gap in educational infrastructure, particularly across its rural settings. Yet, bringing AI into a deeply unequal society comes with significant compromises. Technology does not operate in a vacuum but it takes on the biases and inequalities of the environment where it is deployed (Rani, 2020). If a student lacks a stable internet connection or a smartphone, advanced AI learning tools remain completely out of reach. When AI is rolled out without fixing these structural gaps, it risks widening the divide between privileged urban students and marginalized rural learners (Oxfam India, 2020; Sharma, 2021). The traditional mindsets of teachers, parents and other stakeholders at certain extend expands the digital divide in the use of smartphones in classes and before a certain age group. Hence, this paper explores the realities of the digital divide in India, examines the ethical risks of using AI in under-resourced schools, and suggests ways to ensure technological progress does not leave vulnerable communities behind.

2. The Digital Divide in India

The Digital Divide refers to the gap between individuals, households, socioeconomic groups, or geographic areas that have full access to modern information and communication technology (ICT) and those who do not have access to that (Lythreatis et al., 2022). Hence, to

understand whether AI can realistically improve Indian education, we first need to look at the physical and socio-economic infrastructure already on the ground. The digital divide in India is not just about having or not having a computer; it involves distinct layers: connectivity, hardware ownership, digital literacy, and gender-based access (Athreya & Simha, 2025; Wakude, 2022) to technologies and gadgets. This widens the gap and the digital divide. Three Core Dimensions of the Gap are,

-Access Gap (First-Level Divide) : Lack of physical infrastructure, high-speed broadband, or affordable devices (laptops, smartphones).

-Use Gap (Digital Literacy- Second-Level Divide)): Possessing hardware but lacking the skills, training, or confidence to navigate software, search effectively, or utilize digital platforms (Lythreatis et al., 2022).

-Quality Gap (Third-Level Divide): Differences in connection stability, speed, and device processing power (e.g., dial-up/low 3G speed vs. high-speed fiber internet) (Lythreatis et al., 2022).

The major reasons for these divide are Socioeconomic status, geographic location, and age and Education

2.1 Rural-Urban and Socio-Economic Gaps

While India has over 600 million internet users, internet penetration is spread very unevenly. A thorough study of Government and empirical research studies show a persistent gap between cities and villages (Kaur & Singh, 2016; Wakude, 2022):

- **Broadband Penetration:** Rural broadband penetration sits at around 29%, compared to a national average of 51% (PIB, 2026)
- **Household Device Access:** A landmark study by the Azim Premji Foundation (2021) revealed that almost 60% of school children in India could not access online learning opportunities during remote schooling shifts. Data from the Annual Status of Education Report (ASER Centre, 2023) shows that while smartphone ownership at home grew to over 67% in recent years, less than 20% of young children in primary grades had dedicated access to a device when they actually needed it for studying. Research on rural school infrastructure similarly highlights that shared family devices rarely translate to effective study access for children (Sharma, 2021). This creates inefficiency in the globalisation of education through technology.
- **Economic Cost Burden:** Data charges in India are relatively cheap per gigabyte, but for households earning less, buying routine data packages consumes roughly 3% of their monthly income compared to just 0.2% for middle-class households (Oxfam India, 2020). High-speed internet required for running complex generative AI applications remains an expensive luxury for poorer families especially in the rural and tribal areas.

2.2 The Gender and Digital Literacy Divide

The gap gets even wider when we factor in gender and functional literacy:

- **Gender Disparity:** According to joint studies by ICRIER and LIRNEasia (2021) and doctoral findings from different research studies on gendered technology adoption (Rani, 2020), Indian women are 15% less likely to own a mobile phone and 33% less

likely to use mobile internet than men. In rural homes with only one shared mobile phone, male children are almost always given priority for online classes and study tools (Kaur & Singh, 2016).

- **Functional Digital Literacy:** National Sample Survey data from the Ministry of Statistics and Programme Implementation (MoSPI, 2022) indicates that while around 20% of the overall population aged 5 and above possesses basic digital literacy, only 40% of youth aged 15–29 can operate a computer or use the internet in computers effectively. Basic digital literacy is an absolute requirement before anyone can meaningfully use AI-driven educational software (Wakude, 2022).

3. Ethical Dimensions of AI in Developing Educational Contexts

When AI tools are layered onto these structural inequalities, several ethical problems emerge.

3.1 Algorithmic Bias and Linguistic Exclusion

Most Large Language Models (LLMs) and educational AI algorithms are trained on datasets sourced heavily from Western, English-speaking contexts (UNESCO, 2023).

- **Linguistic Isolation:** India has 22 officially recognized languages and hundreds of dialects. AI models trained primarily on English fail to grasp regional context, local syntax, and cultural nuances. A student learning in Hindi, Marathi, or Tamil often gets less accurate output from AI tools compared to a student querying in English (Athreya & Simha, 2025; Wakude, 2022). Recent studies show lesser gap in this regard.
- **Reinforcing Social Hierarchies:** Automated scoring systems and predictive performance tools learn from historical data. If historical school data contains bias against lower-caste, tribal, or low-income students, the AI can end up grading their work more harshly or falsely flagging them as "high-risk dropouts" (NITI Aayog, 2021; Sharma, 2021).

3.2 Surveillance, Data Privacy, and Consent

To deliver personalized learning, EdTech applications collect huge amounts of personal data, including real-time facial expressions, reaction times, location details, and test performance.

- **Lack of Informed Consent:** In rural and under-resourced Indian schools, both parents and teachers often lack the digital literacy to understand complex privacy disclosures (ICRIER & LIRNEasia, 2021). Student data is routinely collected without meaningful informed consent.
- **Biometric Risks:** The expansion of facial recognition for tracking attendance creates serious privacy concerns. Without strict compliance with India's Digital Personal Data Protection (DPDP) framework, young students face the risk of having their personal data leaked or commercialized (Oxfam India, 2020; Rani, 2020).

3.3 Commercial Dominance and the "Corporate EdTech" Model

During periods of sudden digital migration, private EdTech platforms expanded rapidly across India.

- **EdTech Exploitation:** Studies on aggressive marketing tactics by commercial EdTech companies highlight how low-income families are pushed into expensive subscription models under the promise of "AI-driven success" (Azim Premji Foundation, 2021; Wakude, 2022). Illiterate or less qualified parents, for the better future of their wards,

unwittingly fell into the traps of such Advertisement. Relying heavily on private AI apps shifts the core responsibility of teaching away from state-funded public schools into the hands of profit-driven corporations. This creates a two-tiered system: wealthy students enjoy human-led teaching alongside advanced AI tools, while poorer students are left with low-cost, automated digital software with little to no human guidance (UNESCO, 2023). In bargain of searching for cheaper or economical ways , they end-up in inefficient tools or EdTechs.

4. Government Policies and Institutional Initiatives

The Indian government has recognized some of these gaps and introduced national initiatives aimed at balancing innovation with access:

Initiative	Key Objectives	Equity & Ethical Impact
National Education Policy (NEP) 2020	Promotes technology integration while warning against the digital divide; calls for multilingual content.	Sets up the National Educational Technology Forum (NETF) to guide decisions on tech adoption. MHRD (2020)
DIKSHA & e-PG Pathshala	Open-source national platforms offering free curriculum content across multiple Indian languages.	Reduces reliance on private subscriptions; archived across Shodhganga as key public IR tools. MHRD (2020); Wakude (2022)
IndiaAI Mission (2024–2026)	Multi-crore funding to build computing infrastructure, support AI startups, and develop public AI tools.	Focuses on creating open-source Datasets and localized LLMs tailored to Indian regional languages. PIB (2026)
PM Gati Shakti & BharatNet	Infrastructure push to lay fiber optic networks across all Gram Panchayats (village councils).	Aims to solve the baseline problem: getting stable internet to remote schools. PIB (2026)

Frameworks for Ethical Governance: The UNESCO 5C Model

To mitigate the vulnerabilities, international regulatory have evolved from abstract principles to actionable competencies. UNESCO's normative suite anchored by the *Recommendation on the Ethics of Artificial Intelligence* and complemented by the *AI Competency Frameworks for Teachers and Learners* establishes a human-centered approach to digital transformation.

Core Pillar	Strategic Operational Focus
1. Coordination	Sovereign policy alignment, ethical oversight bodies
2. Content	Culturally relevant, multi-lingual open-source models
3. Capacity	Pedagogical AI literacy for teachers and students
4. Connectivity	Public investments in rural grid & internet access
5. Cost	Sustainable funding models to prevent long-term debt

Under this framework, it does not replace teachers but teachers are recontextualized as ethical mediators who guide students through algorithmic outputs, identifying bias, and protecting

critical inquiry.

5. Recommendations for Equitable and Ethical AI Integration

To ensure AI works as a bridge rather than a wall in Indian education, policy makers, schools, and developers should focus on these practical priorities:

1. **Invest in Infrastructure:** AI software is useless without physical access. Priority funding must go toward completing the BharatNet rural broadband push and supplying public schools with solar-powered devices and reliable electricity (PIB, 2026; Sharma, 2021).

- **Build Local Language Datasets, Open-Source, Multilingual AI Models:** AI tools should be built using open-source architectures trained on localized datasets. Initiatives like Bhashini (India's AI-based language translation mission) need to be integrated directly into educational apps so students can learn comfortably in their native language (NITI Aayog, 2021; Wakude, 2022). Allocate public research grants toward digitizing, curating, and open-sourcing high-quality educational text and audio corpora in regional and indigenous languages.
- **Shift Focus from Technical Literacy to Critical AI Literacy:** Teacher training programs must move beyond operational instruction (how to type a prompt) to focus on critical evaluation. Teaching educators how to interrogate model assumptions, identify hallucinations, and protect student privacy.

2. **Prioritize Offline-First AI Architectures:** Tech developers should build lightweight, edge-computed AI models that can run on simple devices without requiring constant high-speed internet (Athreya & Simha, 2025).
3. **Mandate Algorithmic Audits and Data Protection:** Educational AI software used in schools should undergo mandatory bias and privacy checks. Automated systems must never be used as the sole decision-maker for grading, scholarship selection, or admissions (UNESCO, 2023; Rani, 2020).
4. **Teacher Empowerment Over Replacement:** AI should serve as an assistant to the teacher, not a substitute. Teacher training programs must include digital ethics and practical skills on how to use AI tools effectively alongside regular classroom teaching (MHRD, 2020; Sharma, 2021).
5. **Implement Strict Data Sovereignty Laws:** Establish legal protections that forbid multinational EdTech vendors from exporting student usage data outside national borders or leveraging non-consensual learner data to train commercial models.

6. Conclusion

AI offers real potential to broaden learning opportunities, but using it ethically in a country as diverse as India requires careful planning. If we ignore existing structural issues like poor connectivity, limited device access, and language barriers, AI will surely replicate and speed up existing social inequalities. Bridging the digital divide is not just a technical task; it is an ethical duty. By prioritizing public digital infrastructure, open-source localized software, strong privacy safeguards, and teacher training, India can build an educational model where AI serves every student, regardless of their locality or socio-economic background.

AI-ENHANCED FORMATIVE ASSESSMENT AND EXPLAINABLE LEARNING ANALYTICS IN SECONDARY MATHEMATICS: A TEACHER-DRIVEN SMART-AI FRAMEWORK FOR ACHIEVEMENT, CRITICAL THINKING AND SOCIAL SKILLS

Lokeshkumar V
Research Scholar & Assistant Professor BGS College of Education, Adichunchanagiri University lokeshv7676@gmail.com
Dr A T Shivaramu
Research Guide & Principal BGS College of Education, Adichunchanagiri University

Abstract

Artificial intelligence (AI) is increasingly transforming educational assessment through automated feedback, prediction, learner modelling, and learning analytics. However, its educational value depends not only on data analysis but also on teachers' ability to interpret evidence and translate it into appropriate pedagogical action. This conceptual paper presents the SMART-AI Mathematics Framework as a novel teacher-driven model integrating AI-enhanced formative assessment, explainable learning analytics, teacher professional judgement, and social constructivist mathematics pedagogy. The framework addresses the gap between assessment evidence and instructional action through a seven-stage Smart Teacher Assessment Cycle: Assess, Analyze, Diagnose, Adapt, Scaffold, Collaborate, and Reassess. AI-supported analytics identifies learning patterns, gaps, and potential misconceptions, while explainable analytics provides interpretable evidence to support teacher decision-making. Teachers then adapt instruction through collaborative problem solving, peer explanation, mathematical dialogue, scaffolding, and argumentation. The framework focuses on three key student outcomes: mathematics achievement, critical thinking, and social skills. It positions AI as an evidence-support mechanism rather than an autonomous teacher and conceptualizes the smart teacher as AI-literate, assessment-literate, data-informed, and ethically responsible. The paper concludes by proposing empirical validation through quasi-experimental and mixed-methods research.

Keywords: *Artificial intelligence, formative assessment, learning analytics, mathematics education, critical thinking, social skills, teacher professional judgement, social Constructivism.*

1. Introduction

Artificial intelligence (AI) is increasingly transforming educational assessment, feedback, learning analytics and instructional decision-making. Its educational value, however, depends not only on technological capability but also on teachers' ability to interpret AI-generated evidence and make ethical, informed pedagogical decisions (Miao & Cukurova, 2024).

Formative assessment is particularly important in mathematics education, where understanding involves conceptual knowledge, procedural skills, reasoning, problem-solving and communication. AI-enhanced assessment can identify learning patterns, errors and misconceptions, while learning analytics can organize this evidence to support timely instructional decisions (Maskos et al., 2025; Paulsen & Lindsay, 2024). However, predictions and analytics become meaningful only when teachers critically interpret them and connect

them with classroom evidence. A human-centred approach therefore positions AI as a support mechanism rather than a replacement for teacher judgement. In mathematics classrooms, AI-supported evidence can help teachers identify students' needs and provide differentiated scaffolding, collaborative problem-solving opportunities, and mathematical discussion and peer learning. Against this background, the present conceptual paper proposes the **SMART-AI Mathematics Framework**, which integrates **AI-enhanced formative assessment, explainable learning analytics, teacher professional judgement, and social constructivist mathematics pedagogy**. It introduces a seven-stage **Smart Teacher Assessment Cycle: Assess, Analyze, Diagnose, Adapt, Scaffold, Collaborate and Reassess**. The framework aims to connect AI-supported evidence with teacher-driven instructional action to enhance **mathematics achievement, critical thinking and social skills** among secondary school students. Accordingly, the purpose of this conceptual paper is **to propose and theoretically articulate a teacher-driven framework for integrating AI-enhanced formative assessment and explainable learning analytics with social constructivist mathematics pedagogy to support mathematics achievement, critical thinking and social skills among secondary school students**.

2. Conceptual and Theoretical Foundations

The **SMART-AI Mathematics Framework** is based on four key foundations: **human-centred AI, formative assessment, explainable learning analytics, and social constructivism**. AI can support prediction, assessment, feedback and pattern recognition, but it should enhance rather than replace teachers. UNESCO emphasises human agency, ethics and professional judgement in AI-supported education. Formative assessment provides evidence of students' learning and guides subsequent instruction (Black & Wiliam, 2009). AI and learning analytics can strengthen this process by identifying performance patterns, misconceptions and learning gaps. **Explainable learning analytics** makes AI-generated evidence understandable, enabling teachers to critically evaluate and use recommendations. The framework also draws on **Vygotsky's (1978) social constructivism**, emphasising collaboration, scaffolding, peer learning, discussion and mathematical reasoning. The theoretical process is:

AI identifies evidence → Teacher interprets evidence → Social constructivist pedagogy addresses learning needs.

Thus, the **Smart Teacher** requires five competencies: **assessment literacy, AI literacy, learning analytics literacy, pedagogical judgement and ethical AI literacy**.

3. Research Gap and Rationale

Existing research on **formative assessment, AI, learning analytics, explainability and social constructivist mathematics pedagogy** is largely fragmented. Limited attention has been given to integrating these components into a unified, teacher-driven process. In particular, the link between **explainable AI evidence and teachers' formative instructional decisions** remains underdeveloped. Ethical issues such as privacy and responsible use of student data also require attention. Therefore, the paper addresses an **integration gap** by connecting:

AI-enhanced formative assessment + Explainable learning analytics + Teacher judgement + Social constructivist mathematics pedagogy.

4. Originality and Conceptual Contribution

The originality of the paper lies in integrating previously fragmented elements into a teacher-driven framework for secondary mathematics education**. The proposed framework connects AI-supported learning evidence, explainable analytics, teacher professional judgement, and social learning to support** mathematics achievement, critical thinking, and social skills**. It introduces two conceptual elements: the** SMART-AI Mathematics Framework**, comprising** Student Learning Evidence, Machine/AI Analytics, Actionable Explain ability, Responsive Teacher Decision-Making, and Transformative Social Learning**, and the** Smart Teacher Assessment Cycle**, comprising** Assess, Analyze, Diagnose, Adapt, Scaffold, Collaborate, and Reassess**. Together, these elements position AI as a support mechanism for evidence-based teaching rather than as a replacement for teachers. These propositions are developed through synthesis of existing literature and require empirical validation in secondary mathematics classrooms.**

5. SMART-AI Mathematics Framework

The **SMART-AI Mathematics Framework** presents a continuous process linking formative assessment, AI analytics, teacher judgement and social learning. **Student Learning Evidence** is collected through mathematical responses, errors, reasoning and learning progress. **Machine/AI Analytics** identifies patterns, misconceptions and learning gaps. **Actionable Explain ability** provides understandable evidence behind AI-generated insights.

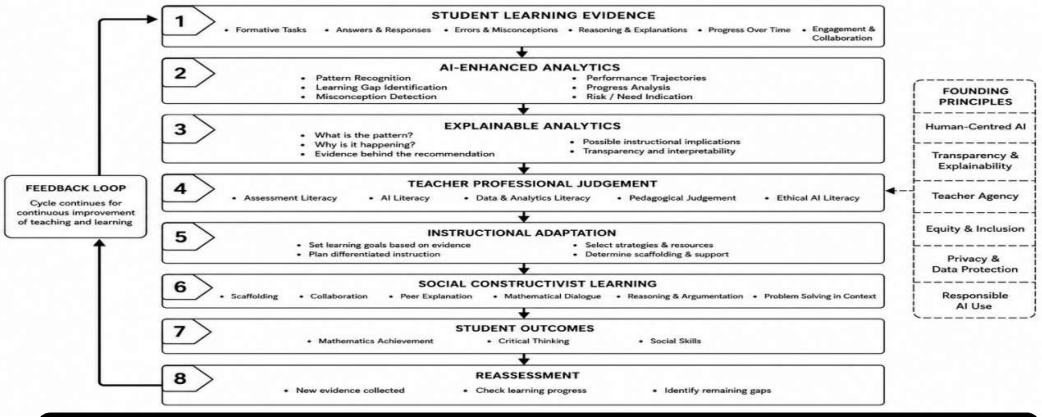
Teachers then use **Responsive Teacher Decision-Making** to interpret the evidence and adapt instruction. Students participate in **Transformative Social Learning** through collaboration, discussion, peer explanation, scaffolding and problem-solving.

The framework operates through the cycle:

Assess → Analyse → Diagnose → Adapt → Scaffold → Collaborate → Reassess → Repeat

Thus, SMART-AI positions **AI as an evidence-support tool, the teacher as the central decision-maker, and students as active participants in mathematical learning**.

SMART-AI Mathematics Framework



The SMART-AI Mathematics Framework integrates **AI-enhanced formative assessment, explainable learning analytics, teacher professional judgement, and social constructivist pedagogy in a continuous cycle to enhance**

6. Contribution to Assessment, Evaluation and Learning Analytics

The framework has direct relevance to the conference sub-theme.

Component	Function
Assessment	Generates evidence of current learning
Analytics	Identifies patterns and possible learning gaps
Explain ability	Makes analytical evidence interpretable
Evaluation	Teacher evaluates evidence and instructional response
Adaptation	Instruction is modified
Social learning	Students engage collaboratively
Reassessment	New evidence evaluates progress

The integrated process is:

Assessment → Evidence → Analytics → Explanation → Teacher Judgement → Action → Evaluation → Reassessment

This represents a conceptual shift from **assessment of learning** towards **assessment for responsive learning**.

7. Ethical and Responsible AI

The use of AI-supported assessment with school students requires **ethical, responsible, and human-centred practices**. Student data should be collected only for legitimate educational purposes and protected to ensure privacy and security. AI recommendations should be **transparent, explainable, and monitored for bias and inequity**, while following the principle of data minimization. **Human agency** must remain central, with teachers critically evaluating AI-generated information rather than relying on it blindly. Students should not be permanently labelled as "weak," "low ability," or "at risk" based solely on algorithmic predictions. Since AI systems may produce inaccurate, incomplete, or biased outputs, teachers must maintain **human oversight, professional judgement, and ethical responsibility** (Kasneci et al., 2023; Farrokhnia et al., 2024).

8. Implications for Teacher Education

The proposed framework has important implications for **B.Ed. and teacher-education programmes**, requiring a shift from basic digital competence towards **Pedagogical-AI Assessment Knowledge (PAAK)**, conceptualised as **Pedagogical Knowledge + Assessment Literacy + AI Literacy + Data Literacy + Ethical Reasoning**. Teacher education should therefore prepare student teachers in AI fundamentals, formative assessment, learning analytics, data interpretation, explainable AI, AI-output evaluation, ethics, privacy, differentiated instruction, collaborative learning and mathematical reasoning. A **Smart Teacher** should critically evaluate AI-generated evidence, question the basis of recommendations, consider alternative explanations, relate AI findings to classroom observations, and select appropriate instructional responses without labelling students. Thus, AI should function as a **decision-support tool** while teachers retain professional autonomy, ethical responsibility and pedagogical judgement.

9. Limitations

This paper has several **limitations**. First, the **SMART-AI Mathematics Framework** is conceptual and has not yet been empirically validated; therefore, its proposed relationships

cannot be considered causal. Second, its effectiveness may depend on the **quality of assessment data, AI accuracy, teacher AI competence, technological infrastructure, and classroom context**. Third, explain ability may improve transparency but does not guarantee appropriate teacher decisions, which depend on teachers' assessment and pedagogical expertise. Fourth, learning analytics raises concerns regarding **student privacy, algorithmic bias, and equity**. Finally, both the **PAAK construct and SMART-AI framework require systematic empirical validation** across diverse educational contexts before being established as robust theoretical and practical models.

10. Future Empirical Validation

The proposed framework can be empirically examined in secondary mathematics education using a **quasi-experimental pretest–posttest non-equivalent control-group design**. The experimental group may receive AI-enhanced formative assessment with explainable learning analytics, teacher-led instructional adaptation, and social constructivist pedagogy, while the comparison group follows conventional instruction. Key outcomes may include **mathematics achievement, critical thinking, and social skills**, along with teacher instructional adaptation, AI literacy, student engagement, and learning progression. Data may be analysed using **ANCOVA/MANCOVA, effect-size, regression, and mediation analyses**. Future research should examine whether learning gains result directly from AI or from **teachers' improved pedagogical decisions based on interpretable AI evidence**. The framework emphasises the latter, positioning AI as a support mechanism that strengthens **teacher professional judgement and instructional decision-making**.

11. Conclusion

Artificial Intelligence has significant potential to strengthen assessment and learning analytics in secondary mathematics education, but technology alone cannot guarantee improved learning. The **SMART-AI Mathematics Framework** integrates **AI-enhanced formative assessment, explainable learning analytics, teacher professional judgement, social constructivist pedagogy, and reassessment** through the cycle: **Assess → Analyse → Diagnose → Adapt → Scaffold → Collaborate → Reassess**. Its central contribution is to position **AI as an evidence-support tool rather than an autonomous teacher**, with teachers retaining responsibility for interpretation, ethical decision-making and instructional adaptation. Through collaboration, scaffolding, mathematical dialogue and reasoning, the framework aims to support **mathematics achievement, critical thinking and social skills**. Thus, the SMART-AI framework provides a conceptual foundation for future empirical research and contributes to the field of **Assessment, Evaluation and Learning Analytics**.

GENERATIVE ARTIFICIAL INTELLIGENCE IN COMMERCE EDUCATION: TRANSFORMING TEACHING AND LEARNING FOR THE FUTURE

Ramyashree. S.R
Lecturer, N.E.S. Institute of Advanced Studies, Shivamogga, ramyashreekar14@gmail.com
Vagdevi Madhyastha
Lecturer, N.E.S. Institute of Advanced Studies, Shivamogga, vagdevimadhyastha@gmail.com

Abstract

The advent of Generative Artificial Intelligence (GenAI) has fundamentally reshaped the landscape of higher education, particularly in specialized academic domains such as commerce education. This paper seeks to explore the pedagogical potential of leveraging emerging AI tools, including ChatGPT, Google Gemini, and Microsoft Copilot, to transform teaching/learning practices in commerce education, with a focus on accounting, finance, business economics, taxation, and management studies. By undertaking a conceptual and pedagogical inquiry, this paper aims to contribute an understanding of how best GenAI can be integrated into commerce education while simultaneously navigating the accompanying opportunities, challenges, and risks. Ultimately, this paper provides a set of recommendations for achieving responsible integration of GenAI into commerce education.

Keywords: *Generative artificial intelligence, Commerce education, Teaching and learning, Higher education, Academic integrity, Pedagogical innovation*

1. INTRODUCTION

The emergence of Generative Artificial Intelligence (GenAI) represents one of the most significant developments in higher education in the post-internet era. With the proliferation of AI tools capable of performing diverse functions ranging from text generation to mathematical computations, simulations, and even the creation of case studies with a high degree of accuracy, there is growing interest in the potential of these technologies to disrupt traditional areas of higher education, with commerce education being among the most affected. Commerce education typically encompasses disciplines such as accounting, finance, banking, taxation, business law, marketing, and economics, all of which have relied on a set of established principles and procedural frameworks. As such, the application of GenAI in this field warrants a careful and nuanced consideration. With the increasing adoption of automation and digital technologies in the workplace, students pursuing careers in commerce-related fields can expect to encounter a professional environment in which AI-driven technologies are pervasive. In this context, it is important that educational institutions embrace GenAI as a pedagogical tool to prepare students for the realities of the modern workplace. While the potential of GenAI to enhance the quality of education is undeniably compelling, there are also concerns about its potential to facilitate academic dishonesty and undermine the integrity of the learning process. This paper aims to elucidate upon the pedagogical potential of GenAI while also considering the limitations, challenges, and risks that it presents.

1.1. OBJECTIVES OF THE STUDY

This paper aims to achieve the following objectives:

- Examine the role of GenAI tools in enhancing teaching and learning in commerce education.
- Explore the pedagogical opportunities and innovations enabled by GenAI.
- Discuss the challenges and risks associated with GenAI in commerce education.
- Propose recommendations for responsible GenAI integration into commerce education.

1.2. SIGNIFICANCE OF THE STUDY

This paper contributes to the growing literature on the role of artificial intelligence in higher education, with a specific focus on Generative AI and commerce education. While there is a wealth of research on the applications and implications of AI in higher education, few studies have focused on the unique applications and opportunities that GenAI presents in commerce education, which this paper aims to address.

1. LITERATURE REVIEW

Zawacki-Richter, Marín, Bond & Gouverneur (2019) This systematic review found that pre-ChatGPT AI research in higher education focused mainly on predicting student performance, adaptive learning, and automated grading, with little attention to pedagogy or ethics.

Kasneci et al. (2023) The study highlighted ChatGPT-like tools' ability to personalize explanations and generate content, while warning of risks like inaccurate outputs, bias, and overreliance that could weaken independent thinking.

Chan & Hu (2023) Surveying university students, this study found generally positive attitudes toward generative AI as a learning aid, alongside concerns about fairness, overdependence, and unclear institutional policies.

Dwivedi et al. (2023) Drawing on multidisciplinary expert views, this synthesis concluded that conversational AI offers real value but poses risks to integrity, employment, and data governance, calling for discipline-specific adoption.

Rasul et al. (2023) Focused on higher education, this review identified benefits such as round-the-clock tutoring and reduced faculty workload, but cautioned against erosion of student judgment and urged further empirical research.

3. DISCIPLINE WISE APPLICATIONS OF GENAI IN COMMERCE EDUCATION

3.1 Accounting and Auditing

GenAI can Explaining Ind AS/US GAAP, generating journal entry/reconciliation practice questions, audit report simulations.

Recommended AI Tools: Microsoft Copilot (Excel), ChatGPT, Claude, CCH iKnowConnect.

Copilot works natively in Excel for journal entries/reconciliations; ChatGPT and Claude are strong for explaining standards in depth and generating varied practice scenarios; CCH iKnowConnect is purpose-built for accounting/audit research and reduces hallucination on technical standards.

3.2 Finance and Financial Modelling

GenAI can potentially be used to Spotting spreadsheet errors, explaining CAPM/DCF, ESG analysis, fraud detection, sentiment analysis.

Recommended AI Tools: Microsoft Copilot (Excel), ChatGPT, Google Gemini, Bloomberg GPT. Copilot audits formulas directly in the model; ChatGPT/Gemini handle conceptual walkthroughs and sentiment-analysis exercises well; Bloomberg GPT is trained specifically on financial data, useful for exposing students to industry-grade tools.

3.3 Marketing and Management

GenAI can be used to generate case studies, client overviews, and even AI-powered negotiation simulations to help students develop their skills in these areas. The rise of artificial intelligence has also prompted the emergence of a "feeling economy", wherein human skills such as managing, negotiating, and communicating have become increasingly important. Interestingly, there is potential to leverage GenAI to support students in developing these "human skills".Recommended AI Tools: Google Gemini, ChatGPT (voice/roleplay mode), Claude, Character.AI Gemini and ChatGPT support extended conversational roleplay for negotiation practice; Claude is strong for nuanced, longer case-study writing; Character.AI allows more customizable persona-based simulations for client interactions

3.4 Business Economics

GenAI can be used to generate graph-based questions in business economics, as well as explain economic concepts using metaphors and analogies to aid comprehension. Additionally, students can use GenAI to gain a deeper understanding of economic news and reports. Recommended AI Tools: ChatGPT (GPT-4-class), Google Gemini, Wolfram Alpha (for graphing/computation), Perplexity AI (for real-time economic news analysis)

ChatGPT and Gemini generate graphs and analogies well; Wolfram Alpha adds precise mathematical/graphical rigor; Perplexity is useful for grounding economic news discussion in current, cited sources rather than the model's static training data

3.5 Business Law and Taxation

GenAI can be used to explain legal/tax concepts, frequent amendments to statutes and regulations, sensitivity to outdated statutes.

Recommended AI Tools: ChatGPT, Google Gemini, CoCounsel (Thomson Reuters), Harvey AI (legal-specific)

General tools are useful as first-draft generators; CoCounsel and Harvey AI are purpose-built for legal research with tighter sourcing to current statutes, better suited to the paper's specific concern about regulatory obsolescence — though even these still require cross-verification against official government sources.

2. OPPORTUNITIES FOR TEACHING AND LEARNING OFFERED BY GENERATIVE ARTIFICIAL INTELLIGENCE

- **Personalised and Adaptive Learning Experiences:** Gen AI can be utilized to offer students with individualized learning experiences depending on their particular needs. For instance, if a student is struggling with a particular topic, such as cost accounting, the teacher can use Gen AI to help explain the subject matter in greater depth, generate practice questions and even produce revision notes based on the student's needs.
- **Case Study and Simulation-Based Learning:** Most disciplines within commerce education involve a significant emphasis on case studies as a tool for facilitating experiential learning and encouraging students to think critically. Gen AI can be leveraged to generate

business cases based on real-world scenarios, which can then be utilized to facilitate class discussions and encourage students to apply their knowledge to solve practical problems.

- **Research Support and Writing Assistance:** Students often have to conduct research, write essays or even complete dissertations as part of their coursework, which can be a challenging undertaking. In this context, Gen AI can be utilized to help students conduct literature reviews, organize their thoughts, develop outline proposals for their research, as well as write their essays and reports, thus saving them a significant amount of time and effort, as well as helping them improve their writing skills.
- **Automated Formative Assessments:** Educators can utilize Gen AI to develop quizzes, assessments, grading rubrics, and comment banks to help grade students' work, thus saving them time and effort while also enabling them to provide students with timely and constructive feedback. Additionally, automated assessments can help ensure consistency in grading practices, particularly in large classes.
- **Financial Modeling and Data Analysis Support:** When combined with spreadsheet processors such as Excel, Gen AI can help students conduct data analysis and generate financial forecasts, thus preparing them for careers in finance, as well as business analytics.
- **Language and Communication Support:** For non-native English speakers, writing assignments can often be a daunting task, given the need to adhere to specific conventions and standards. In this context, Gen AI can be utilized to offer language assistance, ranging from editing and proofreading to helping students generate more formal and professional-sounding prose.

3. OPPORTUNITIES AND CHALLENGES OF USING GENERATIVE AI IN COMMERCE EDUCATION

OPPORTUNITIES:

- **Enhanced Student Engagement:** Gen AI tools can be utilized to increase student engagement, particularly in disciplines such as taxation, law, and auditing, which often involve a significant emphasis on procedural knowledge. By utilizing chat-based interfaces, Gen AI can help make complex subjects more accessible and engaging, thus encouraging deeper learning.
- **Development of AI Literacy as an Employability Skill:** With the increasing adoption of AI in businesses worldwide, proficiency in utilizing these tools has become a valuable skill, with employers seeking individuals who are comfortable interacting with AI systems. As such, familiarity with AI tools can be leveraged as a means of enhancing employability, especially among students, who can utilize these tools to gain a competitive advantage in the job market. By encouraging students to develop AI literacy, educators can help equip them with skills that extend beyond their specialisation and facilitate their success in the modern workplace.
- **Adoption of Flipped and Blended Classrooms:** Many educators have adopted flipped and blended classrooms, wherein students engage with new material outside of class, usually in the form of videos or readings, and then apply their knowledge through activities and discussions during class time. This approach can be supplemented by the use of Gen AI tools, wherein students can interact with the material outside of class and then engage in more

interactive and discussion-based sessions during class, thus promoting deeper learning and critical thinking.

- **Addressing Differentiated Learning Needs:** Students have diverse learning needs and preferences, and some may find it more challenging to grasp certain concepts than others. Additionally, some students, particularly those whose first language is not English, may struggle with language barriers. Gen AI can be utilized to address these differentiated needs by providing additional support, such as explaining concepts in greater detail, providing language assistance, or breaking down complex subjects into more manageable components, thus facilitating equitable learning opportunities for all students.
- **Reduced Administrative Workloads for Educators:** Many educators have reported that administrative duties can often be time-consuming and detract from their ability to focus on teaching and research. By utilizing Gen AI tools to automate certain tasks, such as grading multiple-choice assessments or generating question banks, educators can save time and effort, thereby allowing them to dedicate more time and energy to their teaching and research activities.

CHALLENGES

- **Academic Integrity Concerns:** Gen AI tools have the potential to facilitate academic dishonesty, particularly in disciplines that place a strong emphasis on research and essay writing, such as commerce education. By simply inputting prompts, students can generate essays, case analyses, and even research reports, which they can then submit as their own work, thus undermining the integrity of the assessment process. As such, it is crucial for educators to implement measures to prevent and detect academic misconduct, such as plagiarism detection tools and strict honour codes.
- **Erosion of Core Analytical and Judgement Skills:** In disciplines such as accounting, financial analysis, and auditing, analytical and judgement skills are integral to professional practice. However, the reliance on Gen AI tools to generate responses and solutions may hinder the development of these skills, as students may become overly reliant on the tools rather than engaging in critical thinking and independent analysis. This presents a significant concern, particularly in fields that require strong analytical and judgement skills.
- **Accuracy and Reliability Concerns:** One of the main limitations of Gen AI tools is their potential to provide inaccurate information, particularly in subjects such as business law and taxation, where statutes and regulations are subject to frequent amendments. This can result in students receiving incorrect information, which can compromise their learning and decision-making. As such, it is important for educators to emphasize the importance of verifying the information provided by these tools and encouraging students to consult reliable sources.
- **Data Privacy and Ethical Considerations:** The widespread use of Gen AI tools raises important data privacy and ethical concerns, particularly in relation to the collection and use of student data. By utilizing these tools, students and educators may inadvertently share sensitive information with third parties, which can raise privacy and security concerns. Additionally, ethical considerations should be taken into account when utilizing Gen AI tools,

such as ensuring that these tools are used responsibly and ethically, and that students are aware of the potential limitations and risks associated with these tools.

- **Digital and Economic Divide:** Access to Gen AI tools may be limited among certain students, particularly those from low-income households or institutions that lack the necessary resources to adopt these technologies. This can create a digital and economic divide, wherein students from disadvantaged backgrounds may be unable to access the same educational opportunities as their peers, thus exacerbating existing inequalities in education.
- **Faculty Readiness and Training:** Many faculty members who teach commerce-related disciplines may lack the necessary skills and confidence to effectively integrate Gen AI tools into their teaching practices. This may discourage them from adopting these tools or using them inappropriately, thus undermining their potential benefits. As such, it is important for institutions to invest in faculty training and professional development to ensure that educators are equipped with the necessary skills to leverage these tools in their teaching practices.

4. PROPOSED FRAMEWORK FOR RESPONSIBLE ADOPTION OF GEN AI IN COMMERCE EDUCATION

Based on the opportunities and challenges presented by Gen AI in commerce education, this paper proposes the following framework for responsible adoption of these tools:

- **Curriculum redesign:** To fully integrate Gen AI into commerce education, it will be necessary to revise the curriculum to reflect the latest developments in this field. One way of achieving this objective is by incorporating 'AI literacy' into the curriculum or offering modules that encourage students to critically evaluate the information provided by these tools. This is important, given the potential for these tools to provide inaccurate information, particularly in subjects such as business law and taxation.
- **Assessment redesign:** Institutions should consider redesigning their assessment strategies to promote authentic assessment while also deterring the use of Gen AI tools for academic dishonesty. For instance, educators could consider adopting alternative assessment methods such as presentations and oral examinations to supplement written assessments. Additionally, assessments should be designed to encourage higher-order cognitive skills such as judgement and reasoning, thus ensuring that students are not solely reliant on AI tools to complete their assignments.

- **Faculty development:** Faculty members need to be trained on the effective use of Gen AI tools in education. By offering workshops and training sessions, institutions can empower educators to confidently utilise these tools in their teaching practices while also addressing their concerns and misconceptions about these technologies.
- **Ethical guidelines:** Institutions should develop ethical guidelines in relation to the use of Gen AI in education, and these guidelines should be disseminated to all stakeholders, including students and faculty members. These guidelines should provide practical recommendations on the ethical use of these tools while also addressing concerns related to data privacy and security.

5. RECOMMENDATIONS

Based on the preceding analysis, it is therefore important for educators to adopt a balanced perspective in relation to these tools, whereby they encourage their judicious use while also being aware of their limitations. In this context, this paper offers the following recommendations for achieving responsible adoption of Gen AI in commerce education.

First, educators should consider using these tools to support students' knowledge and procedural recall, while reserving higher-order skills for human judgement and instruction. As noted throughout this paper, Gen AI can be used to support various aspects of commerce education, ranging from providing explanations of concepts to generating practice questions and even completing assignments. Given that most disciplines within commerce education place a strong emphasis on judgement and analytical skills, it is important that these skills are cultivated through human instruction, rather than relying on Gen AI tools. For instance, in accounting, financial analysis, auditing, and tax planning, judgement plays a critical role in practice, and students need to develop these skills through human instruction, rather than relying on these tools to do it for them. This is not to suggest that these tools should not be used in these disciplines, but rather that they should be used judiciously to support knowledge and procedural recall, rather than supplanting the need for human judgement. Second, it will be important for institutions to invest in faculty development to ensure that they have the requisite skills and confidence to adopt these tools in a responsible manner. As noted in this paper, many faculty members who teach commerce-related disciplines are not familiar with AI tools, and this lack of familiarity may deter them from using these tools or using them irresponsibly. Finally, faculty members need to encourage students to utilise these tools in a responsible manner by educating them on their potential benefits and limitations. This includes encouraging students to use these tools to support their learning while also emphasizing the importance of verifying the accuracy of the information provided by these tools, particularly in disciplines such as business law and taxation, where accuracy is paramount.

8. CONCLUSION

Generative artificial intelligence represents a disruptive innovation that has the potential to revolutionize commerce education. While there are concerns about the potential of these tools to compromise academic integrity, judicious use of these tools can enhance the learning experiences of students while also preparing them for the modern workplace. By redesigning the curriculum and assessments while also providing faculty with the necessary support, educators can harness the potential of these tools to enhance commerce education.

AI AND ENGLISH: SHAPING FUTURE-READY TEACHERS

Mrs. Deepu R
Research Scholar, Department of Education, Kuvempu University, Shankaraghatta, Shivamogga Dist. E-mail Id: deepukreis@gmail.com
Dr. C. Geetha
Professor & Chairman, Department of Education, Kuvempu University, Shankaraghatta, Shivamogga Dist. E-mail Id: geetha.edu@gmail.com

Abstract

Artificial Intelligence (AI) is rapidly transforming the landscape of education, particularly the teaching and learning of languages. English, as a widely used global language, offers significant opportunities for AI-assisted learning through intelligent tutoring systems, generative AI, speech recognition, automated feedback, adaptive learning platforms and conversational tools. These technologies can support learners in developing the four language skills—Listening, Speaking, Reading and Writing (LSRW)—while providing personalised learning experiences and immediate feedback. At the same time, AI is redefining the role of the English teacher. The teacher of the future is not merely a transmitter of linguistic knowledge but a facilitator, mentor, designer of learning experiences and critical user of AI. This thematic paper explores the potential of AI to enhance English Language Proficiency (ELP), its applications in English Language Learning (ELL), and the competencies teachers need to integrate AI meaningfully into pedagogy. It also examines challenges related to accuracy, academic integrity, privacy, bias, digital inequality and overdependence on technology. The paper argues that AI should augment, rather than replace, the human teacher. A future-ready English teacher is therefore one who combines linguistic expertise, pedagogical knowledge, digital competence, AI literacy and human values to create meaningful and inclusive languagelearning experiences.

Keywords: *Artificial Intelligence, English Language Learning, English Language Proficiency, Future-Ready Teachers, AI Literacy, LSRW Skills, Language Education*

INTRODUCTION:

The emergence of Artificial Intelligence has brought a significant transformation in the way knowledge is created, accessed, communicated and evaluated. Education is increasingly moving from conventional teacher-centred approaches towards technology-supported, personalised and learner-centred environments. Among the various educational domains influenced by AI, English Language Teaching and Learning has enormous potential for transformation. English learners traditionally depend on teachers, textbooks, language laboratories and peer interaction to develop proficiency. AI now offers additional possibilities: learners can converse with AI systems, receive instant writing feedback, practise pronunciation, generate reading materials at their level, expand their vocabulary, and obtain explanations of grammatical concepts. However, the increasing availability of AI does not diminish the importance of teachers. Rather, it changes their responsibilities. The future English teacher needs to know not only how to teach English but also how to use AI critically, creatively, ethically and pedagogically.

Thus, the central question is no longer:
"Can AI teach English?" but rather:
"How can English teachers harness AI to make language learning more meaningful, personalised, inclusive and effective?"

✞ ***AI in English Language Education***

Artificial Intelligence broadly refers to computational systems capable of performing tasks associated with human Intelligence, such as understanding language, generating content, recognising speech, identifying patterns, and providing recommendations.
In English education, AI can function as:

- a learning assistant
- a conversation partner
- a writing coach
- a pronunciation facilitator
- a vocabulary tutor
- a grammar support system
- an assessment assistant
- a content-generation tool
- a personalised learning companion

Generative AI has further expanded these possibilities by enabling teachers and learners to interact with AI through natural language.
The educational value of AI, however, does not lie simply in using sophisticated technology. Its real value emerges when it is purposefully integrated with sound language pedagogy.

✞ ***AI and English Language Proficiency***

English Language Proficiency involves the ability to use English effectively and appropriately in different contexts. AI can support the development of proficiency across the major language skills.

Role of AI in Developing English Language Skills

Language Skill	AI-Supported Activities	Potential Benefits to Learners	Role of the Teacher / Key Consideration
Listening	• Audio materials at different proficiency levels • Conversations with varied accents • Transcripts and captions • Comprehension questions • Repeated listening • Explanations of unfamiliar expressions	• Develops listening comprehension • Provides exposure to diverse accents • Enables self-paced and repeated practice • Extends learning beyond classroom time	The teacher selects appropriate materials and verifies their accuracy. AI can provide additional practice but should complement classroom interaction.

Speaking	• Simulated conversations Everyday communication practice • Interview rehearsal	• Builds speaking confidence • Provides lowpressure practice • Improves fluency and pronunciation • Encourages repeated	Teacher facilitates authentic human communication. AI should **supplement, not replace, human interaction**, which develops empathy, spontaneity, body language and social skills.
Language Skill	**AI-Supported Activities**	**Potential Benefits to Learners**	**Role of the Teacher / Key Consideration**
	• Role-play activities • Pronunciation practice • Feedback on language use	communication practice	
Reading	• Level-appropriate texts • Vocabulary explanations • Summaries • Comprehension questions • Contextual definitions • Text simplification • Personalised reading materials	• Supports different proficiency levels • Enhances vocabulary development • Improves comprehension • Enables personalised and differentiated learning	Teacher can use AI to create different versions of texts while maintaining common learning objectives and should evaluate the quality of AI-generated content.
Writing	• Grammar checking • Vocabulary suggestions • Sentence-level feedback • Coherence and structure support • Spelling and punctuation correction • Drafting and revision assistance	• Improves accuracy and organisation • Encourages selfediting and revision • Provides immediate feedback • Develops independent writing skills	Teacher should encourage **revision rather than direct AIgenerated answers**. AI should function as a **writing mentor, not a writing substitute**.

Source: *Author's synthesis based on the reviewed literature on Artificial Intelligence in English Language Learning.*

AI for Vocabulary and Grammar Learning

Vocabulary acquisition requires repeated exposure, contextual use and active retrieval. AI can generate personalised vocabulary exercises based on learners' needs.

For example, AI can create:

- contextual sentences
- synonyms and antonyms
- word-association activities

- vocabulary quizzes
- cloze exercises
- flashcard material
- situation-based dialogues

Similarly, grammar learning can move beyond mechanical exercises. Teachers can ask AI to generate contextual examples of grammatical structures and create differentiated practice activities.

Instead of merely teaching:

→ "The Present Perfect Tense"

→ a teacher can design an AI-supported communicative task such as:

→ "Ask the learner five questions about experiences they have had in their life and encourage them to respond using the present perfect."

→ Thus, AI can help shift grammar instruction from rule memorisation to meaningful language use.

→ AI and LSRW Skills: A New Possibility

→ The four language skills can be strengthened through an integrated AI-supported approach.

AI Support for English Language Skills

English Language Skill	**Possible AI Support**
Listening	Audio generation, transcripts, comprehension activities
Speaking	AI conversations, role-play, pronunciation practice
Reading	Adaptive texts, summaries, vocabulary support
Writing	Feedback, editing, drafting and revision support

Possible AI Support for English Language Skills

English Language Skill	**Possible AI Support**
Listening	Audio generation, transcripts, comprehension activities
Speaking	AI conversations, role-play, pronunciation practice
English Language Skill	**Possible AI Support**
Reading	Adaptive texts, summaries, vocabulary support
Writing	Feedback, editing, drafting and revision support

The teacher's role is to connect these technologies to authentic communicative situations.

For instance, students may:

Listen → Discuss → Read → Write around a common theme.

AI can support each stage while the teacher remains responsible for designing the learning experience and evaluating meaningful learning.

✞ ***From Teacher to AI-Augmented Teacher***

AI does not necessarily make teachers less important. Instead, it can make certain traditional teacher roles less dominant while creating new responsibilities.

Traditional teacher

Teacher → Content → Student

AI-augmented teacher

Teacher + AI → Learning Experience → Student

The future-ready teacher may function as:

- Facilitator – guiding learners rather than simply delivering information.
- Learning Designer – creating meaningful AI-supported activities.
- Language Mentor – supporting communication and language development.
- AI Curator – selecting appropriate AI tools and resources.
- Critical Evaluator – checking AI-generated information and language.
- Ethical Guide – teaching responsible use of AI.
- Human Connector – preserving empathy, collaboration and authentic communication.

Therefore, AI should not be viewed as a competitor to teachers but as a pedagogical partner.

❖ ***Essential Competencies of a Future-Ready English Teacher***

The English teacher of the future requires a combination of competencies.

Linguistic Competence

- Pedagogical Competence
- AI Literacy
- Digital Competence
- Critical Thinking
- Ethical Competence

✞ ***AI as a Tool for Personalised English Learning***

- One of the greatest possibilities of AI is personalisation.
- A classroom may contain learners with very different levels of English proficiency. A single textbook and identical activity may not meet everyone's needs.
- AI can help teachers create differentiated materials for:
- beginners
- intermediate learners
- advanced learners
- learners requiring additional support
- For example, the same topic— "Environmental Pollution"—could be presented as:
- a simple paragraph for beginners,
- a newspaper-style article for intermediate learners,
- an argumentative text for advanced learners.

Thus, AI can help teachers move towards "one classroom, multiple learning pathways."

✞ ***AI and Assessment of English***

AI can assist teachers in formative assessment by providing rapid feedback on student work.

Possible applications include:

- grammar analysis
- vocabulary assessment
- writing feedback
- reading comprehension
- pronunciation support
- personalised practice questions

However, AI-based assessment should not be treated as automatically reliable.

The teacher must remain the final educational decision-maker, particularly when assessment

involves complex abilities such as creativity, critical thinking, communication and contextual language use.

✞ ***AI and Inclusive English Education***

AI also has the potential to make English learning more accessible.

Learners can potentially benefit from:

- text-to-speech tools
- speech-to-text systems
- translation support
- simplified texts
- multimodal resources
- personalised explanations
- repeated practice without embarrassment

This may be particularly useful in multilingual educational contexts such as India, where learners enter English classrooms with diverse linguistic backgrounds and varying levels of proficiency.

AI can therefore contribute to a more flexible and learner-responsive English classroom—provided access to technology is equitable.

CHALLENGES AND CONCERNS

The integration of AI into English education also presents significant challenges.

- Accuracy
- Overdependence
- Academic Integrity
- Bias
- Privacy
- Digital Inequality
- Human Interaction

THE INDIAN CONTEXT

India presents a particularly interesting context for AI-supported English education. English is an important language in higher education, employment, science, technology, and global communication.

At the same time, Indian classrooms are linguistically diverse. Learners may have different mother tongues and varying degrees of exposure to English.

AI can support this context through:

- multilingual explanations
- personalised English practice
- conversational English activities
- pronunciation practice
- differentiated learning materials
- teacher-assisted content creation

However, technology should be implemented with attention to accessibility, affordability, linguistic diversity and digital literacy.

The objective should not be to replace India's rich multilingual ecosystem with English-only

technology. Instead, AI can be used to create bridges between learners' existing linguistic resources and English proficiency.

✞ **A *Suggested* Framework: SMART English Teacher**

A useful conceptual framework for the future-ready English teacher can be represented through the word SMART:

S – Subject and Language Expertise

Strong knowledge of English and language pedagogy.

M – Meaningful AI Integration

Using AI where it genuinely improves learning.

A – AI and Digital Literacy

Understanding AI tools, capabilities and limitations.

R – Reflective and Responsible Practice

Evaluating AI critically and ethically.

T – Teacher–Learner Connection

Preserving empathy, communication, collaboration and human relationships.

Thus:

SMART Teacher = Language Expertise + Pedagogy + AI Literacy + Ethics + Human Connection

Towards a Human-Centred AI Classroom

The goal of AI integration should not be to create a classroom dominated by machines. The goal should be to create a classroom in which technology enhances human potential.

A human-centred AI English classroom may follow this principle:

AI generates → Teacher evaluates → Learner explores → Learner creates → Teacher guides → Learner reflects

This cycle places the learner and teacher—not the technology—at the centre of education.

The most valuable outcome of AI-supported English education is therefore not simply faster completion of assignments. It is the development of learners who can:

- communicate confidently,
- think critically,
- use English effectively,
- evaluate information,
- collaborate with others,
- Moreover, use AI responsibly.

IMPLICATIONS FOR TEACHER EDUCATION

→ Teacher education institutions have an important responsibility in preparing futureready English teachers.

→ Teacher education programmes should provide opportunities for prospective teachers to:

→ Explore AI tools relevant to English education.

→ Design AI-supported English lessons.

→ Develop effective prompting skills.

→ Evaluate AI-generated language materials.

→ Understand AI ethics and academic integrity.

→ Develop AI-assisted assessment strategies.
→ Practise differentiated instruction using AI.
→ Reflect critically on the limitations of AI.
→ Learn to balance AI interaction with human interaction.
→ Develop lifelong learning habits in a rapidly changing technological environment.
→ AI literacy should therefore become an integral component of contemporary teacher professional development.

CONCLUSION:

- Artificial Intelligence is not simply another educational technology. It is transforming the nature of teaching, learning and knowledge itself. In English education, AI can provide unprecedented opportunities for personalised learning, continuous practice, instant feedback and multimodal language development.
- However, technology alone cannot produce proficient English users. Pedagogy, human interaction, motivation, empathy and meaningful communication remain essential.
- The future-ready English teacher will therefore not be the one who knows the most AI tools. Rather, it will be the teacher who knows which tool to use, when to use it, why to use it, how to evaluate its output and when not to use it.
- AI should augment the teacher, not replace the teacher; empower the learner, not replace the learner's thinking.
- The future of English language education lies not in choosing between AI and teachers, but in creating a meaningful partnership between Artificial Intelligence and human Intelligence.

Ultimately:

Smart AI + Smart Teachers + Smart Pedagogy = Future-Ready English Learners

Moreover, the real measure of success will not be how intelligent our machines become, but how intelligently teachers use them to help learners communicate, think and learn better in English.

AI-ENABLED TEACHER EDUCATION: TRANSFORMING PRE-SERVICE TEACHERS INTO SMART AND FUTURE-READY EDUCATORS

Dr. Kiran Kumar K.S.
Assistant Professor, Kumadvathi College of Education, Shikaripura-577427.
Email: kirankumbar.ks25@gmail.com

Abstract

Artificial Intelligence (AI) is rapidly transforming education by influencing teaching, learning, assessment, curriculum design, educational administration, and professional development. This transformation has significant implications for teacher education because pre-service teachers are the future mediators between technology, learners, knowledge, and society. The purpose of this conceptual paper is to examine how AI-enabled teacher education can transform pre-service teachers into smart and future-ready educators. The paper explores the changing role of teachers in an AI-mediated educational environment, the competencies required by pre-service teachers, pedagogical applications of AI, opportunities for personalized and inclusive learning, assessment and feedback, professional development, and the ethical challenges associated with AI use. The discussion is informed by contemporary international frameworks, particularly UNESCO's AI Competency Framework for Teachers, which emphasizes a human-centred mindset, ethics of AI, AI foundations and applications, AI pedagogy, and AI for professional learning. Recent research also indicates that scholarship on AI in pre-service teacher education is expanding rapidly, with increasing attention moving from technological efficiency toward the development of AI-literate and pedagogically competent teachers. The paper argues that AI should not be viewed as a replacement for teachers but as a powerful partner that can augment teachers' professional capacities. Teacher education institutions therefore need to move beyond basic digital literacy and develop AI literacy, critical thinking, ethical reasoning, prompt and information literacy, data literacy, pedagogical decision-making, and reflective professional practice. The paper proposes a human-centred, competency-based and practice-oriented approach to AI-enabled teacher education. Such an approach can prepare pre-service teachers to use AI responsibly, creatively, inclusively and critically while preserving the human purposes of education.

Keywords: *Artificial Intelligence, AI-enabled teacher education, pre-service teachers, AI literacy, smart teachers, future-ready educators, teacher competencies, generative AI, digital pedagogy, ethical AI*

Introduction

Artificial Intelligence has moved from being a specialised technological innovation to becoming an increasingly influential component of contemporary educational ecosystems. AI-supported applications are now being used for content generation, lesson planning, tutoring, assessment, feedback, learning analytics, language support, adaptive learning and professional development. The growing accessibility of generative AI has further accelerated this transformation. Consequently, education systems are being required to reconsider not only how students learn but also what teachers need to know, do and value.

The emergence of AI creates a particularly important challenge for teacher education. Pre-service teachers are being prepared for classrooms in which learners may have access to AI

tools before they fully understand their benefits, limitations and risks. Therefore, teacher education cannot remain focused exclusively on conventional pedagogical knowledge and general digital skills. It must prepare teachers to critically understand and pedagogically integrate AI. UNESCO's AI Competency Framework for Teachers (2024) recognizes that AI is changing the traditional teacher-student relationship into a teacher-AI-student relationship and identifies 15 competencies across five dimensions: human-centred mindset, ethics of AI, AI foundations and applications, AI pedagogy, and AI for professional learning. The framework proposes progressive levels of competence—Acquire, Deepen and Create. Recent research specifically examining pre-service teacher education also indicates that AI research has expanded substantially, particularly following the emergence of generative AI. A 2026 systematic review of 229 publications identified three major research hotspots: core AI technologies, pedagogically oriented AI applications for competency development, and generative AI integration. Importantly, the research emphasis is increasingly shifting from merely improving teaching efficiency toward developing AI-literate educators. Thus, the central question is no longer whether AI will influence teacher education, but how teacher education institutions can prepare teachers to use AI intelligently, ethically and pedagogically.

AI and the Changing Role of the Teacher

The traditional image of the teacher as the primary source and transmitter of knowledge is being challenged by the availability of AI-powered information and learning resources. However, this does not imply that teachers are becoming less important. Instead, their professional role is becoming more complex.

In an AI-enabled classroom, teachers may increasingly function as:

1. **Learning designers** who create meaningful learning experiences.
2. **AI curators** who select appropriate and trustworthy AI tools.
3. **Learning facilitators** who guide students in using AI critically.
4. **Ethical decision-makers** who protect privacy, dignity, equity and academic integrity.
5. **Mentors and human supporters** who address emotional, social and developmental needs.
6. **Assessors** who evaluate learning beyond AI-generated outputs.
7. **Reflective practitioners** who examine the consequences of AI-supported teaching.
8. **Lifelong learners** who continuously update their AI-related knowledge and competencies.

The OECD argues that rapidly evolving AI and robotics require education systems to reassess the knowledge, skills and attitudes needed for future life and work. Similarly, the OECD Teaching Compass emphasizes teachers as agents of curriculum change, adaptive experts and co-designers of learning rather than passive implementers of externally determined innovations. Therefore, the future-ready teacher should not compete with AI in areas where machines are efficient. Instead, teachers should develop distinctly human capabilities such as empathy, judgement, creativity, ethical reasoning, communication, collaboration and contextual decision-making.

Why AI-Enabled Teacher Education is Necessary

Teacher education institutions traditionally develop pedagogical knowledge, subject

knowledge, classroom management skills and professional attitudes. In the AI era, these remain essential but need to be complemented by AI-related competencies.

AI-enabled teacher education is necessary for several reasons.

- **Preparing teachers for AI-mediated classrooms:** Pre-service teachers will enter classrooms where AI-based technologies are increasingly available. They therefore need opportunities to understand how AI works, what it can and cannot do, and how it can influence learners.
- **Developing AI literacy:** AI literacy involves more than knowing how to operate an AI application. Teachers should understand basic AI concepts, data, algorithms, generative systems, limitations, bias, reliability and responsible use.
- **Strengthening pedagogical decision-making:** The availability of an AI tool does not automatically make its use educationally appropriate. Pre-service teachers should learn to ask: *What is the learning objective? Why should AI be used? What value does it add? What risks does it create? What human interaction should remain central?*
- **Promoting lifelong professional learning:** AI is developing rapidly. Consequently, teachers cannot depend on one-time training. Teacher education should cultivate a culture of continuous experimentation, reflection, professional collaboration and lifelong learning.

A recent scoping review of 55 studies on AI for pre-service teacher development found a diverse range of AI applications and highlighted the growing significance of AI in teacher professional development.

Core AI Competencies for Pre-Service Teachers

An effective AI-enabled teacher education programme should develop a multidimensional competency framework.

- **Human-centred mind-set:** AI should serve educational and human purposes rather than determine them. Pre-service teachers need to understand human agency, dignity, social responsibility and the developmental needs of learners.
- **AI foundations and applications:** Teachers need foundational knowledge about AI systems, machine learning, generative AI, natural language processing, recommendation systems and learning analytics. They do not necessarily need to become programmers, but they should possess sufficient conceptual knowledge to make informed professional decisions.
- **AI pedagogical competence:** AI literacy becomes meaningful only when connected to pedagogy. Pre-service teachers should learn how AI can support inquiry-based learning, project-based learning, collaborative learning, differentiated instruction, creativity and problem-solving.

  UNESCO specifically identifies AI-enhanced pedagogical innovation as a competency involving critical assessment of AI's impact on teaching, learning and assessment and the design of AI-supported learning scenarios.
- **Ethical and responsible AI competence:** Teachers must understand issues such as privacy, data protection, algorithmic bias, misinformation, intellectual property, copyright, academic integrity and unequal access.

- **AI-supported professional learning:** AI can assist teachers in preparing lesson plans, generating examples, developing classroom activities, analysing feedback, creating differentiated resources and reflecting on teaching practices. However, professional judgement must remain with the teacher.
- **Critical AI literacy:** Perhaps the most important competency is the ability to question AI-generated information. Pre-service teachers should learn to verify claims, identify hallucinations, compare sources, detect bias and distinguish plausible information from reliable evidence.

AI-Enabled Pedagogical Applications in Teacher Education

Teacher education programmes can integrate AI through authentic pedagogical experiences rather than treating AI as a separate theoretical subject.

- **AI-assisted lesson planning:** Pre-service teachers can use AI to generate alternative lesson structures, learning activities, examples and differentiation strategies. Teacher educators can then require student teachers to critique and improve the AI-generated lesson rather than simply accept it.
- **Microteaching and simulation:** AI-supported simulations can expose pre-service teachers to diverse classroom situations. They can practise questioning, classroom management, differentiated instruction and feedback before entering real classrooms.
- **Personalized learning:** AI can support the creation of learning resources at different levels of complexity. This can help teachers address learner diversity, although personalization must not become automated labelling or profiling of students.
- **Assessment and feedback:** AI can assist in generating rubrics, formative questions and preliminary feedback. However, final assessment decisions should involve professional teacher judgement, particularly when evaluating creativity, reasoning, values and socio-emotional development.
- **Inclusive education:** AI can support translation, speech-to-text, text-to-speech, accessible learning materials and differentiated content. Such applications can potentially reduce barriers for learners with diverse linguistic and learning needs.
- **Reflective practice:** Pre-service teachers can use AI as a reflective dialogue partner by asking it to identify alternative interpretations of a classroom situation. The teacher trainee can then compare these suggestions with observation, evidence and professional knowledge.

Generative AI and the Development of Smart Teachers

Generative AI has introduced a new dimension to teacher education because it can produce text, images, questions, explanations, lesson plans and other educational materials. However, generating an output is not equivalent to producing educational value.

The OECD's Digital Education Outlook 2026 emphasizes that generative AI can support learning when guided by clear pedagogical principles, while unguided use can improve task performance without necessarily producing genuine learning gains.

Therefore, pre-service teachers should learn a **"critique–adapt–apply–reflect"** cycle:

- **Critique:** Examine the accuracy, relevance, bias and limitations of AI output.

- **Adapt:** Modify the output according to curriculum, learner characteristics and educational objectives.
- **Apply:** Use the adapted material in an appropriate pedagogical context.
- **Reflect:** Evaluate whether AI actually improved learning and what should be changed next time.

This approach transforms pre-service teachers from passive consumers of AI-generated content into thoughtful educational designers.

Ethical Challenges

AI-enabled teacher education also presents serious ethical challenges.

- **Academic integrity:** Students may submit AI-generated assignments as their own work. Teacher educators therefore need assessment strategies that emphasize process, oral defence, reflection, classroom performance and authentic tasks.
- **Privacy and data protection:** Educational AI systems may process learner information. Pre-service teachers must understand the importance of protecting personal and sensitive data.
- **Bias and discrimination:** AI systems can reproduce biases present in training data. Teachers must therefore avoid treating AI recommendations as neutral or objective.
- **Digital inequality:** Not every student or institution has equal access to devices, connectivity or premium AI tools. AI-enabled teacher education must therefore address the digital divide rather than deepen it.
- **Overdependence on technology:** Excessive dependence on AI can weaken independent thinking, creativity and professional judgement. AI should augment human intelligence, not replace it.

  UNESCO's approach is explicitly human-centred and emphasizes human agency, accountability, ethics and sustainability.

A Proposed Model for AI-Enabled Teacher Education

A practical model can be organised around five interconnected stages:

Stage 1 – Awareness: Introduce AI concepts, opportunities, limitations and social implications.

Stage 2 – Acquisition: Develop foundational AI literacy, digital skills, prompt literacy, information literacy and ethical awareness.

Stage 3 – Pedagogical Integration: Enable pre-service teachers to apply AI to lesson planning, teaching, assessment, inclusion and classroom problem-solving.

Stage 4 – Critical Reflection: Require teachers to evaluate AI outputs, identify risks, compare alternatives and justify their professional decisions.

Stage 5 – Innovation and Leadership: Prepare teachers to design new AI-supported learning experiences, collaborate with colleagues and contribute to institutional AI policies.

This progression is compatible with UNESCO's Acquire–Deepen–Create approach to teacher AI competencies.

Implications for Teacher Education Institutions

Teacher education institutions need systemic rather than superficial changes. First, AI literacy should be embedded across the curriculum rather than confined to one isolated technology

course. Second, teacher educators themselves require continuous professional development because they are responsible for modelling responsible AI practice. Third, institutions should develop clear policies regarding academic integrity, privacy, assessment and acceptable AI use.

Teaching practice should also become a laboratory for responsible AI experimentation. Pre-service teachers can document how they use AI during lesson planning, implement AI-supported activities during internships and critically evaluate the outcomes.

Institutions should also promote collaborative learning communities in which teacher educators and pre-service teachers share successful practices, failures and ethical dilemmas.

10. Conclusion

Artificial Intelligence is not simply another educational technology; it is a transformative force that is redefining what teachers need to know and how they perform their professional roles. Teacher education therefore stands at a critical point of transition. Preparing pre-service teachers for an AI-enabled future requires more than teaching them how to operate AI tools. It requires the development of AI literacy, pedagogical competence, critical thinking, ethical reasoning, data awareness, creativity and professional judgement.

The future-ready teacher should be neither an opponent of AI nor an unquestioning user of it. The teacher should be a critical, ethical and creative human professional who knows when, why and how AI should be used.

AI can automate certain tasks, generate resources, analyse information and provide rapid feedback, but it cannot replace the relational, moral and contextual dimensions of teaching. The ultimate objective of AI-enabled teacher education should therefore be to strengthen—not diminish—human agency.

Teacher education institutions must consequently move from technology adoption to competency development, from tool training to pedagogical integration, and from AI dependence to responsible human-AI collaboration. Such a transformation can produce smart teachers who are technologically capable, pedagogically innovative, ethically responsible and prepared to lead learning in an uncertain and rapidly changing future.

In this sense, the smart teacher of the future is not the teacher who knows the most AI tools. The smart teacher is the teacher who can combine artificial intelligence with human intelligence, professional wisdom and ethical responsibility to create meaningful learning.

Abstract

Artificial Intelligence (AI) is emerging as one of the most influential technologies transforming the educational landscape. Its applications in teaching and learning extend beyond automated assessment and personalized instruction to areas such as student engagement, motivation, emotional support, learning analytics, and wellbeing. In traditional classrooms, teachers often face difficulties in identifying individual learning needs, monitoring student participation, providing timely feedback, and responding to the diverse emotional and academic needs of students. Artificial Intelligence can assist teachers by analysing learning patterns, identifying students who may be disengaged, providing personalized learning experiences, and supporting timely interventions. At the same time, the use of AI in education raises important concerns relating to privacy, bias, digital inequality, overdependence on technology, academic integrity, and the possibility of reducing meaningful human interaction. Therefore, AI should not be viewed as a replacement for teachers but as a supportive technology that can strengthen teachers' capacity to understand and respond to students. UNESCO's AI Competency Framework for Teachers emphasizes that AI should be integrated through a human-centred approach, with teachers retaining responsibility for meaningful interaction and human flourishing in education. This paper explores the role of AI in enhancing student engagement and wellbeing, examines opportunities and challenges, discusses the changing role of teachers, and proposes strategies for responsible and inclusive AI integration. The paper argues that the future of education should not be merely technology-driven but human-centred, where smart technologies and smart teachers work together to create engaging, supportive, inclusive, and emotionally healthy learning environments.

Keywords: *Artificial Intelligence, Student Engagement, Student Wellbeing, Smart Teachers, Personalized Learning, Learning Analytics, Educational Technology, Human-Centred AI*

Introduction

Education is undergoing a significant transformation due to rapid developments in digital technologies and Artificial Intelligence. The traditional classroom, in which the teacher is the primary source of knowledge and students are largely passive recipients, is gradually changing into a more interactive, personalized, and technology-supported learning environment. Artificial Intelligence has become an important component of this transformation because it can process large amounts of information, recognize patterns, generate content, provide feedback, and support decision-making. In education, these capabilities create new possibilities for understanding students and designing learning experiences according to their

individual needs. The purpose of education, however, is not limited to academic achievement. Education also aims to develop confidence, curiosity, creativity, social skills, emotional resilience, critical thinking, and a sense of belonging. Therefore, student engagement and wellbeing are central to the educational process. A student who is academically capable but emotionally distressed, socially isolated, or disconnected from the classroom may not be able to achieve his or her full potential. Similarly, a student who is engaged only because of external pressure may not develop genuine interest in learning. Recent research indicates that student engagement has meaningful associations with both academic achievement and subjective wellbeing, demonstrating that these dimensions of student development are closely interconnected.

Artificial Intelligence can contribute to this area by enabling teachers to obtain richer information about students' learning behaviour. AI-powered learning platforms can analyse participation, assignment completion, assessment performance, interaction patterns, and learning progress. Such information may help teachers identify students who require additional academic support. AI can also provide personalized resources, adaptive activities, immediate feedback, and conversational assistance, potentially making learning more accessible and interactive.

At the same time, the introduction of AI into education must be approached carefully. Student data are sensitive, and educational institutions must ensure that information collected through AI systems is protected. UNESCO's guidance on generative AI in education emphasizes the importance of privacy protection, ethical safeguards, age-appropriate use, equity, and a human-centred approach.

Thus, the central issue is not whether AI should enter education, but how it should be used responsibly. The concept of the "smart teacher" should not mean a teacher who simply uses more technology. Rather, a smart teacher is one who combines professional knowledge, emotional intelligence, pedagogical expertise, ethical judgement, and appropriate use of AI to create better learning experiences for students.

Understanding Artificial Intelligence in Education

Artificial Intelligence refers broadly to computational systems capable of performing tasks that normally require aspects of human intelligence, such as learning from data, recognizing patterns, generating language, making predictions, and assisting decisionmaking. In education, AI can take several forms, including intelligent tutoring systems, adaptive learning platforms, automated feedback systems, educational chatbots, learning analytics, recommendation systems, speech and language technologies, and generative AI tools. The emergence of generative AI has further expanded the possibilities of educational technology. Generative AI can produce explanations, examples, questions, summaries, lesson materials, simulations, and other forms of educational content. When appropriately guided by teachers, such tools can provide students with additional opportunities for exploration and practice. They may also support teachers in preparing instructional materials and designing differentiated learning activities. However, AI-generated information is not automatically accurate, unbiased, or pedagogically appropriate. AI systems can produce incorrect information, reproduce biases present in training data, and provide responses that appear convincing despite being

inaccurate. Consequently, students must develop the ability to question, verify, analyse, and critically evaluate AI-generated information. Teachers therefore have an important role in teaching students not merely how to use AI but how to use it responsibly.

UNESCO's AI Competency Framework for Teachers describes AI competency as involving knowledge, skills, and values required for teachers to use AI appropriately. It places emphasis on a human-centred mindset, ethics, AI foundations and applications, AI pedagogy, and professional learning.

Concept of Student Engagement

Student engagement refers to the extent to which students actively participate in and connect with the learning process. It is a multidimensional concept that includes behavioural, emotional, and cognitive dimensions. Behavioural engagement involves participation, attendance, effort, and completion of learning activities. Emotional engagement relates to students' interest, enjoyment, belonging, and positive feelings toward learning. Cognitive engagement involves investment in understanding, critical thinking, problem-solving, and meaningful learning. Student engagement is essential because students learn more effectively when they are actively involved in the educational process. A disengaged student may attend a class physically but remain mentally disconnected from the learning activity. Therefore, engagement cannot be measured only by attendance or examination performance. AI can potentially help teachers understand different dimensions of engagement. For example, an AI-enabled learning platform may indicate that a student has stopped participating in online activities, is repeatedly submitting incomplete work, or is experiencing difficulty with particular concepts. Such information does not automatically prove that the student is disengaged, but it can provide an early signal for teacher attention.

The important point is that AI-generated indicators should support, rather than replace, teacher judgement. A student may fail to participate online because of poor internet connectivity, family responsibilities, illness, lack of confidence, or other circumstances. Therefore, the teacher must interpret the data within the broader social and educational context.

AI and Personalized Learning

One of the most significant contributions of AI to student engagement is personalized learning. Traditional classrooms often require teachers to teach a group of students who have different levels of knowledge, learning speeds, interests, and abilities. Providing individualized attention to every learner can be difficult, particularly in large classrooms.

AI-powered adaptive learning systems can modify learning content according to student performance. A student who has mastered a concept may receive more advanced activities, while a student experiencing difficulty may receive additional explanations and practice. This can reduce frustration and help students learn at an appropriate pace.

Personalization can also increase engagement because students may feel that learning activities are more relevant to their individual needs. When learners receive appropriate challenges rather than activities that are either too easy or too difficult, they may be more likely to participate actively.

However, personalization should not result in excessive automation. Students also need

opportunities to collaborate, communicate, debate, create, and learn from peers. Education is a social process, and technology should enhance rather than eliminate human interaction.

AI as a Tool for Increasing Classroom Engagement

AI can support teachers in designing interactive learning experiences. Teachers can use AI-assisted tools to develop quizzes, case studies, simulations, discussion questions, problem-solving activities, role-play scenarios, and differentiated assignments. These resources can make lessons more varied and can provide students with multiple ways of interacting with a subject. For example, a teacher teaching history may use AI to create different perspectives on a historical event and ask students to critically compare them. A science teacher may use AI to generate hypothetical situations for students to investigate. A language teacher may use conversational AI to provide additional opportunities for language practice. A commerce or management teacher may use AI-generated business cases to encourage decision-making and problem-solving.

Such applications can move students from passive reception of information toward active participation. The teacher's role becomes that of a facilitator who designs meaningful learning experiences and encourages students to question and analyse the information provided by AI.

AI and Immediate Feedback

Feedback is an essential component of effective learning. Students need to know what they have understood, where they have made mistakes, and how they can improve. In conventional classrooms, teachers may struggle to provide immediate individualized feedback to every student because of time and workload constraints.

AI systems can provide immediate feedback on certain types of learning activities. For example, language-learning platforms can identify grammatical errors, mathematical systems can identify incorrect steps, and adaptive platforms can recommend additional practice based on performance.

Immediate feedback can help students correct mistakes before they become persistent misconceptions. It can also encourage self-directed learning because students do not always need to wait for the next class to understand whether they are progressing.

Nevertheless, automated feedback should not replace teacher feedback in complex areas such as creativity, reasoning, values, communication, and personal development. Teacher feedback can provide context, encouragement, empathy, and professional judgement that automated systems cannot fully replicate.

Artificial Intelligence and Student Wellbeing

Student wellbeing refers to the physical, psychological, emotional, social, and educational conditions that enable students to function effectively and develop positively. Wellbeing is closely related to learning because students who experience excessive stress, anxiety, isolation, bullying, or lack of belonging may find it difficult to concentrate and participate effectively.

AI can potentially support student wellbeing by helping educators identify patterns that require attention. Learning analytics may indicate changes in attendance, participation, assignment completion, or academic performance. When combined with teacher observation and appropriate support systems, such information may help identify students who could

benefit from a conversation or additional assistance.

AI-based conversational systems may also provide students with basic informational or educational support outside regular classroom hours. For example, a student may use a learning assistant to clarify a concept, organize study activities, or receive guidance on available educational resources.

However, AI should not be considered a substitute for counsellors, teachers, parents, psychologists, or trusted adults. Emotional wellbeing requires human relationships, empathy, understanding, and professional intervention when necessary. UNESCO's human-centred approach is particularly important here because technology should support human flourishing rather than replace meaningful human interaction.

AI for Early Identification of Disengagement

One promising application of AI is the identification of students who may be at risk of disengagement. AI systems can examine patterns such as declining participation, repeated academic difficulties, irregular attendance, reduced interaction, or changes in learning activity.

Early identification can allow teachers to intervene before a problem becomes more serious. For example, if a student who previously participated actively begins submitting fewer assignments and performing poorly, the teacher may investigate the reasons. The appropriate response might be academic support, counselling, peer support, parental communication, or simply a personal conversation.

However, the use of predictive analytics raises serious ethical concerns. A prediction that a student is "at risk" should never become a permanent label. AI predictions can be wrong and may reflect biases in the data. Therefore, AI should be used as an early-warning support mechanism rather than as a system for making final judgements about students.

AI and Inclusion

AI has the potential to promote greater inclusion in education. Students with different learning needs can benefit from technologies such as speech recognition, text-to-speech systems, translation tools, adaptive learning applications, and personalized educational resources.

Students who have difficulty expressing themselves in traditional classroom settings may find alternative forms of interaction through digital tools. Language technologies can also support students who are learning in a language different from their home language.

AI can therefore contribute to educational accessibility when it is designed and implemented inclusively. However, digital inequality remains a major concern. Students from economically disadvantaged backgrounds may have limited access to devices, reliable internet connections, or high-quality digital resources. Consequently, AI integration should be accompanied by efforts to reduce the digital divide.

The Changing Role of the Teacher

The introduction of AI does not eliminate the importance of teachers. Instead, it changes the nature of teaching. UNESCO's AI Competency Framework explicitly emphasizes that teachers should remain central to meaningful interactions and human flourishing in education.

In an AI-supported classroom, teachers may increasingly function as learning designers, facilitators, mentors, ethical guides, evaluators, and relationship builders. They must decide

when AI is appropriate, which tools are reliable, how students should use them, and how learning outcomes should be assessed.

A smart teacher is therefore not simply a technologically skilled teacher. A smart teacher is one who understands both the possibilities and limitations of technology. Such a teacher knows when to use AI and, equally importantly, when not to use it.

Teachers also need to develop AI literacy. They should understand basic AI concepts, data privacy, algorithmic bias, responsible use, prompt design, verification of AI outputs, and the pedagogical implications of AI-assisted learning. Continuous professional development will be essential for this transition.

AI and Teacher Wellbeing

An important but sometimes overlooked aspect of AI in education is teacher wellbeing. Teachers frequently face heavy workloads related to lesson planning, assessment, documentation, administrative tasks, and individualized student support. AI may assist teachers with some routine activities, thereby allowing them to spend more time on meaningful interactions with students.

For example, AI can help generate initial lesson ideas, create question banks, organize information, provide draft feedback, or assist with administrative documentation. These applications may reduce repetitive work when used responsibly.

Reduced administrative workload can potentially allow teachers to focus more on mentoring, classroom interaction, creativity, and student wellbeing. However, AI can also create additional pressure if teachers are expected to adopt multiple technologies without sufficient training or institutional support. Therefore, technology should be introduced with professional development, adequate infrastructure, and realistic expectations.

AI and Emotional Engagement

Emotional engagement is an important part of learning. Students learn more effectively when they experience curiosity, interest, confidence, belonging, and a sense of achievement. AI can help teachers design learning experiences that are more relevant and interactive, but emotional engagement ultimately depends on human relationships.

Teachers play an irreplaceable role in encouraging students, recognizing their efforts, understanding their circumstances, and creating a supportive classroom climate. A sophisticated AI system may identify that a student's performance has declined, but the teacher is better positioned to ask the human question: "What is happening in this student's life?"

This distinction is crucial. AI can provide information about students, but teachers provide relationships with students. The future of education should therefore combine datainformed decision-making with empathy-informed teaching.

Challenges of Using AI for Student Engagement and Wellbeing

Despite its potential benefits, AI presents several challenges.

The first major concern is privacy. Educational AI systems may process sensitive student information, including academic records, behavioural data, and interaction patterns. Institutions must therefore establish clear policies regarding data collection, storage, access, and use.

The second concern is algorithmic bias. AI systems learn from data, and if the data

contain social or educational biases, AI recommendations may reproduce or reinforce those biases. This can have serious consequences for students from marginalized or disadvantaged backgrounds.

The third concern is overdependence. Excessive reliance on AI may reduce students' opportunities to think independently, solve problems, communicate with peers, and develop perseverance. If students use AI to complete every difficult task, they may obtain answers without developing the underlying knowledge and skills.

The fourth concern is the weakening of human interaction. Education is not merely the transmission of information. It involves relationships, values, social development, emotional support, and shared experiences. Excessive automation could weaken these dimensions.

The fifth concern is academic integrity. Generative AI can make it easier for students to produce assignments without genuinely engaging in the learning process. Therefore, teachers may need to redesign assessments to emphasize critical thinking, application, oral discussion, project work, reflection, and authentic performance.

Ethical Use of AI in Education

Responsible AI use requires clear ethical principles. Students should know when and how AI can be used for academic work. Teachers should verify AI-generated information before using it in teaching. Institutions should establish policies regarding privacy, academic integrity, accessibility, and responsible use.

Transparency is also important. Students should understand when AI is being used to support their learning and what types of information may be processed. AI should not make high-stakes decisions about students without meaningful human oversight.UNESCO's guidance emphasizes the need for safe, equitable, ethical, and meaningful use of generative AI in education, including attention to data privacy and appropriate governance.

The ethical principle can therefore be summarized as follows:

AI should assist educational decisions, not replace human responsibility for those decisions.

Building AI Literacy Among Students

If AI is becoming part of education, students need to learn how to use it responsibly. AI literacy should include understanding how AI systems work at a basic level, recognizing their limitations, evaluating the reliability of outputs, protecting personal information, identifying bias, and understanding ethical implications.

Students should be encouraged to use AI as a learning partner rather than as a shortcut. For example, instead of asking AI to write an entire assignment, a student could use AI to generate questions for discussion, receive alternative explanations, identify gaps in understanding, or obtain feedback on a draft.

Teachers should encourage students to ask questions such as: Is this information accurate? What evidence supports it? Could the AI be biased? What did I learn by using this tool? What part of this work reflects my own thinking?

Such practices can transform AI from a tool for answer generation into a tool for critical learning.

Strategies for Teachers to Use AI Effectively

Teachers should begin with educational objectives rather than technology. The first question should not be "Which AI tool should I use?" but "What learning problem am I trying to solve?" Once the objective is clear, the teacher can determine whether AI adds genuine value.

Teachers should also verify AI-generated content. Information generated by AI should be treated as a draft or resource requiring professional judgement rather than automatically accepted as fact.

Another important strategy is to maintain human interaction. AI can provide individualized practice, but classroom discussion, group activities, mentoring, and personal conversations should remain central. Teachers should also establish clear classroom rules for AI use. Students should know what forms of AI assistance are permitted, when disclosure is required, and which activities must be completed independently. Finally, teachers should continuously develop their AI competencies. UNESCO's framework highlights AI pedagogy and professional learning as important dimensions of teacher competency in the AI era.

Proposed Framework: Smart AI-Supported Education

A useful framework for enhancing student engagement and wellbeing through AI can be described through five interconnected components.

First, Understand: Teachers use AI-supported information to understand students' learning patterns, participation, interests, and areas of difficulty.

Second, Personalize: Learning activities are adapted according to individual needs, abilities, interests, and learning pace.

Third, Engage: AI is used to create interactive, collaborative, creative, and problembased learning experiences.

Fourth, Support: Students who demonstrate academic or behavioural difficulties receive timely human intervention and appropriate support.

Fifth, Humanize: Teachers ensure that technology strengthens relationships, empathy, inclusion, ethical development, and student wellbeing.

This framework emphasizes that the ultimate goal is not an "AI classroom" but a humancentred smart classroom.

Implications for Higher Education

The implications of AI are particularly significant in higher education. University students increasingly use AI for research, writing, coding, information gathering, language assistance, and academic support. Rather than relying solely on prohibition, higher education institutions need to develop responsible AI-use policies.

Assessment methods may need to change from assignments that can easily be generated by AI toward tasks requiring personal reflection, practical application, presentations, collaborative projects, research activities, and oral defence.

AI can also support university students through personalized academic advising, learning analytics, virtual assistants, and additional learning resources. Nevertheless, institutions should ensure that AI complements rather than replaces academic mentoring and student support services.

Implications for Indian Education

In the Indian context, AI presents both significant opportunities and challenges. India's education system serves students from highly diverse socio-economic, linguistic, cultural, and geographical backgrounds. AI could potentially support multilingual education, personalized learning, digital accessibility, teacher assistance, and large-scale educational resource development.

At the same time, differences in digital infrastructure and access must be considered. AI-based education cannot become an additional source of inequality. Rural and economically disadvantaged students should have equitable opportunities to access AIsupported learning.

Indian teachers therefore need appropriate professional development that combines technological skills with pedagogy and ethical awareness. AI should be introduced in ways that complement the country's educational objectives and preserve the importance of teachers, community, culture, and human values.

Major Findings

The discussion indicates that AI has considerable potential to enhance student engagement by providing personalized learning, immediate feedback, interactive content, adaptive activities, and learning support. AI can also assist teachers in identifying patterns that may indicate disengagement and can provide information that supports timely intervention.

The paper further indicates that AI can contribute to student wellbeing indirectly by reducing learning frustration, providing accessible support, enabling personalized learning, and helping teachers identify students who may need attention. However, AI should not be regarded as a replacement for professional counselling, teacher support, or meaningful interpersonal relationships.

Another major finding is that the effectiveness of AI depends substantially on teacher competence. Technology alone cannot create engagement or wellbeing. The teacher's ability to interpret information, build relationships, design meaningful learning experiences, and make ethical decisions remains fundamental.

Finally, the paper emphasizes that AI integration must be human-centred. Privacy, equity, transparency, bias, academic integrity, and student agency must be addressed if AI is to contribute positively to education.

Suggestions

Educational institutions should develop clear and practical policies for the responsible use of AI. These policies should address student privacy, academic integrity, ethical use, transparency, and acceptable applications of AI.

Teacher education and professional development programmes should include AI literacy and AI pedagogy. Teachers need opportunities to experiment with AI tools, understand their limitations, evaluate their educational value, and share successful practices. Institutions should also strengthen digital infrastructure and ensure that disadvantaged students are not excluded from AI-supported learning. Accessibility should be considered from the beginning rather than added later.

Assessment systems should be redesigned to encourage original thinking, creativity, critical analysis, reflection, collaboration, and practical application. AI should be integrated into

assessment literacy rather than treated solely as a threat to academic integrity.

Finally, schools and colleges should maintain strong counselling and student-support systems. AI can provide useful signals and resources, but human professionals should remain responsible for sensitive wellbeing issues.

Conclusion

Artificial Intelligence is reshaping education by changing the way teachers teach, students learn, and institutions understand educational processes. Its potential to enhance student engagement and wellbeing is significant because AI can support personalization, immediate feedback, adaptive learning, accessibility, learning analytics, and timely academic intervention. However, technology alone cannot create meaningful education. Student engagement depends on curiosity, motivation, belonging, interaction, and purposeful learning. Student wellbeing depends on emotional security, relationships, support, inclusion, and respect. These are fundamentally human dimensions of education. Therefore, the future should not be understood as a competition between teachers and artificial intelligence. The more meaningful vision is one in which teachers and AI complement each other. AI can process information, identify patterns, generate resources, and provide personalized assistance. Teachers can interpret those insights, understand students as individuals, provide empathy, inspire curiosity, develop values, and make responsible educational decisions. The smart teacher of the future, therefore, will not be the teacher who uses the greatest number of AI tools. The smart teacher will be the teacher who knows when to use AI, how to use it, when to question it, and when human interaction must take priority. In this sense, the future of education should be described not simply as Artificial Intelligence in Education, but as Human Intelligence working with Artificial Intelligence for better education. The ultimate objective should be to create learning environments where technology supports—not replaces—human connection, student agency, teacher professionalism, inclusion, and wellbeing. As UNESCO's teacher competency framework emphasizes, AI adoption should remain human-centred, with meaningful teacher-student interaction and human flourishing at the heart of education.

Thus, AI can become a powerful instrument for shaping smart teachers and smart learning environments, provided that innovation is guided by ethics, empathy, equity, and educational purpose.

ARTIFICIAL INTELLIGENCE IN EDUCATION: RETHINKING STUDENT ENGAGEMENT AND WELL-BEING IN SMART LEARNING ENVIRONMENTS

Dr. Shashikala G. M.
Assistant Professor, M. M. College of Education, Davangere

Abstract

Artificial Intelligence (AI) is rapidly transforming educational practices by creating smart learning environments that offer new possibilities for personalized, adaptive, and interactive learning. The integration of AI-powered tools in education has the potential to reshape how students participate in learning, interact with educational content, receive feedback, and manage their learning experiences. However, increasing dependence on AI also raises important questions regarding students' emotional, social, psychological, and digital well-being. Against this background, the present thematic paper explores the changing dimensions of student engagement and well-being in AI-enabled smart learning environments. The paper is based on a review and synthesis of secondary sources, including research studies, scholarly literature, policy documents, and reports related to Artificial Intelligence in Education, student engagement, personalized learning, and learner well-being. The paper examines how AI can enhance student engagement through personalized learning pathways, intelligent feedback, interactive learning experiences, adaptive content, learning analytics, and greater accessibility. It further explores the potential contribution of AI to student well-being by supporting flexible learning, reducing certain academic barriers, and facilitating timely academic assistance. At the same time, the analysis highlights emerging concerns such as excessive screen exposure, technology dependence, reduced human interaction, academic pressure, privacy and data protection, algorithmic bias, misinformation, and the potential impact of AI on students' autonomy and emotional well-being. The paper emphasizes that technological advancement alone cannot ensure meaningful engagement or holistic well-being. The role of teachers remains crucial in providing emotional support, meaningful human interaction, ethical guidance, and pedagogical mediation. The paper argues for a human-centred approach to AI integration in education, where Artificial Intelligence complements rather than replaces teachers and human relationships. It concludes that smart learning environments should aim not merely to produce technologically capable learners but to foster engaged, emotionally healthy, autonomous, responsible, and future-ready learners.

Keywords: *Artificial Intelligence, Student Engagement, Student Well-being, Smart Learning Environments, Personalized Learning, Human-Centred Education, AI in Education*

1. Introduction

1.1 Background of the Study

Education is undergoing a significant transformation as digital technologies become increasingly integrated into teaching, learning, assessment and educational management. Among these technologies, Artificial Intelligence (AI) has emerged as one of the most influential developments because of its capacity to analyse information, recognize patterns, generate content, support decision-making and interact with users through natural language. The rapid development of generative AI has further expanded the educational possibilities of AI, enabling students and teachers to use conversational systems for explanations, idea generation, feedback, translation, content creation and learning support. Consequently, AI is

no longer viewed only as a specialized technological application; it is increasingly becoming part of the everyday learning environment. The emergence of AI in education has created the possibility of moving beyond static digital learning towards more adaptive and responsive learning environments. AI-supported systems can analyse learners' interactions and performance and may recommend resources, modify learning pathways, provide feedback or support individualized learning. Reviews of research in Artificial Intelligence in Education have identified personalized learning, assessment, prediction, profiling, modelling and support for teachers and learners among important areas of development (Mustafa et al., 2024). These developments have contributed to the idea of the smart learning environment, in which technology is expected to respond intelligently to learner needs. However, the educational significance of AI cannot be determined simply by its technological capabilities. Education is fundamentally a human and social process. Learning involves motivation, attention, emotions, relationships, identity, communication, collaboration and a sense of belonging. Therefore, the introduction of AI raises a central question: can intelligent technologies make learning smarter without making education less human? This question becomes particularly important when considering student engagement and well-being. An AI system may provide rapid answers, but educational value depends on whether students are thinking, questioning, participating, collaborating and developing confidence in their own learning. UNESCO's guidance on generative AI in education emphasizes that AI should be introduced through a human-centred approach that considers inclusion, equity, privacy, safety, ethical validation and meaningful educational purposes (UNESCO, 2023). This perspective shifts the discussion from 'how much AI can be used' to 'how AI can be used responsibly to improve learning and human development.' The present thematic paper adopts this human-centred perspective.

1.2 Artificial Intelligence in the Changing Educational Landscape

AI has gradually moved from rule-based and specialized educational applications towards more flexible systems capable of interacting with learners and teachers. Earlier intelligent tutoring systems focused on providing individualized instruction and feedback. Contemporary AI-enabled systems include adaptive learning platforms, learning analytics, recommender systems, automated feedback tools, speech and language technologies, intelligent tutoring systems and generative AI. The increasing availability of generative AI has made interaction with AI more accessible because users can communicate with systems through ordinary language. This development is transforming the traditional relationship among teacher, learner and technology. UNESCO's AI Competency Framework for Teachers describes this emerging relationship as a teacher–AI–student dynamic and identifies 15 competencies across five dimensions: human-centred mindset, ethics of AI, AI foundations and applications, AI pedagogy, and AI for professional learning (Miao & Cukurova, 2024). The framework indicates that teachers require more than technical knowledge; they need the capacity to make pedagogical and ethical decisions about AI. Similarly, UNESCO's AI Competency Framework for Students emphasizes the importance of preparing learners to become responsible and creative users and co-creators of AI. It highlights the need for students to engage with AI safely and meaningfully rather than becoming passive consumers of AI-generated information (UNESCO, 2024). Thus, the future of AI-enabled education requires both smart teachers and

AI-literate students.

1.3 From Smart Technology to Smart Learning

The concept of a smart learning environment refers to a learning context in which technology supports responsiveness, adaptability, interaction and personalization. AI can contribute to such environments by identifying learning patterns, adapting content, recommending resources and providing timely support. Yet, a technologically sophisticated environment is not automatically a smart educational environment. A genuinely smart learning environment should be pedagogically purposeful, inclusive, ethical and responsive to the whole learner. This distinction is particularly important for student engagement. Engagement is not simply the amount of time a learner spends interacting with a digital system. It includes behavioral participation, emotional involvement and cognitive investment in learning. A student may spend considerable time using an AI tool while engaging very little in independent thinking. Conversely, an AI-supported activity that requires students to evaluate information, compare perspectives and construct their own responses may promote deeper engagement. Recent evidence illustrates this complexity. Lo, Hew, and Jong (2024) synthesized 72 empirical studies examining Chat GPT and student engagement and found both engagement and disengagement. Behavioural engagement was prominent, but academic dishonesty was also identified as a form of disengagement. Emotional outcomes were mixed, while evidence concerning cognitive engagement was broader but weaker and included both increased understanding and concerns about reduced critical thinking and overreliance. A 2025 systematic review and meta-analysis likewise reported positive effects of Chat GPT-based learning on behavioral, cognitive and emotional engagement while noting risks such as over-reliance. These findings demonstrate that AI should not be treated as an automatic solution for improving engagement. The quality of the learning task, the student's AI literacy, teacher guidance and the institutional context all influence whether AI promotes meaningful engagement.

1.4 Student Engagement as a Central Educational Outcome

Student engagement is a central indicator of the quality of learning because it reflects how learners participate in and connect with educational experiences. It is commonly discussed through behavioural, emotional and cognitive dimensions. Behavioural engagement includes participation, effort, persistence and task involvement. Emotional engagement includes interest, enjoyment, belonging and attitudes towards learning. Cognitive engagement refers to mental effort, self-regulation, strategic learning, critical thinking and deeper processing. AI can potentially influence all three dimensions. In behavioural terms, AI may increase participation by providing immediate assistance, adaptive practice and interactive dialogue. In emotional terms, personalized support may make learning more relevant and less frustrating. In cognitive terms, AI can provide explanations, examples and prompts that scaffold complex learning. However, the same technology can reduce engagement if students use it to avoid effort, outsource thinking or complete assignments without understanding. The distinction between interaction and engagement is therefore essential. A student who repeatedly prompts an AI system may appear highly active, but activity alone does not establish meaningful learning. Educationally valuable engagement requires learners to remain intellectually

responsible for their decisions, interpretations and final products. This reinforces the importance of AI literacy and teacher mediation.

1.5 Student Well-being in the AI-Enabled Learning Environment

Student well-being is a broader concept than academic success. It includes emotional, psychological, social, academic and digital dimensions. AI may contribute to well-being by providing timely learning support, reducing some barriers to access, supporting self-paced learning and helping students obtain additional explanations. Accessibility technologies such as speech recognition, translation and text-to-speech may also improve participation for learners with diverse needs. At the same time, AI creates new concerns. Students may experience anxiety about inaccurate AI responses, uncertainty about acceptable AI use, pressure to use emerging technologies or concern about privacy. Excessive dependence on AI may affect students' autonomy and confidence in their own abilities. AI-supported surveillance and extensive collection of learner data may also raise concerns about privacy and dignity. These issues demonstrate that well-being must be considered when evaluating the success of smart learning environments. A human-centred approach is therefore essential. AI should support educational relationships rather than replace them. Teachers, peers, counsellors and other human professionals remain important sources of empathy, encouragement, social connection and contextual judgment. AI can assist learning, but it should not be treated as a substitute for the human support systems that contribute to student well-being.

1.6 Theoretical Background

The conceptual foundation of this thematic paper draws particularly on the multidimensional view of student engagement and on human-centred approaches to AI. The three-dimensional engagement perspective distinguishes behavioural, emotional and cognitive engagement and provides a useful lens for examining how AI influences different aspects of students' participation in learning. This framework is especially relevant because AI may have different effects across dimensions; for example, it may increase behavioural activity while simultaneously creating risks to cognitive independence. The paper also draws on principles associated with self-determination and learner autonomy. From this perspective, students are more likely to experience positive learning conditions when they have meaningful opportunities for autonomy, competence and relatedness. AI can support autonomy by enabling self-paced exploration and can support competence through scaffolding and feedback. However, excessive automation may weaken autonomy, while reduced teacher and peer interaction may undermine relatedness. Thus, AI needs to be designed and mediated in ways that preserve these human motivational needs.

1.7 Conceptual Perspective of the Present Paper

The conceptual position adopted in this paper is that AI capabilities do not directly determine student engagement and well-being. Instead, their effects are shaped by the quality of the smart learning environment and by mediating conditions. AI capabilities include personalization, adaptive learning, feedback, generative interaction, learning analytics and accessibility support. These capabilities can create opportunities for meaningful learning, but they can also create risks such as overreliance, privacy concerns, misinformation and reduced human interaction.

Teacher facilitation is positioned as a central mediator. Teachers determine how AI is integrated into learning activities, verify AI-generated information, establish ethical boundaries and maintain human interaction. Learner AI literacy is another mediator because students need to understand what AI can and cannot do and must be able to evaluate its outputs critically. Ethical governance and equitable access provide institutional conditions that influence whether AI benefits are distributed fairly.

Within this conceptual perspective, student engagement and well-being are interconnected outcomes. Meaningful engagement can contribute to students' sense of competence and academic well-being, while positive well-being can create conditions for sustained participation. Conversely, disengagement, anxiety, overdependence or lack of belonging may negatively influence both learning and well-being.

1.8 Objectives of the Study

The present thematic paper is guided by the following objectives:

- To examine the role of Artificial Intelligence in the development of smart learning environments.
- To analyse the potential influence of AI on behavioural, cognitive, emotional and social dimensions of student engagement.
- To examine the potential contribution of AI-enabled learning environments to different dimensions of student well-being.
- To identify the major opportunities and challenges associated with AI-supported student engagement and well-being.
- To examine the changing role and competencies of teachers in human-centred AI-enabled education.
- To propose a conceptual framework linking AI capabilities, smart learning environments, teacher mediation, student engagement and well-being.

2. Method Adopted

The present paper adopted a qualitative thematic literature review approach based entirely on secondary data. The method was selected because the purpose of the paper is to synthesize existing knowledge and develop a coherent conceptual understanding of the relationship between Artificial Intelligence (AI), student engagement and student well-being in smart learning environments.

The analysis considered both convergent and divergent findings. Positive possibilities such as personalization, timely feedback, accessibility and interactive learning were examined alongside concerns relating to overdependence, academic integrity, misinformation, privacy, bias, digital inequality and reduced human interaction. This balanced approach was adopted because the educational impact of AI is context-dependent and is influenced by the quality of pedagogy, teacher mediation, learner AI literacy and institutional governance. The study is limited to secondary literature concerning AI in educational and learning contexts, with particular emphasis on student engagement and well-being.

3. Artificial Intelligence in Smart Learning Environments

Artificial Intelligence in Education (AIED) is moving education from relatively fixed digital environments towards increasingly adaptive, interactive and data-informed learning

environments. AI applications now include intelligent tutoring systems, adaptive learning, learning analytics, recommender systems, automated feedback, conversational agents and generative AI. Recent reviews indicate that personalized learning, assessment, prediction and support for teachers and learners are among the most frequently discussed educational applications of AI (Mustafa et al., 2024).

A smart learning environment should not, however, be defined merely by the presence of sophisticated technology. It is better understood as an educational environment in which digital systems respond to learner needs while remaining connected to pedagogical goals, teacher judgement and human values. UNESCO (2023) emphasizes that generative AI should be introduced through a human-centred approach that protects privacy, promotes equity and ensures meaningful educational use. In this sense, the 'smartness' of an educational environment depends not only on what AI can do, but also on how intelligently and responsibly educators use it.

The development of AI-enabled environments creates an important link with the present conference theme. Smart teachers are required to interpret AI outputs, select appropriate tools, design meaningful learning activities and safeguard students' learning and well-being. UNESCO's AI Competency Framework for Teachers identifies five broad competency dimensions—human-centred mindset, ethics of AI, AI foundations and applications, AI pedagogy, and AI for professional learning—showing that teacher competence is central to effective AI integration (Miao & Cukurova, 2024).

4. AI and Student Engagement

Student engagement is a multidimensional construct involving students' participation, effort, attention, emotional involvement and cognitive investment in learning. In an AI-enabled environment, engagement may be influenced through personalization, immediate feedback, conversational interaction, adaptive challenge, content generation and opportunities for learner choice. A systematic review of 72 empirical studies examining ChatGPT and student engagement found comparatively strong evidence concerning behavioural engagement with the technology itself, but also evidence of disengagement, including academic dishonesty. The review also identified mixed emotional outcomes and highlighted the need for stronger objective measures and longer-term research (Lo et al., 2024).

AI can support behavioural engagement by making learning activities more interactive and responsive. Conversational systems may enable students to ask questions repeatedly without waiting for teacher availability. Adaptive platforms may provide tasks at different levels of difficulty, while AI-generated practice questions can offer additional opportunities for participation. Such features may be especially valuable for learners who hesitate to ask questions publicly or who require repeated practice.

Cognitive engagement concerns the extent to which learners invest mental effort, use strategies and engage in deeper thinking. AI may support cognitive engagement when it is used to compare explanations, challenge assumptions, generate alternative perspectives or provide scaffolding. However, cognitive engagement may be weakened when learners simply accept generated answers. Therefore, the educational value of AI depends on whether students are positioned as active evaluators and creators rather than passive recipients.

Emotional engagement refers to learners' interest, enjoyment, sense of belonging and emotional connection with learning. AI-supported personalization may make learning experiences more relevant, while conversational tools may create a perception of responsive support. At the same time, excessive technology use, inaccurate responses, anxiety about AI, or reduced human interaction may negatively affect emotional engagement. The mixed findings reported by Lo et al. (2024) reinforce the need to consider both sides.

Social engagement is also important. Learning is not only an individual cognitive process; interaction with teachers and peers contributes to belonging and collaborative meaning-making. AI should therefore be designed to complement—not replace—human interaction. A smart learning environment that maximizes individual AI interaction while reducing peer discussion and teacher contact may be technologically advanced but educationally impoverished.

Table 1. Dimensions of Student Engagement and Potential AI Contributions

Dimension	Possible AI contribution	Potential concern
Behavioural	Interactive tasks, adaptive practice, reminders, conversational support	Surface-level interaction or excessive dependence
Cognitive	Scaffolding, explanations, alternative examples, questioning prompts	Reduced independent thinking if answers are accepted uncritically
Emotional	Personalized support, accessible assistance, confidence-building feedback	Anxiety, frustration, emotional overdependence or reduced human connection
Social	Collaborative AI-supported activities, language/communication support	Reduced peer interaction if AI replaces collaborative learning

5. AI and Student Well-being

Student well-being extends beyond academic achievement and includes emotional, psychological, social, academic and digital dimensions. AI can influence these dimensions positively or negatively. For example, personalized support may reduce frustration associated with learning difficulties, while accessibility technologies may increase participation. Conversely, surveillance, privacy concerns, excessive screen exposure, dependence on AI, inaccurate feedback and social isolation may create new pressures. AI may support academic well-being by helping students understand difficult concepts, receive immediate formative feedback and access learning resources. When used as a supplementary learning assistant, generative AI may reduce some barriers to independent study. However, academic well-being is not simply the reduction of effort. Meaningful learning requires productive struggle, reflection and the development of confidence in one's own capabilities. If students become dependent on AI for routine intellectual work, their sense of competence and autonomy may be affected. Emotional and psychological well-being requires particular attention. Students may use AI systems for explanations, encouragement or guidance, but educational institutions should avoid presenting AI as a substitute for human counselling, pastoral care or professional support. AI systems can misinterpret context and may produce unreliable or inappropriate responses. Human adults remain essential for situations requiring empathy, safeguarding and professional judgement. Digital well-being is another emerging consideration. Smart learning

environments may increase the amount of time students spend interacting with screens and digital systems. A human-centred design should therefore consider purposeful technology use, opportunities for offline learning, face-to-face interaction and healthy boundaries. Recent research on responsible AI governance in education identifies student well-being alongside privacy, fairness, transparency and human oversight as a major ethical area (Zhu et al., 2025).

Table 2. Student Well-being Dimensions in AI-Enabled Learning

Dimension	Possible benefit	Possible risk
Academic well-being	Timely support, feedback, personalized learning	Overdependence, reduced productive struggle
Emotional well-being	Accessible assistance and personalized encouragement	Anxiety, frustration, inappropriate AI responses
Psychological well-being	Support for confidence and self-paced learning	Loss of autonomy or excessive reliance
Social well-being	Communication and inclusive participation	Reduced human/peer interaction
Digital well-being	Efficient access to learning resources	Screen fatigue, constant connectivity, surveillance concerns

6. Opportunities

The literature suggests several opportunities for AI to strengthen educational experiences when its use is pedagogically purposeful. The first is personalization. AI can process patterns in learning activity and support adaptive content, resources and feedback. Reviews of AIED consistently identify personalization as a major potential benefit (Mustafa et al., 2024).

A second opportunity is timely feedback. AI can help students obtain immediate formative responses and can assist teachers in identifying common errors or misconceptions. A third opportunity is accessibility. Translation, speech recognition, text-to-speech and other AI-enabled tools may reduce barriers for learners with different linguistic or accessibility needs. UNESCO (2023) recognizes inclusive access as an important consideration in the use of generative AI. A fourth opportunity is learner autonomy. Students can use AI to explore questions, generate examples, compare perspectives and receive additional explanations at their own pace. This may be particularly valuable when AI use is embedded in tasks that require students to evaluate and transform AI outputs rather than copy them.

A fifth opportunity is teacher support. AI may reduce time spent on selected routine tasks, allowing teachers to devote more attention to instructional design, individual support, discussion and relationships. This should be viewed as augmentation rather than replacement. UNESCO's teacher competency framework explicitly emphasizes human agency and the need for teachers to determine how and when AI should be used (Miao & Cukurova, 2024).

Table 3. Opportunities Created by AI in Education

Opportunity	Educational value	Condition for meaningful use
Personalization	Responds to learner differences	Accurate data and teacher oversight
Immediate feedback	Supports formative learning	Feedback must be interpreted and acted upon
Accessibility	Reduces barriers to participation	Inclusive design and equitable access
Learner autonomy	Supports self-paced	AI literacy and critical

	exploration	evaluation
Teacher support	Assists routine and information-intensive work	Teacher remains responsible for pedagogical decisions
Engagement	Interactive and responsive learning experiences	Activities must require active thinking
Early support	May identify patterns associated with learning difficulty	Human verification before intervention

7. Challenges and Risks

The benefits of AI are accompanied by substantial challenges. Privacy and data protection are major concerns because AI-enabled learning environments may collect extensive information about learner behaviour, performance and interaction. Responsible governance therefore requires clarity about what data are collected, why they are collected, who can access them and how long they are retained. UNESCO (2023) places data privacy among the key conditions for responsible use of generative AI in education.

Algorithmic bias is another concern. AI systems may reproduce or amplify biases present in training data, design assumptions or evaluation processes. This can affect recommendations, language generation, assessment and access. Transparency is also challenging because users may not understand why a system produced a particular recommendation or output. Recent systematic reviews identify bias, privacy and transparency as recurring ethical concerns in AI-enabled education (Zhu et al., 2025).

Academic integrity is particularly relevant to student engagement. When students use generative AI to complete assignments without meaningful intellectual participation, visible task completion may increase while genuine engagement decreases. Lo et al. (2024) found academic dishonesty to be a significant form of disengagement in the emerging ChatGPT literature. This suggests that institutions should move beyond simple prohibition and develop assessment practices that value process, reflection, oral explanation, collaboration and responsible AI disclosure.

Overreliance is another risk. Students may accept AI-generated information because it is fluent and confident, even when it is inaccurate. This creates a need for AI literacy, source evaluation and critical thinking. Similarly, teachers may overtrust AI-generated recommendations or assessment outputs. Human oversight is therefore not an optional add-on; it is a core safeguard.

Table 4. Major Risks and Possible Safeguards

Risk	Possible consequence	Suggested safeguard
Privacy/data misuse	Exposure or inappropriate use of learner data	Data minimization, privacy policies and informed governance
Bias and unfairness	Unequal or inaccurate recommendations	Bias testing, diverse data and human review
Misinformation	Students learn inaccurate content	Source verification and teacher checking
Academic dishonesty	Reduced authentic engagement	Process-based assessment and AI-use disclosure
Overdependence	Reduced autonomy and critical thinking	Tasks requiring independent reasoning and reflection

Digital inequality	Unequal access to benefits	Institutional access and inclusive design
Reduced human interaction	Weaker belonging and relationships	Protected teacher and peer interaction
Digital fatigue	Reduced well-being	Purposeful use and healthy technology boundaries

8. Role of Teachers

The teacher's role becomes more—not less—important in AI-enabled education. AI can process information rapidly, but teachers understand learners within social, cultural and emotional contexts. UNESCO's 2024 AI Competency Framework for Teachers describes the emerging teacher–AI–student dynamic and identifies 15 competencies across five dimensions: human-centred mindset, ethics of AI, AI foundations and applications, AI pedagogy and AI for professional learning (Miao & Cukurova, 2024). Teachers act first as learning designers. They decide whether AI adds educational value to a particular task and design activities that promote inquiry, collaboration and reflection. Second, teachers act as critical evaluators by checking AI outputs for accuracy, relevance, bias and appropriateness. Third, teachers act as ethical guides by helping students understand responsible AI use, privacy, attribution and academic integrity. Teachers also provide the human relationship that AI cannot adequately reproduce. Encouragement, empathy, classroom belonging, conflict resolution and contextual judgement remain central to education. The teacher therefore becomes a mediator between technological possibility and educational purpose. Teacher professional development should consequently include not only tool-specific skills but also AI pedagogy, ethics, critical evaluation and well-being-oriented design.

9. Human-Centred AI

Human-centred AI provides the central normative principle of this paper. It means that AI should serve human learning, agency, dignity and well-being rather than allowing technological efficiency to become the primary educational goal. UNESCO (2024) places human agency, ethics, inclusion and accountability at the centre of teacher AI competencies, while its student framework emphasizes preparing learners to engage with AI safely and meaningfully. A human-centred approach requires five balances: technology and human interaction; personalization and learner autonomy; automation and teacher judgement; innovation and ethical safeguards; and efficiency and well-being. These balances are especially important because AI systems can optimize measurable indicators without necessarily improving the quality of educational experience. AI should therefore be treated as an educational partner or support system, not as a replacement for teachers or learners' own intellectual activity. The objective is not to create classrooms with maximum AI use, but learning environments where AI is used selectively when it improves learning, engagement, inclusion or well-being.

10. Proposed Conceptual Framework

The framework proposes that a human-centred smart learning environment can strengthen behavioural, cognitive, emotional and social engagement while supporting academic, emotional, psychological, social and digital well-being. At the same time, risks such as dependence, privacy concerns, bias and reduced human interaction can weaken these

outcomes. The teacher therefore functions as a central mediator and ethical safeguard.

Figure1. Proposed Conceptual Framework for AI, Student Engagement and Well-being

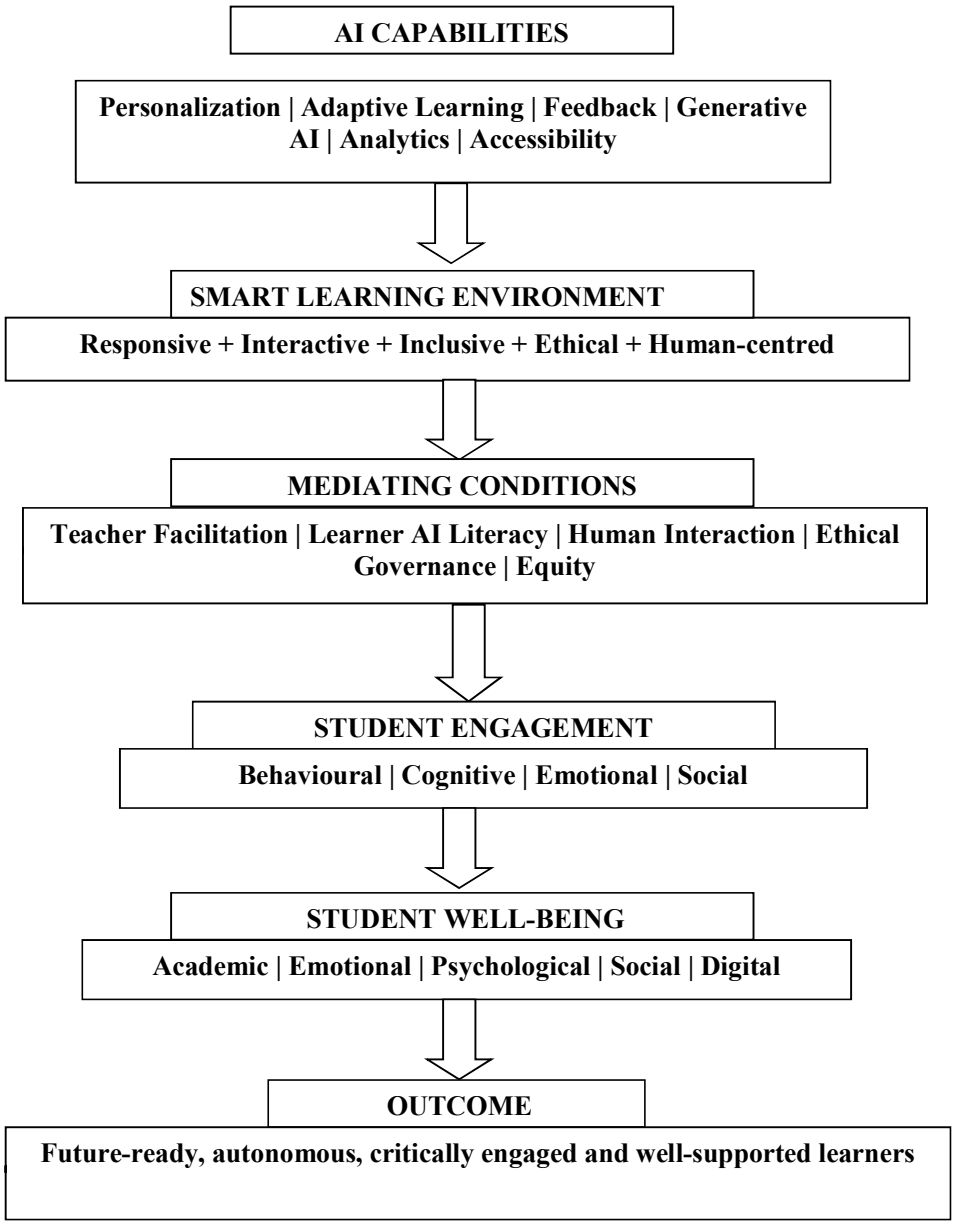

Table 5. Components of the Proposed Conceptual Framework

Component	Key elements	Expected role
AI capabilities	Personalization, adaptation, feedback, generation, analytics, accessibility	Create responsive learning opportunities
Smart environment	Interactive, inclusive, adaptive, ethical	Provide the context in which AI operates
Mediators	Teacher facilitation, AI literacy, human interaction, governance	Determine quality and direction of AI use
Engagement	Behavioural, cognitive, emotional, social	Immediate learner-level outcome
Well-being	Academic, emotional, psychological, social, digital	Holistic learner outcome
Longer-term outcome	Autonomy, critical thinking, responsible AI use	Future-ready learner development

11. Implications

For teachers, the findings imply a shift from being users of digital tools to becoming designers and evaluators of AI-supported learning. Teachers need opportunities to develop AI literacy, prompt and interaction skills, output verification, ethical judgement and AI pedagogy. For teacher education institutions, AI should be integrated across coursework and practicum rather than treated as a one-time technology workshop.

For schools and colleges, AI adoption should be accompanied by clear policies on privacy, academic integrity, assessment and responsible use. Institutions should also ensure equitable access so that AI does not increase existing digital inequalities. For curriculum developers, AI literacy should include not only how AI works, but also how to question outputs, recognize bias, protect data and use AI responsibly.

For policymakers, the central implication is that AI policy should measure educational and human outcomes, not simply technology adoption. UNESCO's frameworks provide a useful reference for building national and institutional approaches around human agency, ethics, AI foundations, pedagogy and professional learning (Miao & Cukurova, 2024).

12. Recommendations

1. Develop AI literacy programmes for both teachers and students, with emphasis on critical evaluation and responsible use.
2. Integrate AI pedagogy into teacher education and continuous professional development.
3. Adopt clear institutional guidelines for privacy, data protection, academic integrity and disclosure of AI use.
4. Use AI primarily where it adds clear pedagogical value rather than adopting tools for technological novelty.
5. Design assessments that emphasize reasoning, reflection, application, oral explanation and learning processes.
6. Maintain meaningful teacher–student and peer interaction in AI-enabled environments.
7. Provide equitable access to devices, connectivity, appropriate AI tools and support.
8. Establish human oversight for high-stakes decisions such as assessment, progression and

student support.

9. Promote digital well-being through purposeful technology use and balanced online/offline learning.

13. Research Gaps and Future Directions

The literature reveals important gaps. First, many studies examine short-term perceptions or immediate learning experiences, whereas the long-term effects of AI on engagement, autonomy, critical thinking and well-being remain less clear. Second, research should use stronger objective measures of engagement rather than relying primarily on self-report. Lo et al. (2024) specifically called for extended studies and objective measures.

Third, more research is required across different educational levels, disciplines, languages and cultural contexts. AI systems may behave differently across linguistic and cultural environments, and evidence concentrated in particular countries cannot automatically be generalized. Fourth, more research is needed on teacher mediation: which forms of teacher guidance produce beneficial engagement and which patterns of AI use increase dependency?

Fifth, student well-being requires more direct and multidimensional measurement. Future research should examine emotional, psychological, social and digital well-being alongside academic outcomes. Sixth, longitudinal and mixed-method studies could help explain how students' AI literacy develops and how sustained AI use changes learning habits.

Finally, research should investigate governance and ethical safeguards in real educational settings. Recent reviews identify privacy, bias, transparency, well-being and human oversight as interconnected governance issues (Zhu et al., 2025). Future research should therefore move from identifying ethical risks to testing practical institutional and classroom-level solutions.

Table 6. Priority Areas for Future Research

Research gap	Suggested direction
Long-term effects	Longitudinal studies of engagement, autonomy and well-being
Measurement	Objective and validated measures of multidimensional engagement
Context diversity	Studies across school, higher education, vocational and teacher education contexts
Cultural/linguistic diversity	Research across languages, regions and cultural settings
Teacher mediation	Examine how teacher guidance changes AI outcomes
Well-being	Multidimensional assessment of emotional, psychological, social and digital well-being
Ethical governance	Evaluate privacy, bias, transparency and human-oversight mechanisms
Assessment	Develop assessment models that preserve authentic learning in the presence of generative AI

14. Conclusion

Artificial Intelligence has the potential to reshape educational environments by making learning more adaptive, interactive, personalized and accessible. However, the central

question is not whether AI should enter education, but how it should be integrated so that technological capability contributes to meaningful learning. The literature indicates that AI can support student engagement through personalization, feedback, interaction and accessibility, but it can also create disengagement through academic dishonesty, overreliance and passive use (Lo et al., 2024).

Student well-being must therefore remain a central criterion for evaluating smart learning environments. AI-enabled education should protect privacy, support autonomy, preserve human relationships, promote inclusion and avoid unnecessary digital burden. The teacher remains indispensable as a learning designer, critical evaluator, ethical guide and source of human support. UNESCO's AI competency framework reinforces this position by placing human-centred mindset, ethics, AI pedagogy and professional learning at the core of teacher competence (Miao & Cukurova, 2024).

The proposed conceptual framework positions AI capabilities, smart learning environments, teacher mediation and ethical governance as interconnected conditions influencing student engagement and well-being. The future of smart education should therefore not be measured by the amount of AI used, but by the quality of learning and human development it enables. Smart teachers, supported by responsible AI, can help create smart learning environments in which technology enhances rather than diminishes human agency, critical thinking, relationships and well-being.

ARTIFICIAL INTELLIGENCE FOR TEACHER EDUCATOR

Sushma P K
Research Scholar, Department of Education, Karnataka University, Dharwad
Dr N S Talawar
Associate Professor, Karnatak University's, College of Education, Dharwad

Abstract

By improving teaching, learning, evaluation, research, and professional development, artificial intelligence (AI) is revolutionizing teacher education. Teacher educators may create individualized learning experiences, automate routine duties, give prompt feedback, and enhance instrumental preparation with AI powered technologies. Future educators are more equipped to teach in highly technological classrooms thanks to the implementation of AI into teacher education. The idea to artificial intelligence (AI) for teacher educators is examined in this study along with its uses in lesson planning, evaluation, classroom simulations, content production, and educational research. Additionally, it emphasizes the advantages of AI, such as increased productivity, individualized education, increased student involvement, and assistance with data driven decision-making. The study also deals with important issues such as algorithmic bias, data privacy, ethical issues, digital inequality, and requirements for ongoing professional growth. The study comes to the conclusion that rather than taking on the role of teacher educators, AI should be seen as helpful tool. Responsible use, moral behaviour, and teacher educators' active participation in advocating critical thinking, creativity, and human centred learning are all necessary for its successful implementation. Institutions can produce talented, creative, and future-ready teachers who can meet the demands pf 21st century education by carefully incorporating AI into teacher education.

Introduction: Artificial Intelligence (AI) is revolutionizing teacher education by enriching instruction, learning, evaluation, and professional improvement. Teacher educators leverage AI to equip future teachers with contemporary skills, boost teaching effectiveness, and deliver customized learning experiences. AI functions as a supportive resource that supplements, rather than acts as a replacement for, the expertise and skills of teacher educators.

Meaning: AI for teacher educators incorporates applying intelligent computer system and AI-driven tools to assist in preparing teacher, planning instruction, performing appraisals, performing research, and supporting professional progress.

Goals:

- Elevate the standard of teacher training.
- Tailor the learning experience for each student teacher
- Strengthen both digital skills and teaching abilities.
- Facilitate evaluation and productive feedback.
- Encourage new approaches in teaching and learning.

Uses of AI for Teaching Educators:

1. Lesson Planning : AI helps design lesson plans, instructional content, and classroom exercises.
2. Assessment and Evaluation : AI creates quizzes, grades assignments, and offers real-time feedback.
3. Personalized Learning : AI suggests learning resources customized for student teachers.

4. Research Support : AI helps with literature reviews, data analysis, summarization, and research writing.
5. Professional Development : AI recommends training courses and supports educators in refining their teaching skills.
6. Classroom Simulation : AI-driven virtual classrooms give student teachers the chance to practice teaching in realistic settings.
7. Content Creation : AI produces presentations, worksheets, exam papers, and teaching aids.

Advantages

- Reduces time spent on repetitive tasks.
- Elevates the standard of teaching.
- Enables evidence-based choices.
- Encourages innovative methods for teaching.
- Supplies prompt and customized feedback.
- Reinforces the digital abilities of future teachers.

Challenges

- Educational data must remain confidential and safe that's a real concern.
- Depending too heavily on AI introduces its own threats.
- AI could produce information that's inaccurate or biased.
- Teacher educators need ongoing training that's a must.
- Not everyone has equal access to AI tools this creates a gap.

Ethical Considerations

- Keep student data safe and respect their privacy.
- Ensure equipment treatment for all. Watch out for hidden biases in system.
- Ensure equitable treatment for all. Watch out for hidden biases in system.
- Be open about how AI helps with decisions.
- Use AI the right way. Don't let it become a tool for cheating or copying.
- Always double-check anything AI produces before you bring it into your teaching.

Role of Teacher Educators

- Being AI into teacher training programs.
- Demonstrate to prospective educators how to apply AI in a responsible and ethical way.

- Support pre-service teachers in cultivating critical thinking skills and digital know – how.
  - Push for AI as a useful aid – not a replacement that steals over a teacher's job.
  - Lead by example when using AI during classroom lessons.

Conclusion: Artificial Intelligence is now a key tool in educating teachers. It assists in teaching, learning, checking student work, and promoting teachers' career advancement. Simultaneously, it gets future teachers ready for classrooms that have a lot of digital tools. For AI to succeed, teachers need to follow honest practices and continue acquiring new skills. Teacher educators also need to guide their students in using AI (so it leads to real and useful learning).

PLANNING AND DEVELOPMENT OF SECONDARY EDUCATION THROUGH DIFFERENT EDUCATIONAL POLICIES

Sri. Basappa C Yeraladinni
Research Scholar, PG Department of Studies in Education, Karnatak University.Dharwad Email: yeraladinni@gmail.com
Dr.N.S.Talawar,
Associate Professor, Karnatak University's College of Education Dharwad

Abstract

Secondary education occupies a pivotal position in the architecture of a nation's schooling system, functioning as the bridge between elementary schooling and higher education or the world of work. This article traces the planning and development of secondary education in India through a chronological review of the principal national commissions and policies that have shaped it since independence, namely the University Education Commission (1948-49), the Secondary Education Commission (1952-53), the Education Commission (1964-66), the National Policy on Education (1968 and 1986/92), the Right of Children to Free and Compulsory Education Act (2009), the Rashtriya Madhyamik Shiksha Abhiyan, the Samagra Shiksha Abhiyan, and the National Education Policy (2020). Drawing on official policy documents and nationally compiled education statistics, the article shows that successive policies have progressively expanded the scope of secondary education planning, from an early emphasis on curricular diversification to a contemporary emphasis on equity, flexibility, competency-based assessment and rural-urban parity. the article concludes that while policy articulation has been consistent in its broad aims across seven decades, translating these aims into adequate rural secondary school provision continues to depend on the strength of state- and district-level planning mechanisms.

Keywords: *Secondary Education, Educational Planning, Educational Policy, Kothari Commission, National Education Policy 2020, Rural Education*

1. Introduction:

Education is widely regarded as the most powerful instrument available to a nation for achieving social, economic, and cultural transformation, a view articulated explicitly by India's Education Commission of 1964-66, which held that the destiny of a country is shaped in its classrooms (Kothari Commission, 1966, ch.1, para-1.02). Within the broader architecture of schooling, secondary education, comprising the classes that follow elementary schooling and precede higher education, occupies a strategic position because it is the stage at which foundational learning is consolidated, adolescent aptitudes are identified, and pathways towards higher study or skilled employment are effectively determined. The manner in which secondary education is planned, therefore, has consequences that extend well beyond the individual classroom into the labor market and the wider society. India's approach to secondary education planning has evolved considerably since independence, shaped by a succession of national commissions and policy statements, each responding to the perceived limitations of its predecessor and to the changing developmental priorities of the country. This article undertakes a chronological review of these successive policies, examining how each

has contributed to the planning and development of secondary education, with particular attention to issues of access, equity, curriculum, and rural-urban parity. the article is organized as follows: Section 2 reviews the principal educational policies and commissions relevant to secondary education planning and development, Section 3 discusses the cumulative significance of this policy trajectory for the present state of secondary education; and Section 4 concludes with observations on the continuing relevance of systematic, evidence-based planning at the state and district level.

2. Educational Policies Related to Planning and Development of Secondary Education:

2.1 University Education Commission (1948-49)

The University Education Commission, chaired by Dry S. Radhakrishnan, was constituted primarily to examine higher education, but its report drew explicit attention to the inadequacy of the secondary education then feeding into the university system, thereby placing the reform of secondary schooling on the national policy agenda even before a dedicated commission had been established to examine it (University Education Commission, 1950). The Commission's observations on the weak preparatory value of prevailing secondary schooling were an important early impetus for the more focused review that followed within a few years. Although the Radhakrishnan Commission did not itself issue detailed recommendations for the reform of secondary schooling, its diagnosis that university entrants frequently arrived without adequate command of language, basic science or independent study skills implied, by logical extension, that the school stage immediately preceding higher education required dedicated policy attention in its own right. This diagnostic contribution is significant for the present review because it establishes that concern with the planning and quality of secondary education in independent India predates, and in part motivated, the appointment of a commission focused on secondary education specifically, illustrating the interconnected and cumulative character of India's post-independence education policy process from its earliest years.

2.2 Secondary Education Commission (1952-53)

The Secondary Education Commission, generally known as the Mudaliar Commission after its chairman Dr A. Lakshmanaswami Mudaliar, was the first commission in independent India devoted exclusively to secondary education. Its report recommended the diversification of courses beyond a narrowly academic curriculum, the introduction of a multipurpose school structure combining academic and vocational streams within a single institution, the establishment of guidance and counselling services to assist adolescent learners in identifying suitable educational and occupational pathways, and reform of the examination system to reduce excessive reliance on rote memorization (Secondary Education Commission, 1953). These recommendations established secondary education as a distinct field of national policy concern, separate from both elementary and university education, a distinction retained in every subsequent policy statement. Among the Mudaliar Commission's most consequential planning-related recommendations was its proposal that secondary education be treated as a distinct seven-year stage following four years of primary education, with the secondary stage itself subdivided into a lower stage oriented towards general education and a higher stage offering diversified academic and vocational streams, including technical, commercial,

agricultural, and fine arts options alongside the conventional humanities and science streams. The Commission also recommended the strengthening of state-level Boards of Secondary Education to standardize curricula and examinations, and it drew explicit attention to the need for improved teacher training specific to the secondary stage, recognizing that the diversification of curriculum it proposed could not be realized without a correspondingly diversified and adequately trained teaching workforce, a planning concern that recurs, in updated form, in every subsequent national policy on secondary education, including the National Education Policy of 2020.

2.3 Education Commission / Kothari Commission (1964-66)

The Education Commission of 1964-66, popularly known as the Kothari Commission after its chairman Dr D. S. Kothari, undertook the most comprehensive review of Indian education conducted in the post-independence period. Its report, titled Education and National Development, recommended a common national structure of ten years of general schooling followed by two years of higher-secondary and three years of undergraduate study, widely known as the ten-plus-two-plus-three pattern, together with a three-language formula, free and compulsory education up to the age of fourteen, and the systematic integration of work experience and vocational education into the secondary curriculum (Kothari Commission, 1966, ch. 4). The Commission identified four broad aims that education at every stage ought to serve: increasing productivity by relating schooling to economic needs; promoting social and national integration through a common school system; accelerating modernization through the cultivation of a scientific temper; and nurturing social, moral, and spiritual values (Kothari Commission, 1966, ch. 1, paras 1.20-1.24). These recommendations formed the substantive basis of India's first comprehensive National Policy on Education. With specific regard to planning, the Kothari Commission was notable for recommending that a defined proportion of national income, subsequently popularized as a target of six per cent of Gross National Product, be allocated to education, and for recommending the establishment of stronger state-level planning and evaluation machinery to translate national educational goals into state-specific targets and budgets (Kothari Commission, 1966, ch. 1, para 1.24). The Commission additionally recommended the adoption of a common school system of public education, open to children of all social and economic backgrounds, as a means of avoiding the emergence of a socially segregated, two-tier schooling system in which the quality of secondary education available to a child would depend on family income rather than on national planning priorities, a concern that anticipates, in substantial part, the equity-focused provisions of much later policy documents.

2.4 National Policy on Education, (1968)

The National Policy on Education, 1968 was India's first comprehensive national statement of educational policy and drew substantially on the recommendations of the Kothari Commission. It endorsed the aim of relating education to the life, needs, and aspirations of the people as the most urgent reform required of the Indian education system, and it recommended the adoption of a broadly uniform national structure of school and higher education across the states, together with greater emphasis on science education and the training of teachers (Government of India, 1968). From a planning perspective, the National Policy on Education,

1968 is significant chiefly for having established, for the first time, a formally endorsed national framework against which state governments could calibrate their own secondary education plans, replacing what had previously been a more fragmented, state-by-state approach to school structure and curriculum. the Policy's call for a substantial increase in public investment in education, together with its emphasis on equalizing educational opportunity and on making science and mathematics an integral part of the school curriculum at every stage, provided the broad planning parameters within which state education departments, including that of the then-unified Mysore State, subsequently reorganized their secondary school systems during the 1970s.

2.5 National Policy on Education, (1986) and Programme of Action (1992)

The National Policy on Education of 1986, together with its associated Programme of Action of 1992, reiterated and elaborated the goals of universal access, qualitative improvement, and the vocationalisation of secondary education first articulated by the Kothari Commission, while placing renewed emphasis on the education of girls, Scheduled Castes, Scheduled Tribes, and other historically disadvantaged groups. A significant development associated with this policy phase was the establishment and expansion of Jawahar Navodaya Vidyalayas, residential schools intended to provide high-quality secondary education to talented rural children irrespective of family income, thereby directly addressing the rural-urban quality gap in secondary schooling (Government of India, 1986; Government of India, 1992). The 1986 Policy and its 1992 Programme of Action are also notable for introducing the concept of minimum levels of learning, an early precursor to the outcome-based and competency-based approaches to curriculum and assessment that would later be more fully developed in the National Curriculum Framework and, subsequently, in the National Education Policy of 2020. At the planning level, this policy phase strengthened the role of District Institutes of Education and Training and of state-level planning bodies in operationalizing national goals, and it introduced Operation Blackboard as a scheme aimed specifically at improving minimum physical facilities in schools, an intervention that, although initially targeted at the primary stage, established an important precedent for subsequent infrastructure-focused planning interventions at the secondary stage.

2.6 Right of Children to Free and Compulsory Education Act, 2009

The Right of Children to Free and Compulsory Education Act, 2009 guarantees free and compulsory education to every child between the ages of six and fourteen in a neighborhood school, and prescribes minimum norms relating to pupil-teacher ratios, building safety, and teacher qualification, together with a requirement that private unaided schools reserve at least twenty-five per cent of entry-level seats for children from disadvantaged and economically weaker sections (Government of India, 2009). Although the statutory guarantee of the Act does not extend to the secondary stage, its neighborhood-school principle and minimum infrastructure norms have influenced subsequent secondary-stage planning guidelines and represent an important legal landmark in the broader trajectory of Indian education policy. The planning significance of the Right of Children to Free and Compulsory Education Act, 2009 for the secondary stage is chiefly indirect but nonetheless considerable. By establishing an enforceable, justiciable right to elementary education, the Act generated,

for the first time, a large and rapidly growing cohort of elementary-school completers whose continued participation in the education system could only be sustained through a corresponding expansion of secondary school capacity. This so-called demographic pressure effect is widely regarded, in the subsequent policy literature, as one of the principal drivers behind the launch of the Rashtriya Madhyamik Shiksha Abhiyan within roughly the same period, since the near-universalization of elementary enrolment achieved under the Act would otherwise have produced a bottleneck at the transition to secondary schooling in the absence of a matching secondary-stage access initiative.

2.7 Rashtriya Madhyamik Shiksha Abhiyan and Samagra Shiksha Abhiyan

The Rashtriya Madhyamik Shiksha Abhiyan was launched with the explicit objective of universalizing access to secondary education and improving its quality across the country, through the opening of new government secondary schools, the strengthening of science and mathematics laboratories, and the provision of transport and residential facilities for students in underserved areas. This scheme was subsequently consolidated, along with schemes for pre-school, elementary, and teacher education, under the umbrella of the Samagra Shiksha Abhiyan, bringing planning and financing for all stages of school education under a single integrated administrative framework intended to improve coordination across stages that had previously been planned and funded separately.

A central planning innovation associated with the Rashtriya Madhyamik Shiksha Abhiyan was its use of norm-based criteria, rather than purely discretionary allocation, to determine which localities qualified for a new secondary school, generally expressed in terms of a maximum permissible distance between a habitation and the nearest existing secondary school. This norm-based approach represented a significant methodological advance over the more ad hoc pattern of secondary school establishment that had characterized earlier decades, and it directly informs the kind of distance- and demand-based planning analysis that district education offices are expected to undertake when identifying candidate locations for new or upgraded secondary schools. The subsequent integration of this scheme within the Samagra Shiksha Abhiyan was intended to extend comparable norm-based planning logic across all stages of school education in a mutually consistent manner, rather than allowing pre-school, elementary, and secondary planning to proceed according to separate and potentially inconsistent norms.

2.8 National Education Policy (2020)

The National Education Policy, (2020) represents the most recent and, in several respects, the most far-reaching policy intervention affecting secondary education planning. It restructures school education into a five-plus-three-plus-three-plus-four curricular framework, under which the Secondary Stage comprises classes nine to twelve, organized into two phases, and envisaged as a stage of multidisciplinary learning and increased flexibility of subject choice, replacing the earlier rigid streaming into arts, science, and commerce (Government of India, 2020, p. 11). The Policy documents a marked decline in Gross Enrolment Ratio through the secondary stage, from 90.9 per cent at the upper-primary stage to 79.3 per cent for classes nine and ten and 56.5 per cent for classes eleven and twelve, and sets an explicit target of achieving a Gross Enrolment Ratio of one hundred per cent from pre-school to secondary

level by 2030 (Government of India, 2020, p. 10). It further commits to a substantial reform of board examinations to reduce dependence on rote preparation and private coaching, to the establishment of a National Assessment Centre known as PARAKH to standardize learning-outcome assessment, and to a range of equity-focused measures, including a Gender-Inclusion Fund, incentives for teachers willing to serve in rural and remote postings, and the reorganization of small, scattered schools into school complexes for shared resourcing (Government of India, 2020, pp. 18-21, 27-29). Complementing this policy architecture, the Unified District Information System for Education Plus continues to provide the empirical basis for monitoring the rural-urban and government-private gaps in infrastructure and staffing that these policy measures are intended to close (UDISE+, 2024, p. 8).

2.9 State-Level Implementation: The Case of Karnataka

National policies of the kind reviewed above are, under India's concurrent constitutional arrangement for education, implemented substantially through state-specific rules, schemes, and administrative machinery. Karnataka has, over successive decades, operationalized the national policy framework through its own state education department and through the district- and taluk-level offices responsible for translating state norms into local school-siting, staffing, and infrastructure decisions. The state has additionally experimented with cluster-based governance models broadly consistent with the school-complex approach subsequently endorsed at the national level, under which a designated senior secondary or high school functions as a resource and coordination hub for a group of smaller, often single-teacher, primary and upper-primary schools situated in its vicinity, with the stated aim of enabling the pooling of subject teachers, laboratory facilities, and library resources that no single small rural school could economically sustain in isolation (Government of India, 2020, pp. 28-29). The extent to which such state-level planning innovations succeed in closing the documented rural-urban gap in secondary school access and quality remains an important and, at present, comparatively under-researched empirical question, one that would benefit from focused district-level study of the kind this review recommends in its concluding section.

2.10 National Curriculum Framework for School Education (2023)

Following the release of the National Education Policy, 2020, the National Council of Educational Research and Training was tasked with developing a National Curriculum Framework for School Education to translate the Policy's broad vision into stage-specific curricular and pedagogical guidance for teachers, textbook writers and state curriculum bodies. The resulting framework, published in 2023, elaborates in considerable detail the subject-wise learning standards, credit-based structure, and multidisciplinary course combinations envisaged for the Secondary Stage, and is intended to serve as the principal instrument through which state education boards, including that of Karnataka, revise their own secondary-stage syllabi and textbooks (NCERT, 2023). From a planning perspective, the Framework is significant because it operates as the crucial intermediate link between broad national policy aspiration and the day-to-day curricular reality experienced by secondary school teachers and students, and its effective, resource-adequate implementation in rural schools constitutes a further, curriculum-specific dimension of the planning challenge examined throughout this review.

3. Conclusion:

This article has traced the planning and development of secondary education in India through the principal national commissions and policies enacted since independence, from the University Education Commission of 1948-49 to the National Education Policy of 2020. The review demonstrates a clear historical continuity in the broad aims of secondary education policy, namely expanding access, improving quality, and promoting equity, alongside a marked evolution in the specificity and data-orientation of the planning instruments employed to pursue these aims. The persistence of documented rural-urban disparities in secondary school enrolment and infrastructure indicates that the effective development of secondary education in India continues to depend substantially on the strength of state- and district-level planning processes through which national policy is translated into local provision. Future research and policy attention would benefit from a closer, district-level examination of how these successive national policies are actually implemented, monitored, and experienced in specific rural contexts, in order to identify the gap, where one exists, between policy intention and local educational reality.

A THEMATIC OVERVIEW OF EMERGING OPPORTUNITIES IN ENABLING AI EQUITABLE AND INCLUSIVE EDUCATION

Mr. Midde Prabhakar

Research Scholar, Department of Education, and Education Technology, School of Social Science, University of Hyderabad

Dr. R. Kohila Devi

Assistant Professor, Department of Education and Education Technology, School of Social Sciences, University of Hyderabad

Abstract

Artificial Intelligence (AI) is becoming an important part of education. It is being used in many ways, such as personalized learning, AI-based tutoring, automated feedback, learning analytics, language translation, accessibility tools, and the creation of learning materials. These technologies can help teachers and students by making learning more flexible and responsive to individual needs. At the same time, the growing use of AI in education raises an important concern. While AI has the potential to make education more inclusive and accessible, it may also create new forms of inequality. Students who do not have reliable internet access, digital devices, or the skills needed to use AI may not receive the same benefits as others. There are also concerns related to language, disability, gender, social background, privacy, bias, and the unequal availability of technology.The paper synthesizes evidence and policy perspectives from international organizations and peer-reviewed research, with particular attention to UNESCO's (2024) guidance on generative AI, AI competency frameworks, the Global Education Monitoring Report (2023), UNICEF's (2025) child-centred AI guidance, OECD research on students with special educational needs, and contemporary systematic reviews of AI in education. The analysis identifies seven interrelated themes: AI as an Instrument for Equitable Access, personalized and adaptive learning, AI Accessibility and Learners with Disabilities, linguistic and cultural inclusion, AI literacy and learner agency, Algorithmic Bias and the Reproduction of Inequality. The review argues that AI should not be conceptualized as a substitute for teachers or as an autonomous solution to educational inequality. Instead, AI should function as an equity-enabling educational infrastructure embedded within inclusive pedagogy, qualified teacher judgement, universal design, ethical governance and meaningful human participation. The paper concludes that AI can contribute to Sustainable Development Goal 4 in order to enhance quality education only when there is availability of access, capability, participation, and safety education are addressed simultaneously.

Keywords: *Artificial Intelligence, Inclusive Education, Personalized Learning, Algorithmic Bias, Inequality*

Introduction

Education is fundamentally concerned with expanding human capabilities and ensuring that learners, regardless of socioeconomic background, disability, language, gender, geography or other circumstances, have meaningful opportunities to learn and participate. Sustainable Development Goal 4 (SDG 4) therefore places inclusive and equitable quality education at the centre of the global education agenda (United Nations, 2015). The emergence of Artificial

Intelligence (AI) introduces both significant opportunities and unprecedented challenges for achieving inclusive and equitable education. (UNESCO, 2021)

AI is increasingly embedded in educational technologies through adaptive learning platforms, automated assessment, intelligent tutoring systems, speech recognition, machine translation, predictive analytics and generative AI (Zawacki-Richter et al., 2019). AI can explain topics, prepare learning materials, give feedback, translate content, and support different ways of learning (Lin et al., 2023). However, its benefits depend on access to devices, internet, electricity, digital skills, and trained teachers (UNESCO, 2023). Students with better resources may gain more from AI, while disadvantaged learners may continue to face educational inequalities (UNESCO, 2023). UNESCO's AI competency frameworks further emphasize that students and teachers require knowledge, skills and values for responsible participation in AI-mediated educational environments (Miao et al., 2024). UNESCO's 2023 Global Education Monitoring Report warns that digital technology can help disadvantaged learners but can also reproduce or increase inequalities when access, governance and teacher capacity are inadequate (UNESCO, 2023). AI can make learning easier by giving students quick explanations, practice activities, feedback, and support in different languages (Lin et al., 2023). However, not all students have the same opportunities to use these tools. Lack of internet, devices, electricity, digital knowledge, or teacher support can limit their benefits. Therefore, AI should be used in a fair and inclusive way. (UNESCO, 2023)

Inclusive and Equitable Education in the AI Era

Inclusive education extends beyond physical access to schools. It involves removing barriers to participation, learning and achievement. Equity differs from simple equality because learners may require different resources and forms of support to achieve meaningful educational opportunities.

Within an AI-enabled education system, three dimensions of equity are particularly important:

Equity of access

Learners should have meaningful access to appropriate devices, connectivity, electricity, AI-enabled resources and technical support.

Equity of participation

Learners should possess the digital, AI and critical-literacy capabilities necessary to participate effectively rather than merely consume AI-generated content.

Equity of outcomes

AI systems should be designed and evaluated according to whether they actually improve learning opportunities and outcomes for disadvantaged groups rather than simply increasing technological adoption.

This distinction is essential because educational inequality can occur at several stages: access, use, quality of interaction, representation, decision-making and outcomes.UNICEF's recent child-centred AI guidance similarly emphasizes non-discrimination, inclusion, privacy, transparency, accountability, safety and meaningful participation of children in AI systems.

Objectives

1. To overview the potential of AI in promoting inclusive and equitable educational opportunities.

2. To identify major educational applications of AI that can support inclusive and equitable education.
3. To analyse the central paradox : AI Can Reduce and Reproduce Inequality
4. To review the potentiality of AI in enhancing equality in education.

Methodology

This paper adopts a thematic literature review. It does not include original experimental data. Instead, it examines and brings together information from research studies, review papers, policy documents, and educational reports. Relevant literature was searched through sources such as ERIC, Scopus, Web of Science, ScienceDirect, IEEE Xplore, UNESCO, UNICEF, OECD, OpenAlex, ResearchGate, and Google Scholar.

Findings

The reviewed studies were grouped according to common themes related to inclusion and equality. From the literature, the following main themes were identified:

Theme 1: AI as an Instrument for Equitable Access

AI can help students who have limited access to good educational resources (Miao et al., 2021). It can give explanations, feedback, practice activities, learning support, translations, text-to-speech and speech-to-text services. It can also create or change learning materials and provide help beyond normal classroom hours. (Miao et al., 2021; Lin et al., 2023) These benefits are useful in places facing teacher shortages, remote locations, or limited resources. However, AI alone cannot remove the digital divide. Proper infrastructure, internet access, devices, digital skills, language support, and trained teachers are necessary. (UNESCO, 2023) Therefore, schools must focus on accessibility, not only availability. AI should be viewed as an educational resource that benefits all learners, not only those with better resources. (Miao et al., 2021; UNESCO, 2023) However, AI cannot automatically overcome the digital divide. UNESCO's evidence emphasizes that educational technology requires appropriate infrastructure, governance and teacher preparation. The benefits of technology can remain concentrated among learners who already possess greater socioeconomic and technological advantages. (UNESCO, 2023) Therefore, an equity-oriented AI strategy must distinguish between AI availability and AI accessibility. (Miao et al., 2021; UNESCO, 2023)

Theme 2: Personalized and Adaptive Learning

Personalized learning is an important use of AI in education. AI tools can study students' answers and learning progress and suggest suitable lessons, activities, and feedback. (Miao et al., 2021; Lin et al., 2023) In a normal classroom, one teacher may have to teach many students who learn at different speeds and have different needs. It can be difficult to give each student individual attention. AI can provide extra support by finding areas where a learner is struggling and suggesting suitable learning materials or practice. (Lin et al., 2023) Research on AI in education highlights personalized learning, intelligent tutoring systems, and adaptive learning as useful ways to support students and respond to their individual learning needs. (Lin et al., 2023) Systematic reviews demonstrate that AI is being used across instructional, assessment and administrative functions. (Zawacki-Richter et al., 2019) However, personalization should not be confused with replacing the teacher. UNESCO's technology-in-education evidence stresses that technology should support human interaction rather than seek

to substitute it. (UNESCO, 2023) An AI system may recognize that a student repeatedly answers a mathematical problem incorrectly, but a teacher may understand that the underlying difficulty is anxiety, language comprehension, a misconception or a family circumstance.

Theme 3: AI Accessibility and Learners with Disabilities

AI has considerable potential to support inclusive education for learners with disabilities. Examples include: speech recognition for learners with motor difficulties, text-to-speech for learners with visual or reading difficulties, automatic captioning, image description, language simplification, adaptive interfaces, predictive text, personalized instructional materials, assistive communication technologies. (Linsenmayer, 2025; UNICEF, 2025) Recent OECD research specifically examines how AI can support students with special educational needs while emphasizing ethical design, research, monitoring, data protection, security and accountability. (Linsenmayer, 2025) UNICEF likewise identifies improved accessibility for children with disabilities as one potential benefit of AI. (UNICEF, 2025)

This aligns strongly with principles associated with Universal Design for Learning (UDL), where multiple means of engagement, representation and action/expression are used to reduce barriers to learning. (CAST, 2018; Loreman, 2017) Nevertheless, AI-generated accessibility features must themselves be accessible. Poor speech recognition for certain accents, inaccurate image descriptions or systems that do not understand assistive technologies can create new barriers.Therefore, accessibility must be evaluated by the learners who actually depend on these technologies. (Linsenmayer, 2025)

Theme 4: Linguistic and Cultural Inclusion

Language represents one of the most important dimensions of educational equity. AI-based translation, speech recognition and language-generation technologies can potentially expand access to educational content across languages. (Miao & Holmes, 2023) This is particularly significant in multilingual societies such as India. (UNESCO, 2023) AI can support: translation of educational resources, bilingual explanations, vocabulary development, language practice, speech-based learning, localized educational content, multilingual teacher support. (Miao & Holmes, 2023) However, linguistic AI can also reproduce language hierarchies. Major languages often receive substantially greater digital representation than minority, indigenous or regional languages. (UNESCO, 2023)

AI tools may work better in widely used languages because they have access to more training information. In contrast, they may give weaker or less suitable results in languages that have fewer digital resources. (Paul et al., 2025) This can create inequality among learners. (UNESCO, 2023) Therefore, simply translating educational content is not enough. (Miao & Holmes, 2023) Fair AI systems should also respect local languages, knowledge, traditions, cultural backgrounds, and different ways of expressing ideas. (UNESCO, 2023) Educational AI should be designed to understand the needs of diverse communities and represent their experiences properly. (Miao & Holmes, 2023) This approach can help learners feel included and ensure that technology supports different languages and cultures in education equally. (UNESCO, 2023)

Theme 6: AI Literacy and Learner Agency

AI literacy is becoming an important part of modern education. (Miao et al., 2024) UNESCO's AI Competency Framework for Students includes 12 competencies under four areas: human-centred thinking, AI ethics, AI techniques and applications, and AI system design. These skills develop through understanding, using, and creating with AI. Students should not only learn to use AI tools but also use them carefully and responsibly. (Miao et al., 2024) AI literacy means knowing basic AI ideas, understanding its limits, checking false or misleading information, evaluating sources, identifying bias, protecting personal data, and using AI ethically. Students should also report when AI is used, question AI decisions, and understand its effects on society and people. (Miao et al., 2024) This is particularly important for equity because learners from privileged backgrounds may receive AI literacy informally through families, private institutions and technology-rich environments. Schools therefore have an important responsibility to democratize AI literacy. (Miao et al., 2024; UNESCO, 2023)

Theme 7: Algorithmic Bias and the Reproduction of Inequality

AI systems learn from data. If historical data contain social inequalities, the resulting algorithms can reproduce them. In education, algorithmic bias may affect: student performance prediction, admission, dropout prediction, automated grading, recommendation systems, learner profiling, behavioral prediction, resource allocation. (Baker & Hawn, 2022; Idowu, 2024) A systematic review of education algorithms highlights fairness concerns across applications such as dropout prediction, performance prediction, classification and recommended systems. (Idowu, 2024) The problem is particularly serious when AI decisions are treated as objective simply because they are computational. An algorithm is not automatically neutral. Data-driven does not necessarily mean bias-free. AI systems should therefore undergo regular audits for: demographic bias, linguistic bias, disability-related bias, socioeconomic bias, gender bias, cultural bias, differential accuracy. (Baker & Hawn, 2022; Idowu, 2024) Students and teachers should also have mechanisms for questioning AI-supported decisions. (Idowu, 2024; OECD, 2023)

The Central Paradox: AI Can Reduce and Reproduce Inequality

AI can reduce inequality when it:

- Expands access to quality learning resources
- Supports learners with disabilities
- Enables personalized learning
- Supports multilingual education
- Provides additional feedback
- Assists teachers
- Makes educational content more accessible.

AI can reproduce inequality when it:

- Requires expensive devices
- Depends on high-speed connectivity
- Performs poorly for minority languages
- Contains biased training data

- Profiles disadvantaged learners inaccurately
- Collects excessive personal data
- Excludes communities from AI design
- Replaces human interaction
- Assumes that all learners possess equal AI literacy.

Special Significance for India

The issue has particular relevance for India because of its linguistic diversity, large student population, socioeconomic variation, rural-urban differences and expanding digital education ecosystem. India's National Education Policy 2020 has explicitly recognized the relevance of emerging technologies, including AI, and government implementation materials document AI-related learning initiatives at school level. However, equitable AI implementation in India requires attention to rural connectivity, affordability of devices, electricity availability, regional languages, teacher digital competence, disability accessibility, gender-related digital disparities, socioeconomic differences, data protection, culturally relevant educational content.

The Indian context therefore offers an important opportunity to develop low-cost, multilingual, accessible and community-responsive AI models for education rather than simply importing technology developed for high-resource environments. AI-enabled education in India should consequently be aligned with constitutional values, educational inclusion, multilingualism, social justice and the broader objectives of NEP 2020.

Discussion

The central finding of this thematic review is that AI is neither inherently equitable nor inherently inequitable. Its educational consequences depend upon the conditions surrounding its implementation. The same technology may produce very different outcomes for different learners. A generative AI tutor may provide valuable individualized assistance to one learner while providing inaccurate or culturally inappropriate information to another. An automated assessment system may identify students requiring additional support but may also reproduce historical bias if its training data are unrepresentative.

Consequently, technological innovation must be accompanied by educational judgement. This finding is consistent with the broader evidence base. UNESCO states that technology in education should serve learners and educational goals, rather than being adopted simply because it is new. Research also shows that AI can improve access, but it needs careful planning, ethical use, safety, strong research, and accountability. AI should adjust to learners' different needs, languages, abilities, and backgrounds instead of expecting learners to adjust to the technology. Thus, the future of inclusive AI in education should be guided by a simple principle: Technology should adapt to educational diversity, not force educational diversity to adapt to technology.

Conclusion

AI is changing education by supporting personalized learning, quick feedback, accessibility, translation, teachers, and wider access to learning resources. However, it can also increase inequality because of unequal access, biased systems, language barriers, privacy concerns, and limited teacher preparation. AI should support, not replace, teachers and learners. To achieve SDG 4, education systems must use AI fairly and responsibly so every learner can learn,

participate, succeed, and make choices. The success of AI should not be measured only by its advanced technology, but by how well it improves learning opportunities for students who have often been left behind.

ARTIFICIAL INTELLIGENCE: RETHINKING TRANSFORMATIVE TEACHING AND LEARNING FOR SUSTAINABLE EDUCATION

Ms. Elora Suman Sahoo
Research Scholar, Department of Education and Education Technology,
University of Hyderabad Hyderabad, Telangana, India

Abstract

Artificial Intelligence brings a paradigm shift and personalized learning support through education, and personalised learning support. Sustainable development education has the capacity to realise the learners and respond based on social complex economic, and environmental challenges. Integrating AI with sustainable education offers an opportunity to reconsider how teaching learning can support and enhance quality education for sustainable development, of AI and ESD, therefore, offers an opportunity to reconsider how teaching and learning can support sustainable development. This thematic paper reflected recent literature to examine the potential of AI in advancing transformative and sustainability-oriented education. The reviewed information explores six important themes, such as: quality and personalised education; inclusion and equity; sustainability competencies; transformative pedagogy; teacher -AI literacy and professional competence; and the ethical, social and environmental challenges of AI. The reviewed reports indicated that AI can enhance learner support, accessibility, inquiry, critical engagement and problem-solving when embedded within appropriate pedagogical and institutional contexts. However, unequal digital access, algorithmic bias, privacy concerns, academic integrity concerns, limited teacher preparedness, and AI's environmental footprint may limit the usage of AI in the field of the teaching-learning process. The paper consequently advances the idea of AI-sustainable education, in which technological innovation is aligned with human agency, educational equity, transformative pedagogy, sustainability competencies and responsible governance to support meaningful and responsible educational transformation.

Keywords: *Artificial Intelligence, AI Literacy, Transformative Pedagogy, Sustainable Education*

1. Introduction

AI, along with specialised technological innovation, increases only influence on everyday teaching and learning practices. Adaptive learning systems, intelligent tutoring, learning analytics, automated feedback and generative AI are changing how students access information and interact with learning materials. These developments have created opportunities for more individualised and responsive educational experiences, while also raising fundamental questions about the changing roles of teachers and learners (Alkhawaja et al., 2025; Kim, 2025; Lin et al., 2023). Recent reviews similarly show that personalisation, sustainable learning, and AI literacy have become prominent areas in contemporary AI-in-education research (Abulibdeh, 2025; Bagherimajd & Khajedad, 2025). The educational significance of AI is especially evident when considered alongside the Sustainable Development Goals (SDGs). Education plays a central role in sustainable development because it fosters the knowledge, values, and competencies that enable individuals to understand and respond to complex societal challenges.

Integrating AI in the teaching learning process will enhance sustainable development however, there may be some challenges faced by the teachers and students in their pedagogical context the challenges such as: unequal digital access, algorithmic bias, privacy concerns, academic integrity concerns, limited teacher preparedness, and AI's environmental footprint will hinder the teaching and learning process. Within education, this distinction is especially important. AI can provide a student with an answer, but sustainable education requires the learner to understand a problem, question assumptions, consider alternatives and make responsible decisions(Mensah, 2019). According to (Alkhawaja et al., 2025; Osman & Bashir, 2026) researcher revealed that AI-supported sustainability education further explained the importance of pedagogical design, AI literacy and meaningful student engagement in the teaching-learning process. The present thematic paper, therefore, examines the intersection of Artificial Intelligence, transformative teaching and learning, and sustainable development, rather than treating AI as an end in itself, the paper considers how it can be integrated into educational processes that develop sustainability competencies while preserving human agency and addressing ethical and social concerns.

2. Review of Literature

Artificial Intelligence has increasingly become part of educational practice through adaptive learning, intelligent tutoring systems, learning analytics, automated feedback and generative AI. Its educational applications have largely been associated with personalisation, learner support, assessment and improved access to educational resources. (Feng & Carolus, 2026; Lin et al., 2023)In their systematic review of intelligent tutoring systems, they demonstrate how AI-supported systems can address individual learning needs and foster more flexible learning environments. Similar possibilities have been identified in recent reviews of AI and sustainable education, particularly regarding personalised learning, accessibility, and AI-supported educational decision-making. (Toha, 2026). The connection between AI and sustainable development has also received increasing attention. Research on higher education indicates that AI may contribute to SDG 4 through personalised learning, adaptive instruction and improved learner support, while its applications may also help reduce educational inequalities (Apata et al., 2026a; Leal Filho et al., 2024). Students' perceptions similarly suggest that AI can assist with self-directed learning, problem-solving, and digital literacy, although concerns regarding dependence, accuracy, and ethical use remain. (Alkhawaja et al., 2025). Another important strand of literature concerns AI literacy and sustainability competencies. (Alamäki et al., 2024) demonstrate that students' understanding of AI and sustainable development needs to develop together if AI is to be used meaningfully for sustainability. Research on AI-supported sustainability learning further indicates that interactive simulations, personalised instruction and inquiry-oriented activities can help learners engage with complex sustainability issues. At the same time, researchers have highlighted the limitations and risks associated with AI. Unequal technological access can reproduce educational inequalities, while concerns about privacy, algorithmic bias, academic integrity, and inadequate teacher preparation complicate its implementation. (Apata et al., 2026a). Broader sustainability research also highlights the energy and resource requirements of AI systems. (Kar et al., 2022; Nishant et al., 2020).

Taken together, the literature shows considerable interest in AI as a contributor to sustainable education, but the relationship remains fragmented across technological, pedagogical, competency-based and ethical perspectives. The present paper brings these strands together by examining how AI can support transformative teaching and learning for sustainable development, while also considering the conditions under which such integration can remain equitable and responsible.

3. Conceptual Framework

The conceptual framework of the present paper is built around the relationship between AI capabilities, pedagogical transformation, sustainability competencies and sustainable educational outcomes. The framework begins from the premise that technological capability by itself does not produce sustainable development. Rather, AI needs to be translated into meaningful educational experiences through appropriate pedagogy. The first component of the framework is AI capability, which includes adaptive learning, intelligent tutoring, learning analytics, generative AI and assistive technologies. These capabilities create possibilities for personalisation, accessibility, feedback and inquiry for learners. The second component is transformative pedagogical integration, through which AI is incorporated into inquiry-based, problem-based, project-based, collaborative and experiential learning for teachers. The third component concerns sustainability competencies, including critical thinking, system thinking, problem-solving, collaboration, future-oriented thinking and ethical decision-making for educational stakeholders. These competencies can contribute to educational outcomes associated with quality, inclusion, equity and learner agency and, ultimately, to wider education sustainable development. Importantly, the above framework is not linear or automatic. Its effectiveness is conditioned by teacher AI competence, student AI literacy, infrastructure, equitable access, ethical governance, data protection and human agency. According to (Toha, 2026) integrating AI with higher education emphasises the potential of the learners in getting sustainable education.

4. Theoretical Framework

The paper draws primarily on Transformative Learning Theory and Sustainability Education Theory, while also incorporating ideas from constructivist approaches to learning. Transformative Learning Theory is relevant because sustainable development requires learners to examine established assumptions and develop new ways of understanding complex social and environmental problems. AI can contribute to this process when used to facilitate inquiry, scenario analysis, reflection, and problem-solving rather than simply supplying ready-made answers in pedagogical contexts. Sustainability Education Theory provides the framework for a broader educational purpose. It views education as a means of developing the knowledge, values, and competencies necessary to respond to sustainability challenges. (Apata et al., 2026a; Tarrant & Thiele, 2016) Similarly, use sustainability education theory to examine how AI can support critical thinking, agency, systems-level awareness and sustainability-related educational outcomes. The constructivist perspective complements these theories by viewing learners as active participants in knowledge construction. (Toha, 2026) argues that AI can serve as a cognitive scaffold for personalised, inquiry-driven, and reflective learning. Thus, AI becomes educationally transformative when learners actively use it to question, investigate,

interpret, and construct knowledge.

5. Objectives

1. To examine the contribution of AI-supported for sustainable education.
2. To identify the opportunities that AI can facilitate transformative teaching and learning.
3. To explore the major pedagogical, ethical, social and environmental challenges associated with AI-enabled sustainable education.

6. Methodology

The paper follows a thematic literature review approach. The analysis draws primarily on the scholarly articles provided for the study. It focuses particularly on literature addressing AI in education, sustainable education, Education for Sustainable Development, sustainability competencies and higher education.

The literature was examined by identifying recurring concepts and relationships across the selected studies. Particular attention was given to research on the educational applications of AI and its literacy, pedagogical and learning outcomes, accessibility, sustainability competencies, teacher preparedness, and ethical concerns. The relevant literature for the present study was collected from scholarly databases, including Scopus, Taylor & Francis, Eric, Web of Science and Google Scholar.

7. Findings: Major Themes

7.1 AI for Quality and Personalised Education

The literature consistently identifies personalised learning as one of the most important educational possibilities associated with AI. Adaptive systems and intelligent tutoring can respond to differences in learners' pace, performance and support requirements (AlSagri & Sohail, 2024). AI-based analytics may also help institutions to identify students' experiences regarding academic difficulties and facilitate earlier interventions in their personalised learning process. The significance of personalisation extends beyond convenience. When students receive learning experiences that respond more closely to their needs, educational support can become more flexible and learner-centred. However, personalisation should not result in excessive dependence on automated systems. Meaningful learning still requires teacher judgement, student participation and opportunities for independent reasoning.

7.2 AI for Inclusion and Educational Equity

The second theme concerns the potential of AI to widen participation in education. Multilingual tools, speech-to-text systems, adaptive interfaces and other assistive technologies may help learners who encounter linguistic or accessibility barriers. AI-supported distance learning can also extend educational opportunities to geographically underserved students. (AlSagri & Sohail, 2024; Osman & Bashir, 2026) At the same time, unequal access to digital infrastructure creates a significant contradiction. Learners without reliable connectivity, appropriate devices, or sufficient AI literacy may benefit less from AI-enabled education. Thus, AI may become a mechanism for reducing inequality only when questions of access and affordability are addressed.

7.3 AI and Sustainability Competencies

The third theme focuses on competencies needed for sustainable development. AI-supported

learning environments can provide opportunities for learners to investigate complex problems, compare alternatives and examine possible future outcomes. However, the literature also warns against replacing students' thinking with automated responses (Alkhawaja et al., 2025; Su et al., 2026). Concerns that excessive reliance on AI may negatively affect problem-solving, while other studies suggest that AI can support self-directed learning and digital literacy to enhance sustainability competencies among teachers and students. The value of AI, therefore, depends upon whether learners use it as a resource for thinking or as a substitute.

7.4 AI and Transformative Pedagogy

The fourth theme concerns the pedagogical use of AI. AI has greater transformative potential when it is embedded in inquiry-based, problem-based, project-based and experiential learning. In such learning environments, students can investigate authentic sustainability problems, analyse information, compare possible solutions and reflect on their implications.

(Niri et al., 2026; Osman & Bashir, 2026) Provide an example of this orientation through their proposed AI-supported model, which incorporates project-based learning, cross-cultural collaboration, scenario-based learning, and SDG awareness. Thus, it is suggested that AI can facilitate learning experience and make the teacher and student rethink transformative pedagogy that moves beyond information acquisition towards collaboration, reflection and responsible participation.

7.5 Teacher AI Literacy and Professional Competence

The fifth theme highlights the importance of teachers. AI adoption cannot be sustained simply by providing access to technology. Teachers need to understand the capabilities and limitations of AI, evaluate its outputs and determine when its use is appropriate for education (Deshen et al., 2026). Teacher competence, therefore, includes technical knowledge, pedagogical judgement, critical evaluation and ethical awareness in their pedagogical context. Recent research(AlSagri & Sohail, 2024; Kar et al., 2022; Ng et al., 2021) Recommended comprehensive educator training that covers the pedagogical, technical, and ethical dimensions of AI.

7.6 Ethical, Social and Environmental Challenges

The final theme concerns the conditions that may limit AI's contribution to sustainability. Privacy, algorithmic bias and academic integrity remain major issues and concerns. AI-generated information may also be inaccurate, while dependence on automated systems can affect students' independent thinking.

Infrastructure and implementation costs represent another challenge. The literature noted that (Nishant et al., 2020) computational resources, software and institutional investment may remain inaccessible in resource-constrained settings. Finally, AI's own environmental resource requirements raise a broader sustainability question: education cannot claim to use AI sustainably without considering the technology's ecological consequences(AlSagri & Sohail, 2024; Apata et al., 2026b).

8. Educational Implications

The findings suggest that AI integration requires a shift in the role of the teacher from information provider towards learning designer, facilitator and critical mediator. For students, AI literacy should involve more than learning how to operate technological tools. Learners

need to evaluate AI outputs, recognise potential bias, verify information, and understand the consequences of irresponsible usage of AI. Integrating AI literacy within sustainability-oriented curricula can help students develop responsible digital citizenship. Educational institutions also need clear policies concerning privacy, academic integrity, accessibility and responsible AI use. Infrastructure investment must be accompanied by teacher preparation so that the availability of technology translates into meaningful educational practice. These priorities are also reflected in recent literature here cite emphasising institutional investment, educator training and responsible governance.

9. Discussion

AI does not automatically make education sustainable, its contribution depends upon how technological capabilities are translated into educational experiences with the help of teacher and student. The first important insight is that AI can improve personalisation, accessibility, and learner support, but these benefits are meaningful only when they strengthen, rather than replace, human learning. The second is that AI presents a dual possibility for equity. It can reduce barriers through accessibility and personalised support, yet an infrastructural divide can create another layer of educational disadvantage. The third insight concerns pedagogy. AI has limited transformative value when used solely to generate content or answers. Its stronger contribution emerges when embedded in learning processes that require inquiry, critical reflection, collaboration, and problem-solving. This makes pedagogy the bridge between AI capability and sustainable education.The fourth insight is the continuing importance of teachers, AI increases the need of educators who can make informed pedagogical and ethical decisions. On this basis, the paper proposes AI-sustainable education. This goes beyond the idea of AI-enabled education by asking whether technological integration supports educational quality, equity, human agency, sustainability competencies, ethical responsibility and long-term social and environmental well-being.

10. Conclusion

AI is creating new possibilities for educational personalisation, accessibility, learner support and rethinking for transformative learning. Its potential contribution to sustainable development is particularly significant when it is connected with sustainability competencies and learner-centred pedagogies. However, these possibilities are connected with issues regarding inequality, privacy, bias, academic integrity, teacher preparedness and the environmental implications of AI. The paper therefore conclude that AI-sustainable approach places technological innovation within the broader purposes of education in developing learners capabilities, critical thinking, ethical awareness and socially responsible to face the sustainability challenges. Thus, AI should remain rethinking educational transformation in promoting sustainable development in education.

ARTIFICIAL INTELLIGENCE FOR SUSTAINABLE DEVELOPMENT IN EDUCATION: A LITERATURE REVIEW

Dr Thimmaraju T
Guest Faculty, Department of Education, Bangalore University, Bangalore, Karnataka, E-mail: thimmarajuphd@gmail.com
Dr Naveen kumar L.C
Guest Faculty, Department of Education, Bangalore University, Bangalore, Karnataka, E-mail: naveen3507phd@gmail.com

Abstract

Artificial Intelligence (AI) has emerged as an important technological development with the potential to transform education and contribute to sustainable development. The integration of AI into education can support personalized learning, improve accessibility, assist teachers, enhance educational administration, identify students at risk of dropping out, and facilitate data-informed decision-making. These possibilities are particularly relevant to Sustainable Development Goal 4 (SDG 4), which calls for inclusive and equitable quality education and lifelong learning opportunities for all. At the same time, AI creates significant challenges related to digital inequality, data privacy, algorithmic bias, academic integrity, teacher preparedness, environmental costs and the changing nature of teaching and learning. This literature review examines the role of artificial intelligence in promoting sustainable development in education, with particular attention to educational quality, equity, inclusion, teacher development, resource efficiency and lifelong learning. Recent systematic reviews indicate that AI research in education is expanding rapidly, while research specifically connecting AI with sustainability remains comparatively developing. The review argues that AI can contribute meaningfully to sustainable education only when its implementation is human-centred, ethical, inclusive and pedagogically appropriate. The paper concludes that educational institutions should develop AI literacy among teachers and students, establish responsible AI policies, strengthen digital infrastructure, protect learner data and ensure that technological innovation supports rather than replaces human educational relationships.

Keywords: *Artificial Intelligence, Sustainable Development, Education, Digital Learning, AI Literacy*

Back ground of the study:

Education is one of the most important foundations of sustainable development. It contributes not only to individual knowledge and skills but also to social inclusion, economic development, environmental awareness, innovation and responsible citizenship. The United Nations Sustainable Development Goal 4 seeks to "ensure inclusive and equitable quality education and promote lifelong learning opportunities for all." UNESCO emphasizes that education is essential for achieving the wider set of Sustainable Development Goals (SDGs).

At the same time, Artificial Intelligence (AI) is rapidly changing educational practices. AI includes technologies such as machine learning, natural language processing, intelligent tutoring systems, learning analytics, automated assessment and generative AI. Recent research shows that AI in education has become a substantial research field, with studies examining applications, pedagogical approaches, research methods and the implications of AI for

teachers and learners. The emergence of generative AI tools has accelerated this transformation. Students can use AI systems for explanations, brainstorming, language support and personalized learning, while teachers can use them for lesson planning, assessment support, content creation and differentiated instruction. However, the rapid development of AI has also created concerns about privacy, bias, misinformation, academic integrity and unequal access. UNESCO therefore advocates a human-centred approach in which AI is used in ways that are ethical, safe, equitable and meaningful. The relationship between AI and sustainable development in education is consequently complex. AI can contribute to sustainability by improving educational access, quality and resource management, but the technology itself can also create new social, ethical and environmental challenges. Sustainable AI in education therefore requires more than simply introducing new technologies into classrooms. It requires consideration of educational purposes, social justice, environmental responsibility, teacher professionalism and the long-term interests of learners.

Major Benefits of AI for Sustainable Education

The literature indicates several potential benefits.

Personalized and learner-centred education: AI can adapt learning resources to individual needs and provide rapid feedback.

Increased accessibility: AI-based translation and assistive technologies can help learners overcome linguistic and accessibility barriers**.**

Improved teacher efficiency: Automation of routine tasks can potentially reduce administrative workloads and allow teachers to spend more time on teaching and learner interaction.

Data-informed decision-making: AI can identify patterns in educational data that may assist teachers and administrators.

Support for lifelong learning: AI-enabled learning platforms can provide flexible learning opportunities beyond conventional educational settings.

Innovation in pedagogy: Generative AI and intelligent learning technologies can encourage new approaches to curriculum design, assessment and collaborative learning**.**

Objectives of the study:

- To examine the concept and applications of Artificial Intelligence in education.
- To analyze the relationship between AI and sustainable development in education.

Literature Review:

Nuankaew, Nasa-Ngium & Nuankaew (2025) Artificial *Intelligence and Educational Data Mining Technologies for the 4th SDG Quality Education: A Systematic* ***Review.*** **This** systematic review examined research published from **2020–2024**. From 366 initially identified studies, 19 were included in the detailed review. The study found that AI can contribute to SDG 4 through **personalized learning, inclusive education, accessibility, predictive analytics, virtual classrooms and educational data mining**. It also identified algorithmic bias and data privacy as major concerns. This is one of the most directly relevant studies because it explicitly connects AI applications with **SDG 4**.

Apata et al. (2025) *Artificial Intelligence in Higher Education: A Systematic Review of Contributions to SDG 4 (Quality Education) and SDG 10 (Reduced Inequality)*The researchers

conducted a systematic literature review using several academic databases. From 1,673 records, **51 empirical studies** were retained. The review found that AI can support more **student-centred, personalized, accessible and equitable education**. Remote learning technologies and AI-supported educational systems were identified as mechanisms that can improve access and flexibility. Particularly useful for discussing the relationship between AI, **quality education and educational inequality**.

Toha (2025) *Artificial Intelligence, Sustainability and Higher Education: A Systematic Literature Review Toward Sustainable Higher Education (SHE) Framework.*Toha reviewed literature from 2015–2024 using the PRISMA framework and databases including Scopus and Web of Science. The study investigates the intersection of AI, sustainability and higher education and proposes a conceptual framework for AI-driven sustainable higher education. : This study is valuable for developing a theoretical framework linking AI with sustainable higher education, rather than looking at AI merely as an educational technology.

AlSagri & Sohail (2024) *Evaluating the Role of Artificial Intelligence in Sustainable Development Goals with an Emphasis on "Quality Education* ."This research specifically examines how AI can contribute to the Sustainable Development Goals, with particular emphasis on quality education. The researcher discusses the potential of AI and generative AI technologies to address educational challenges within the SDG framework.

Sustainable Social Development through AI and Data Science in Education (2023) *Sustainable Social Development through the Use of Artificial Intelligence and Data Science in Education during the COVID Emergency: A Systematic Review Using PRISM* This systematic review examined the use of AI, big data and learning analytics in education during the COVID-19 period. It found that these technologies can support personalized education, prediction of learning outcomes and identification of students at risk of dropping out. Very useful for discussing AI's contribution to educational continuity, student retention and personalized learning.

Research Methodology:

The study adopts a descriptive research design to explore the concepts, applications and benefits of Artificial Intelligence for Sustainable Development in Education. The approach is qualitative, utilizing content analysis to review existing literature on the topic. Key aspects of the methodology include.

Data Collection: Secondary data were sourced from peer-reviewed journal articles, academic publications and reputable online databases, studies published in 2003 to 2005 were prioritized to ensure relevance and recency.

Analysis Process: A content analysis framework was employed to identify recurring themes, insights, and trends in the reviewed literature. The data were categorized into thematic areas such concepts, applications and benefits.

Scope of the study: The research focuses on Artificial Intelligence for Sustainable Development in Education used in diverse contexts, including higher education. Both qualitative and quantitative aspects of previous studies were examined to provide a holistic understanding.

Limitations: As the study relies on secondary data, findings are interpretative and dependent

on the quality of reviewed literature. The absence of primary data collection limits the scope for contextual insights.

Findings of the study: From the literature review it can be analyzed that:

- AI can contribute to SDG 4 through **personalized learning, inclusive education, accessibility, predictive analytics, virtual classrooms and educational data mining**.
- AI can support more **student-centred, personalized, accessible and equitable education**. Remote learning technologies and AI-supported educational systems were identified as mechanisms that can improve access and flexibility.
- **Sustainability and higher education** and proposes a conceptual framework for AI-driven sustainable higher education
- AI is valuable for developing a theoretical framework linking AI with **sustainable higher education**, rather than looking at AI merely as an educational technology
- The potential of AI and generative AI technologies to address educational challenges within the SDG framework
- These technologies can support personalized education, prediction of learning outcomes and identification of students at risk of dropping out. Very useful for discussing AI's contribution to educational continuity, student retention and personalized learning.

Conclusions & Suggestions:

The literature suggests that AI can become an important instrument for sustainable educational development, but its contribution depends on how it is designed, implemented and governed. The strongest argument for AI in sustainable education is its potential to improve personalization, accessibility, resource allocation and lifelong learning. These functions directly relate to SDG 4 and, indirectly, to other SDGs. However, sustainability should not be equated with technological advancement. A technologically advanced education system is not necessarily sustainable if it increases inequality, compromises privacy, weakens teacher autonomy or generates excessive environmental costs. Consequently, the appropriate question is not whether education should adopt AI, but **how AI can be implemented in ways that strengthen educational quality, equity, human agency and long-term sustainability. A** sustainable model of AI in education should therefore combine technological innovation with teacher professionalism, ethical governance, inclusive infrastructure and sustainability education. Artificial Intelligence has considerable potential to contribute to sustainable development in education. Through personalized learning, intelligent tutoring, accessibility technologies, learning analytics, teacher support and institutional resource optimization, AI can contribute to the achievement of SDG 4 and support broader educational and social objectives. Nevertheless, AI also introduces substantial challenges. Digital inequality, privacy concerns, algorithmic bias, misinformation, academic integrity, teacher preparedness and environmental impacts require careful consideration. The literature increasingly supports a **human-centred model of AI in education.** UNESCO's guidance emphasizes that AI should **b**e used ethically, safely, equitably and in ways that are pedagogically meaningful. Therefore, the sustainable integration of AI requires more than investment in technology. It requires investment in teachers, students, digital infrastructure, ethical governance and research. AI

should ultimately function as a tool for strengthening human learning and educational opportunity rather than replacing the human purposes of education.

Recommendations

Based on the literature, the following recommendations are proposed:

1. **Develop AI literacy programmes** for teachers, students and educational administrators.
2. **Integrate AI literacy into teacher education** and continuing professional development.
3. **Establish institutional AI policies** addressing privacy, academic integrity, transparency and responsible use.
4. **Ensure equitable access** to digital infrastructure and AI-supported learning.
5. **Use AI as a complement to teachers**, not as a replacement for human educational relationships.
6. **Redesign assessment practices** to emphasize critical thinking, creativity, problem-solving and authentic learning.
7. **Strengthen data protection mechanisms** for learners and teachers.
8. **Evaluate AI systems for bias and fairness** before large-scale implementation.
9. **Promote environmentally responsible AI**, considering energy consumption and technological life cycles.
10. **Conduct longitudinal research** to evaluate the long-term educational and sustainability outcomes of AI.

ARTIFICIAL INTELLIGENCE AS A CATALYST FOR INCLUSIVE AND EQUITABLE EDUCATION: OPPORTUNITIES, CHALLENGES, AND PATHWAYS FOR ALL LEARNERS

Mr. Stany Pinto
Ph.D. Research scholar, St Ann's College of Education (Autonomous) Mangaluru, Karnataka, India.
Dr Dorothy Dsouza
Assistant Professor, St Ann's College of Education (Autonomous) Mangaluru, Karnataka, India.

Abstract

Artificial intelligence (AI) is rapidly transforming education, and its capacity to advance inclusive and equitable learning has become a central theme in contemporary scholarship. This thematic paper synthesizes recent literature to examine how AI can support learners with diverse needs, including those with disabilities, and the conditions under which it risks deepening existing inequalities. The review finds that AI-driven personalization, assistive technologies, and teacher-support tools offer genuine opportunities to expand access, participation, and outcomes. However, algorithmic bias, the digital divide, privacy concerns, and uneven teacher readiness threaten to entrench exclusion. The paper argues that AI is not inherently inclusive; its impact depends on human-centered design, inclusive data practices, robust governance, teacher preparation, and deliberate investment in infrastructure, and it concludes with pathways for realizing AI as an equity-first project in education.

Keywords: Artificial intelligence; Inclusive education; Educational equity; Assistive technology; Universal Design for Learning; Algorithmic bias; Digital divide

1. Introduction

Inclusive and equitable education is a global commitment enshrined in Sustainable Development Goal 4 and reaffirmed in international frameworks such as the Salamanca Statement-1994 and the Convention on the Rights of Persons with Disabilities-2006. Sustainable Development Goal 4 explicitly links inclusion with equity, calling for inclusive and equitable quality education and lifelong learning for all (Yang, 2025). Yet decades of research document a persistent gap between policy rhetoric and classroom reality, marked by teacher unpreparedness, resource shortages, infrastructural deficits, and attitudinal barriers that the broader inclusive-education literature has repeatedly identified (Graham et al., 2020).

Into this landscape has arrived artificial intelligence, a technology that is transforming how education is designed, delivered, and experienced. AI now underpins adaptive learning platforms, intelligent tutoring systems, automated assessment, learning analytics, and a growing array of assistive technologies. Proponents argue that AI can personalize instruction at scale, reduce teacher workload, and open access for learners who have historically been excluded (Roshanaei et al., 2023; Zhang, 2024). Critics caution that the same technologies can encode bias, widen the digital divide, and displace the human relationships at the heart of

inclusive pedagogy (Kizilcec & Lee, 2022; Yadav, 2024).

This thematic paper examines whether AI can serve as a genuine catalyst for inclusive and equitable education. It synthesizes recent literature to map the conceptual foundations, current applications, opportunities, and risks of AI in education, and it proposes pathways for realizing AI as an equity-first, human-centered project. The central argument is that AI is not inherently inclusive; its outcomes are decided by design choices, data practices, governance, and the contexts in which it is deployed.

The studies underpinning this paper span bibliometric analyses, systematic and narrative reviews, conceptual papers, and a small number of empirical case studies, and together they show a field that is expanding rapidly but still lacks strong implementation evidence. The central argument, therefore, is that AI should not yet be treated as a proven solution for inclusive and equitable education: the evidence base is strongest on potential and risk, but much weaker on durable, equitable impact under real classroom conditions

2. Understanding Inclusive and Equitable Education

Inclusive education is grounded in the principle that all learners, including those with disabilities and marginalized identities, should participate meaningfully in mainstream educational settings. Equity, in this framing, is distinct from equality: it demands fairness of access, participation, and outcomes rather than identical treatment. The historical trajectory of special education has moved from segregation toward integration and, more recently, toward genuine inclusion, a shift reflected in policy frameworks worldwide (Singh, S. 2024).

Universal Design for Learning (UDL) has emerged as a leading framework for operationalizing this vision, organizing instruction around multiple means of representation, expression, and engagement so that curricula are accessible by design rather than through retrofitted accommodation (Mary, 2023; Spencer, 2011). UDL aligns closely with the affordances of technology, which can deliver content in multiple modalities and offer learners flexible pathways to demonstrate understanding (Spencer, 2011). Technology-supported UDL is increasingly recognized as a route to inclusive and equitable classrooms, though its success depends on pedagogical design and institutional context (Mary, 2023).

Despite these advances, implementation remains uneven. Schools struggle with inadequate infrastructure, shortages of trained educators, rigid curricula, and weak support systems, while teachers often report positive attitudes toward inclusion but low confidence in their capacity to enact it (Pranyoto, Y. H., & Berangka, D. 2025). These persistent barriers form the benchmark against which AI's contribution to inclusive education must be assessed: a technology that merely automates exclusion is no advance at all.

3. Artificial Intelligence in Education: An Overview

Artificial intelligence in education encompasses a family of technologies, including machine learning, natural language processing, computer vision, and generative models, applied to learning and teaching. Current applications include adaptive and personalized learning systems that adjust content, pace, and feedback in real time (Akavova et al., 2023; Xaveria et al., 2025), intelligent tutoring systems that emulate one-to-one instruction, automated assessment and grading, learning analytics that identify at-risk learners, and assistive technologies such as speech-to-text, text-to-speech, and screen readers (Ahmed et al., 2025).

The appeal of AI for educators lies in its capacity for scale and personalization. Adaptive systems can continuously monitor learner performance and tailor instruction to individual needs, a task impossible for a single teacher in a large classroom (Akavova et al., 2023). Systematic reviews of adaptive learning confirm gains in engagement and outcomes, while also noting persistent challenges around interpretability, privacy, and scalability in low-resource settings (Xaveria et al., 2025). Reviews of AI in education similarly emphasize both the promise of personalized, accessible learning and the risks of socio-economic disparities in access (Zhang, 2024).

Yet deployment remains uneven. Most AI applications are concentrated in well-resourced, technology-rich environments, and their benefits do not automatically reach the learners who need them most. This unevenness is itself an equity concern that runs through the remainder of this paper.

4. Opportunities: How AI Can Advance Inclusion and Equity

The literature identifies four principal ways in which AI can advance inclusive and equitable education.

First, AI enables personalized learning for diverse needs. Adaptive platforms can tailor content, pacing, and feedback to individual learners, supporting students with varying abilities, learning styles, and preferences (Ahmed et al., 2025; Xaveria et al., 2025). Reviews of AI-powered assistive tools report improvements in academic engagement, independence, and social inclusion for students with learning disabilities, autism, and motor impairments (Koranteng, 2025). Personalized learning aligns closely with UDL principles, offering multiple pathways to representation, expression, and engagement (Mary, 2023).

Second, AI expands accessibility through assistive technology. Speech recognition, text-to-speech, automatic captioning, and language translation help learners with sensory, motor, and cognitive disabilities participate more fully (Ahmed et al., 2025; Rodríguez Torres et al., 2023). Integrative reviews of AI in higher education find that such tools improve accessibility, engagement, and academic performance for students with disabilities (Dumitru et al., 2025). Systematic reviews of AI-powered assistive technologies confirm significant enhancements in learning outcomes, accessibility, and personalized support for diverse learners (Cabanes & Galigao, 2025).

Third, AI supports teachers. AI can automate administrative tasks, generate progress reports, and provide real-time feedback, freeing educators to focus on pedagogical guidance and relational work (Akavova et al., 2023; López et al., 2025). Systematic reviews note that AI reduces the administrative burden on educators, enabling them to prioritize direct support for learners (López et al., 2025).

Fourth, AI can reach the unreached. AI-enabled platforms can deliver quality learning to remote, rural, and underserved populations, support multilingual learners, and identify learning difficulties early (Supramaniam et al., 2024; Zhang, 2024). In principle, AI can bridge geographic, economic, and social barriers that have historically limited access to quality education (Supramaniam et al., 2024).

5. Challenges and Risks

The same technologies that promise inclusion can also reproduce or amplify exclusion. Five

risks dominate the literature.

Algorithmic bias is the most widely documented concern. AI systems trained on unrepresentative data can encode and amplify societal inequalities, producing unfair predictions and recommendations that disadvantage marginalized learners (Kizilcec & Lee, 2022; Yin et al., 2024). Cultural underrepresentation, opaque decision-making, and weak governance undermine fairness in assessment, learning recommendations, and resource allocation (Hoca & Nuredin, 2025). Empirical work links perceived algorithmic bias directly to threats to educational equity, underscoring the need to address the black-box nature of educational AI (Farheen et al., 2025).

The digital divide is a second risk. AI depends on connectivity, devices, and electricity, precisely the resources that excluded learners often lack, and without deliberate intervention AI can widen rather than narrow educational inequalities (Juyal et al., 2025; Supramaniam et al., 2024; Zhang, 2024).

Privacy and surveillance constitute a third concern. Data-intensive systems raise questions about consent, ownership, and the monitoring of vulnerable children (Pawar & Khose, 2024; Zhang, 2024).

Teacher and institutional readiness is a fourth risk. Many educators lack training to use AI critically and effectively, and inadequate infrastructure limits implementation in underfunded schools (Juyal et al., 2025; López et al., 2025).

Finally, there is the risk of dehumanization. Over-reliance on automated systems can displace the human relationships central to inclusive pedagogy, and the preservation of human connection must be weighed against efficiency gains (Pawar & Khose, 2024; Yadav, 2024).

6. Pathways Forward

Realizing AI's potential for inclusive education requires deliberate action across five fronts.

Human-centered design should position AI as a complement to teachers, not a replacement, and participatory design that includes learners with disabilities in development and evaluation is essential (Holstein & Doroudi, 2022; Safdar et al., 2024). Inclusive data practices require representative datasets, transparency, and fairness audits to prevent bias from being encoded into systems (Hoca & Nuredin, 2025; Yin et al., 2024).

Robust policy and governance frameworks must establish accessibility standards, accountability mechanisms, and ethical guidelines for AI in education (López et al., 2025; Zhang, 2024). Teacher preparation should embed AI literacy and inclusive pedagogy in both pre-service and in-service training, since educator readiness is a precondition for equitable implementation (Cabanes & Galigao, 2025; López et al., 2025).

Finally, closing the digital divide requires sustained investment in infrastructure, connectivity, and affordable tools, alongside longitudinal research on equity outcomes (Juyal et al., 2025; Supramaniam et al., 2024). None of these pathways is sufficient alone; they must be pursued together.

7. Conclusion

Artificial intelligence offers a genuine opportunity to advance inclusive and equitable education. The literature demonstrates real gains in personalization, accessibility, teacher support, and reach, particularly for learners with disabilities and those in underserved contexts.

Yet AI is not inherently inclusive. Algorithmic bias, the digital divide, privacy risks, uneven teacher readiness, and the threat of dehumanization can all entrench the very exclusions inclusive education seeks to remove.

The evidence converges on a clear conclusion: the impact of AI on equity is decided by design choices, data practices, governance, and context, rather than by the technology itself. Pursuing AI as an equity-first, human-centered project, with participatory design, inclusive data, robust policy, teacher preparation, and investment in infrastructure, offers the most credible path toward education that is genuinely inclusive and equitable for all learners.

ANALYZING THE GLOBAL PERSPECTIVES ASPECTS OF THE EMPLOYABILITY SKILLS IN THE PRESENCE CURRICULUM OF POSTGRADUATE OF KUVEMPU UNIVERSITY

Dr. Shilpa. V
Faculty Member, Department of PG Studies and Research in Education, Kuvempu University, Jnana Sahyadri, Shankaraghatta, Shivamogga, Karnataka. India.
E Mail: shilpav03@gmail.com

Abstract

The higher education system in India is experiencing a transition phase from a conventional education system, or teacher-centred mode of instruction, to a progressive education system that is more student-centred and employment-oriented (UGC, 2012). The Choice Based Credit System (CBCS) was introduced by the University Grants Commission (UGC) in 2015 for graduate and postgraduate degrees and certificate programmes at the higher education level. Students can select multidisciplinary, intra-disciplinary, and skill-based courses based on the student's interests and goals (primary soft skill-oriented courses). Holistic development enables students to gain both hard and soft skills, increasing their employability and job prospects. But also India is currently facing a huge employability challenge with reference to graduate & Postgraduates students. Though unemployment is a challenge, the bigger issue is lack of employability skills in graduate students. Various studies and surveys conducted in this area reveal 70 to 75% of graduates are not employable. Skill development has therefore become an essential component of higher education. Universities and colleges are increasingly expected to integrate employability skills into their curricula through some aspects such as Academic Learning, Experiential Learning, Career Maturity, Professional Skills, Career Management, Meaningful Connections, and Global Perspective. The present study analyse the Employability Skills of aspects in the Global Perspective discipline of Arts, Science and Commerce postgraduate curricula of Kuvempu University.

Keywords: *Employability Skill, Global Perspectives, Higher Education, Postgraduates.*

Introduction:

The 21st century has witnessed a transmutation in the world of work, but not only in India, but in every country in the world. As the world of work undergoes an unprecedented transformation, countries are confronted with the challenge of an increasing mismatch between skills and jobs. Skills and the Future of Work (ILO 2018). Every organization needs every 7 M of Man, Money, Machine, Material, Method and Marketing, Measurement to be used in its daily operations. However, of all these resources, 'Man' (referring to manpower, employers, labour etc.) Therefore, the integration of employability into the program provides students with the opportunity to develop their skills, experience and knowledge to help them make a successful transition from education to employment. It is vital that all students have a certain level of employability activity built into their academic curriculum. According to the World Trade Organization, GDP could rise by 3 to 5 per cent in 2035 if India focuses on skills

development and training. But skills development alone is not sufficient to increase employability, as highlighted in the India Skills Report 2021. In Curriculum should give more requirement for more interaction between students and workplace. Through curriculum giving students the opportunity to explore their career interests, internships, hands-on experience, integrating industry-relevant skills, digital competencies, experiential learning, and career development into academic programmes higher education institutions can enhance graduate employability while contributing to national development and global competitiveness. Global perspectives learning is one of the aspects in the graduate employability curriculum.

Need and Importance of the Study:

The main role of higher education is to trained students by improving their knowledge, skills, attitudes and capacities to empower students as critical and reflective learners for life. In our country, the minimum qualification prescribed for many jobs even at the clerical level job is a University degree. The degree includes many skills, knowledge and capabilities for students entering a college and earning a degree with employability. But the large proportion of the products of the education system are found to lack employable skills. It has considerably reduced the credibility of the higher education system. The utility of higher education in assuring employment remains questionable. Many graduate and postgraduate students do not get jobs in their respective fields.

However, as most students continue their education, it is not easy for them to enter the labour market. For example, according to the estimates of the National Association of Software and Service Companies (NASSCOM), only 25 per cent of graduates are employable, and 75 per cent is not easily employable. Therefore, it is important to ensure equitable distribution and access to skills-development opportunities. There are several reasons for the lower level of employability in higher education, like system/ structural issues, inadequate practical and skill-based training, rapid technological changes, outdated teaching methods, unavailability of teachers, and infrastructure, outdated syllabus, absence of career counselling facilities, practical competencies, transferable skills, and industry-oriented experiences and so on. Hence, it creates a gap between higher education & employability. Therefore, recruiters today expect students to have some additional set of skills and Global perspectives curriculum required for employment known as employability skills. Changing education systems in the 21st century is an array of ways to develop employability through curricula. Good curriculum design will attract more interest in developing a number of skilful practices. So, the present study was undertaken to investigate the inducing aspects of employability in the postgraduate curriculum of Kuvempu University to explore the aspects of employability among postgraduate students. The identifying the opinions of postgraduate teachers & students about the Global perspectives employability aspects of presence PG curriculum.

Concept of Employability Skills:

Employability skills are necessary to obtain, maintain and succeed in a career.

The UK Commission for Employment and Skills (2009) defined, employability skills as “the skills almost everyone needs to do almost any job”. The Allen Consulting Group Report (2006) refers the employability skills by several other names, including key skills, core skills, life skills, generic skills, essential skills, key competencies, necessary skills and transferable

skills. Employability Skills refer to specific skills essential for employment.

Definition of Curriculum: According to Nation & Macalister (2010) define Curriculum as a guide in designing courses that consist of outer cycle namely Principles, Environment, and needs that involve practical and theoretical considerations that will have a major effect in guiding the actual process of course production.

Dimensions of Employability Curriculum: Employability Curriculum is based on seven dimensions of employability: Academic Learning, Experiential Learning, Career Maturity, Professional Skills, Career Management, Meaningful Connections, and Global Perspective. (The University of Kansas, KU University Career Centers. 2014) (Peter Knight and Mantz Yorke, 2004).

Global Perspective: The global perspective is a vision of things that considers the entire world as an integrated system and community, this can be achieved through an awareness of social, economic, and cognitive contexts such as nationality, ethnicity, culture, community, and language, and systems of the world and applying that perspective in the context of work.

Methodology: The survey design was chosen for this study because it was found to be most appropriate to collected information directly about teachers regarding aspects of employability in the PG curriculum.

Sampling Design: The population of this study includes Arts, Science and Commerce teachers selected from 14 departments with 76 teachers serving in the selected department were considered for the random sampling technique for this study.

Tool used for the Study*:* The investigator was Used the following tool for the collection of relevant data. Teacher's opinion regarding the availability Employability Skills of Postgraduate Curriculum Developed by Shilpa.V and Dr. S.S. Patil.

Statistical Techniques: The researcher used Percentage analysis. Inferential Analysis and Interpretation.

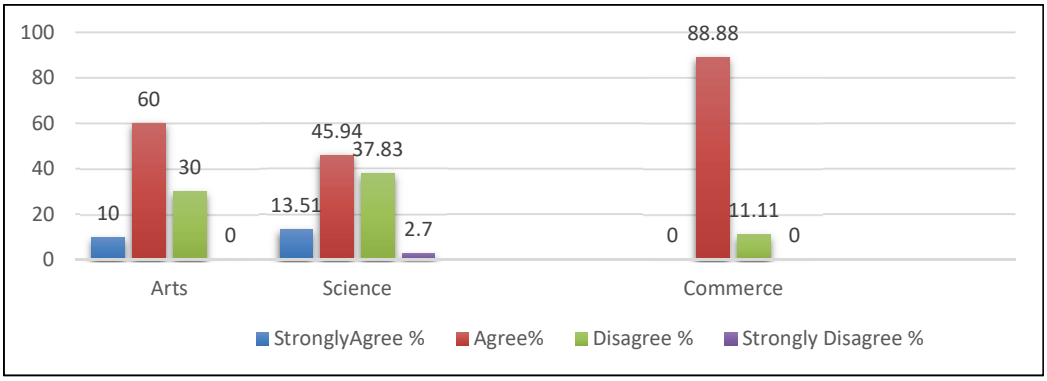
Objective-1: To identify the presence of Global perspective related aspects of Employability skills in selected Postgraduate Curricula of Kuvempu University as perceived by Teachers of Postgraduate departments**.**

Hypothesis-1: There is no significant difference between the opinions of the teaching faculty of Arts, Science and Commerce discipline with reference to the aspects of Employability in the Curriculum.

1. The postgraduate curriculum provides opportunities to engage with and work with alumni, the community, employers, professional organizations, voluntary organizations etc.

Group Statistics	Discipline	Responses									
		Strongly Agree		Agree		Disagree		Strongly Disagree		Total %	
		N	%	N	%	N	%	N	%	N	%
Employability Aspects of curriculum	**Arts**	3	10	18	60	9	30	0	**0**	**30**	**100**
	Science	5	13.51	17	45.94	14	37.83	1	2.70	**37**	**100**
	Commerce	0	0	8	88.88	1	11.11	0	0	**9**	**100**
	Total	8	10.52	43	56.57	24	31.56	1	1.31	**76**	**100**

Figure- 1: Shows the percentage scores of the opinion of the PG teachers of Arts, Science, and Commerce regarding the aspect that the PG curriculum provides opportunities to engage with and work with alumni, the community, Employers, professional organisations, voluntary organisations etc,



The percentage scores of the opinion of the PG teachers of Arts, Science, and Commerce regarding the aspect that the PG curriculum provides opportunities to engage with and work with alumni, the community, Employers, professional organisations, voluntary organisations etc, was calculated. Table (1) revealed that 10% of Arts teachers Strongly Agree, 60% Agree and 30% disagree. Among the Science teachers 13.51% Strongly Agree, 45.94% Agree, 37.83% disagree and 2.7% Strongly disagree. Among the Commerce teachers, 88.88% Agree, 11.11% Agree. No commerce teachers Strongly Agree and Arts Commerce teachers strongly disagree.

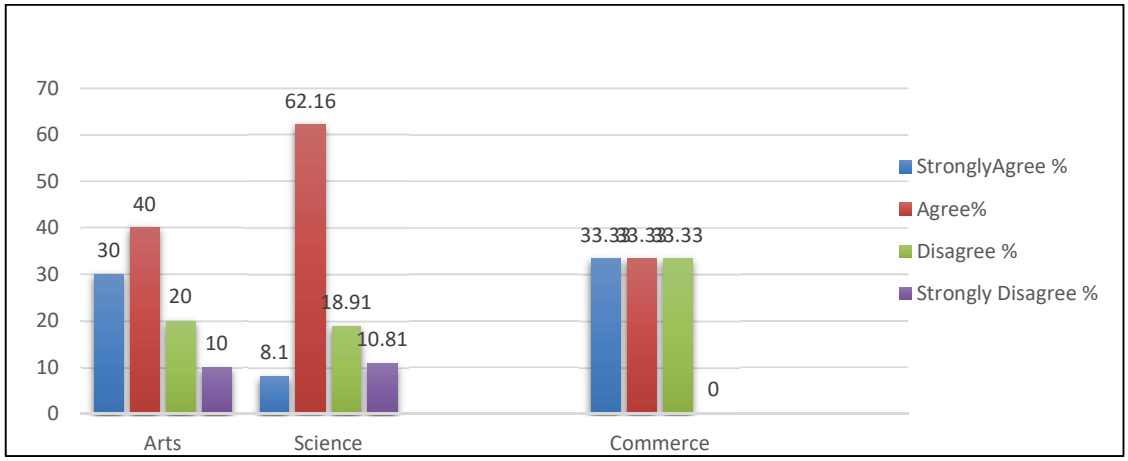
It is clear that majority of the teachers of all the three discipline either strongly agree or agree that the curriculum of their respective subjects provides opportunities to engage with and work with alumni, the community, Employers, professional organisations, voluntary organisations etc. There is less disagreement and very less strongly disagreement about the above mentioned employability aspects.

However the Commerce teachers are more positive in the opinion (Agree= 88.88%) about the aspects of provides opportunities to engage with and work with alumni, the community, Employers, professional organisations, voluntary organisations etc, Followed by Arts PG Teachers (Strongly Agree=10%, Agree=60%) Science PG Teachers (Strongly Agree=13.51%, Agree=45.94%).

2. The postgraduate curriculum includes cultural awareness, foreign languages, international understanding, global perspectives to identify international opportunities.

Group Statistics	Discipline	Responses									
		Strongly Agree		Agree		Disagree		Strongly Disagree		Total %	
		N	%	N	%	N	%	N	%	N	%
Employability Aspects of curriculum	**Arts**	9	30	12	40	6	20	3	10	**30**	**100**
	Science	3	8.10	23	62.16	7	18.91	4	81	**37**	**100**
	Commerce	3	33.33	3	33.33	3	33.33	0	0	**9**	**100**
	Total	15	19.73	38	50	16	21.05	7	9.21	**76**	**100**

Figure- 2: Shows the percentage scores of the opinion of the PG teachers of Arts, Science, and Commerce, regarding the aspect that the PG curriculum includes cultural awareness, foreign languages, international understanding, global perspectives to identify international opportunities.



The percentage scores of the opinion of the PG teachers of Arts, Science, and Commerce regarding the aspect that the PG curriculum includes cultural awareness, foreign languages, international understanding, global perspectives to identify international opportunities, was calculated. Table (2) revealed that 30% of Arts teachers Strongly Agree, 40% Agree, 20% disagree and 10% Strongly disagree. Among the Science teachers 8.1% Strongly Agree, 62.16% Agree, 18.91% disagree and 10.81% strongly disagree. Among the Commerce teachers, 33.33% Strongly Agree, 33.33% Agree and 33.33% Strongly disagree. No commerce teachers strongly disagree.

It is clear that majority of the teachers of all the three discipline either strongly agree or agree that the curriculum of their respective subjects includes cultural awareness, foreign languages, international understanding, and global perspectives to identify international opportunities. There is less disagreement and very less strongly disagreement about the above mentioned employability aspects.

However the Science teachers are more positive in the opinion (Strongly Agree=8.1% Agree=62.16%)) about the aspects of cultural awareness, Foreign languages, international understanding, global perspectives to identify international opportunities. Followed by Arts PG Teachers (Strongly Agree=30%, Agree=40%) Commerce PG Teachers (Strongly Agree=13.51%, Agree=45.94%).

Findings of the Study:

In the present study investigator has attempted to find the significant difference between the opinions of the teaching faculty of Arts, Science, and Commerce discipline with reference Global perspectives first aspects of Employability in the Curriculum. Researcher observed from the opinions of the PG teachers curriculum includes curriculum focuses on behavioural aspects of provides opportunities to engage with and work with alumni, the community, Employers, professional organisations, voluntary organisations in their curriculum seems to be more agreement with regard to the Commerce teachers followed by Arts teachers compared to that of Science teachers. The opinions of the teaching faculty of Arts, Science, and Commerce

discipline with reference Global perspectives second aspects of Employability in the Curriculum. Researcher observed from the opinions of the PG teachers curriculum includes curriculum focuses on behavioural aspects includes cultural awareness, Foreign languages, international understanding, global perspectives to identify international opportunities in their curriculum seems to be more agreement with regard to the Science teachers followed by Arts teachers compared to that of Commerce teachers.

Conclusion:

The present study was carried out to explore the opinion of the teaching faculty of Arts, Science, and Commerce discipline. The Commerce teachers are more positive opinion of curriculum focuses on behavioral aspects of provides opportunities to engage with and work with alumni, the community, Employers, professional organisations, voluntary organisations. The Science teachers are more positive opinion of curriculum focuses on behavioural aspects includes cultural awareness, foreign languages, international understanding, and global perspectives to identify international opportunities. Hence Arts, Science and Commerce teachers has suggested that PG Curriculum should be interdisciplinary approach to learning covers all the social, economic, and environmental dimensions. Study materials should be available in both global as well as local languages. Students should be given opportunities to participate in presentations and such to build confidence, soft skills. Organizing workshops, discussion with expert, demonstrations of skills, MOCK interviews and training programs for the students. Interaction with peers from various universities to have a global perspective and develop broad thinking. Government initiatives like the Skill India Mission, National Education Policy (NEP), and Digital India, alongside private sector investments, have made India's talent highly employable on a global scale.

EMPOWERING FUTURE EDUCATORS: SKILL DEVELOPMENT STRATEGIES FOR ENHANCING EMPLOYABILITY AMONG B.ED. STUDENTS

Jagadeesha N
Assistant Professor, Vidya Vikas B.Ed College, Mysore
Anantharamu M L
Assistant Professor,Vidya Vikas B.Ed College, Mysore

Abstract

The changing nature of education and employment has created new expectations from prospective teachers. A professional degree in education provides essential theoretical and pedagogical knowledge, but contemporary teachers also require communication skills, digital competence, critical thinking, creativity, collaboration, problem-solving, leadership, emotional competence and the ability to learn continuously. Therefore, strengthening the employability of B.Ed. students requires a shift from qualification-oriented teacher education towards competency-oriented professional preparation. This article discusses the significance of skill development in improving the employability of B.Ed. students and examines strategies that teacher education institutions can adopt to prepare future educators for changing professional demands. The discussion focuses on communication skills, digital literacy, pedagogical competence, critical thinking, creativity, interpersonal skills, leadership, reflective practice, research competence and adaptability. Experiential learning, microteaching, teaching practice, project-based learning, digital pedagogy, peer learning, career guidance, professional portfolios and school-institution partnerships are suggested as important approaches for developing these competencies. Particular attention is given to digital competence because technology has become an integral part of teaching, learning, assessment and professional development. UNESCO's ICT Competency Framework for Teachers identifies digital competencies as an important component of pre-service and in-service teacher preparation (UNESCO, 2018). The article concludes that B.Ed. programmes should systematically integrate employability skills into curriculum, pedagogy, practical training and assessment. A skill-oriented approach can help future teachers become professionally confident, technologically capable, reflective and adaptable educators who are prepared to respond to the needs of contemporary educational institutions.

Keywords: *Skill Development, Employability, B.Ed. Students, Teacher Education, Professional Competence, Digital Skills, Future Educators*

Introduction:

Teacher education occupies a central position in the development of an effective education system. The quality of teachers has a direct influence on classroom processes, learner participation and educational outcomes. Traditionally, teacher education programmes have concentrated on developing knowledge of educational psychology, curriculum, pedagogy, assessment and classroom teaching. Although these areas remain fundamental, the responsibilities of teachers have expanded considerably in recent years.

The contemporary teacher works in an environment influenced by digital technology, diverse learning needs, changing curricula and new approaches to assessment. Teachers are increasingly expected to use digital resources, communicate effectively, collaborate with colleagues, design learner-centred activities, analyse classroom problems and continuously improve their professional practice. Consequently, employability of B.Ed. students should be understood in a broader sense than simply possessing a teaching qualification.

Employability refers to the combination of knowledge, skills, attitudes and personal qualities that enables an individual to obtain employment, perform effectively in a professional setting and adapt to changing workplace requirements. For B.Ed. students, employability includes both teaching-specific competencies and transferable skills that support professional effectiveness.

The increasing importance of digital competence further strengthens the need for a skills-oriented approach. UNESCO notes that digital competencies have become important for participation in society, lifelong learning and employment, while teacher preparation needs to include effective use of technology for teaching and learning (UNESCO, 2023).

Therefore, B.Ed. institutions need to move beyond a purely theoretical model of teacher preparation and create learning environments in which prospective teachers can practise, demonstrate and evaluate professional competencies.

Concept of Employability in Teacher Education:

Employability is a multidimensional concept. It does not refer only to obtaining a job immediately after completing a programme. It also includes the capacity to perform effectively, respond to professional challenges, acquire new knowledge and remain relevant in a changing work environment.

For B.Ed. students, employability can be viewed through three broad dimensions:

Professional Competence

Professional competence includes lesson planning, classroom management, teaching methods, assessment, inclusive practices, subject-specific pedagogy and understanding of learners.

Transferable Skills

Transferable skills include communication, teamwork, leadership, creativity, problem-solving, critical thinking, decision-making and interpersonal relationships.

Digital and Future-Oriented Competence

Digital competence includes the ability to use technology meaningfully for teaching, learning, assessment, communication, content creation and professional development. UNESCO's ICT Competency Framework for Teachers provides a structured framework for integrating digital competencies into teacher education and professional learning.

Thus, employability should be developed as an integrated component of teacher preparation rather than as a separate activity conducted only before campus recruitment.

Importance of Skill Development among B.Ed. Students

Skill development is important because the professional role of a teacher requires the integration of knowledge and practice. A student may possess considerable theoretical knowledge but may experience difficulty in classroom communication, technology integration or classroom management without sufficient practical preparation.

Skill-oriented teacher education can help B.Ed. students:

- apply theoretical knowledge in real classroom situations;
- communicate ideas clearly and confidently;
- use digital technologies for educational purposes;
- manage diverse classroom situations;
- work effectively with colleagues;
- solve educational problems systematically;
- develop creative approaches to teaching;
- undertake classroom-based research;
- reflect upon and improve their own teaching; and
- adapt to changing educational and professional requirements.

UNESCO's teacher competency framework identifies areas including curriculum and assessment, pedagogy, application of digital skills, organisation and administration, and professional learning. These areas demonstrate that effective teacher preparation requires a combination of pedagogical, technological and professional competencies.

Essential Skills for Enhancing Employability of B.Ed. Students:

Communication Skills

Communication is fundamental to teaching. A teacher must explain concepts, ask questions, provide feedback, listen to students and communicate with parents and colleagues. B.Ed. students should therefore receive regular opportunities to practise oral and written communication. Activities such as seminars, group discussions, debates, presentations, storytelling, role play and mock teaching can improve communication confidence. Effective communication also involves listening. Prospective teachers should learn to understand learners' questions, concerns and perspectives rather than concentrating only on delivering content.

Digital Competence

Digital competence has become an important component of professional teaching. B.Ed. students should be familiar with presentation tools, online learning platforms, digital assessment, educational applications, multimedia resources, open educational resources and virtual learning environments.

However, digital competence should not be restricted to knowing how to operate devices. The important issue is whether technology is being used appropriately to improve learning. UNESCO's ICT Competency Framework describes digital competencies across areas such as teaching and learning, administration and continuing professional development.

B.Ed. students can develop digital competence by preparing digital lesson plans, designing online quizzes, creating instructional videos, developing e-content and conducting technology-supported teaching demonstrations.

Pedagogical Skills

Pedagogical competence remains the foundation of teacher employability. Prospective teachers should develop competence in lesson planning, selection of teaching methods, classroom interaction, questioning techniques, assessment and classroom management.

Teaching practice should therefore be treated as a major professional learning opportunity.

B.Ed. students should be encouraged to plan lessons, teach them, receive feedback and revise their strategies.

Critical Thinking

Teachers frequently encounter complex educational situations. They need to analyse problems before deciding how to respond. Critical thinking can be developed through case studies, classroom problem analysis, educational debates, action research and reflective discussions. Instead of simply asking students to reproduce information, teacher education should encourage them to interpret evidence and justify professional decisions.

Problem-Solving Skills

Classrooms contain problems related to learning difficulties, student motivation, attendance, behaviour, assessment and classroom diversity. Prospective teachers need the ability to identify problems and develop practical solutions. Problem-based learning can provide opportunities for B.Ed. students to work on realistic educational situations and develop decision-making abilities.

Creativity and Innovation

Creative teachers can design learning experiences that capture students' attention and encourage active participation. Creativity can be developed through instructional material preparation, innovative lesson planning, educational games, project work, storytelling, arts-integrated activities and technology-supported teaching. Innovation does not necessarily mean using sophisticated technology. It can also involve developing a new teaching strategy, adapting an existing method to a particular group of learners or creating an inexpensive teaching aid.

Collaboration and Teamwork

Teaching is increasingly collaborative. Teachers work with colleagues, administrators, parents, community members and other professionals. B.Ed. programmes should provide opportunities for collaborative projects, peer teaching, group assignments and institutional activities. Such experiences help students learn how to divide responsibilities, negotiate ideas and achieve common objectives.

Leadership Skills

Teachers perform several leadership functions in schools. They may coordinate activities, lead committees, organize events, guide students and participate in institutional initiatives.

Leadership skills can be developed by assigning B.Ed. students responsibilities for seminars, cultural programmes, community activities, educational exhibitions and student-led projects.

Emotional and Interpersonal Competence

Teachers interact with learners from different backgrounds and with varying emotional and educational needs. Empathy, patience, active listening, cooperation and emotional awareness are therefore essential. Role play, group counselling activities, peer interaction and classroom simulations can help B.Ed. students understand interpersonal situations and develop appropriate professional responses.

Research and Reflective Skills

Teachers should be capable of examining their own classroom practices and identifying areas for improvement. Research activities and reflective practice can help students develop this

ability. B.Ed. students can be encouraged to undertake small classroom-based investigations, maintain reflective journals and analyse feedback from teaching practice. Such activities can promote evidence-based professional decision-making.

Strategies for Skill Development:

Experiential Learning

Skill development becomes meaningful when students receive opportunities to learn through experience. Teaching practice, school internships, field visits, community activities and classroom observations enable B.Ed. students to connect theoretical learning with professional situations. Experiential activities should include preparation, actual performance, feedback and reflection. This process helps students understand not only what they have learned but also how effectively they can apply it.

Microteaching

Microteaching provides a structured environment for practising individual teaching skills. B.Ed. students can focus on explanation, questioning, reinforcement, introduction, stimulus variation and classroom interaction. Repeated practice followed by constructive feedback can gradually improve teaching competence and confidence.

Peer Learning

Peer learning allows students to learn from one another. B.Ed. students can observe their classmates' teaching, provide feedback and discuss alternative teaching strategies. Peer learning also promotes communication, cooperation, self-evaluation and professional reflection.

Project-Based Learning

Project-based learning can integrate several employability skills simultaneously. A group of B.Ed. students may undertake a project related to inclusive education, digital learning, environmental education, community awareness or school improvement. Such projects can develop research, communication, teamwork, leadership, creativity and problem-solving skills.

Digital Pedagogy Training

Digital training should be incorporated systematically into the B.Ed. programme. Students can be asked to develop digital teaching resources and demonstrate how these resources support particular learning objectives. UNESCO's framework emphasizes that digital competencies should be incorporated into curriculum design, teacher training and continuing professional development.

Mock Interviews and Demonstration Lessons

Employability preparation should include activities that simulate actual recruitment situations. Mock interviews can help students improve professional communication and confidence.

Similarly, demonstration lessons can prepare students for teacher recruitment processes in which candidates may be required to teach a short lesson before a selection panel.

Professional Portfolio Development:

A professional portfolio can provide evidence of a student's development. It may contain:

- curriculum vitae;
- lesson plans;

- teaching-learning materials;
- digital resources;
- teaching practice records;
- certificates;
- research projects;
- reflective journals;
- assessment activities; and
- evidence of participation in seminars and workshops.

Such a portfolio can help students present their competencies more effectively to prospective employers.

Career Guidance and Mentoring

Career guidance should be integrated into teacher education rather than being restricted to the final stage of the programme. Faculty members and experienced teachers can mentor students regarding career opportunities, professional expectations, interview preparation and further education.

School-Institution Partnerships

Strong collaboration between B.Ed. institutions and schools can improve practical preparation. Schools can provide opportunities for observation, teaching practice, mentoring and classroom-based projects.

Such partnerships can also help teacher education institutions understand the competencies expected from beginning teachers.

Continuous Professional Development

Employability should be viewed as a continuing process. B.Ed. students should develop the habit of learning beyond the formal programme through online courses, workshops, professional networks, conferences and self-directed learning.

The digital transformation of education makes continuous professional learning particularly important because teachers must continually update their technological and pedagogical knowledge.

Role of Teacher Education Institutions:

Teacher education institutions have a significant responsibility in developing employable future teachers. Skill development cannot be achieved through isolated workshops alone. It should be integrated throughout the curriculum and supported through institutional practices.

Teacher education institutions should:

1. integrate employability competencies into course objectives;
2. provide adequate opportunities for teaching practice;
3. strengthen digital infrastructure and digital pedagogy;
4. encourage project-based and experiential learning;
5. organize communication and personality-development activities;
6. provide mentoring and career guidance;
7. promote research and reflective practice;
8. develop partnerships with schools;
9. organize seminars, workshops and professional development activities; and

10. use competency-based assessment alongside conventional examinations.

The UNESCO ICT Competency Framework also emphasizes that effective implementation requires institutional leadership and supportive conditions for teacher professional development.

Assessment of Employability Skills:

An important issue is the assessment of skills. If B.Ed. students are evaluated primarily through written examinations, several important competencies may remain unmeasured.

A comprehensive assessment system should include:

- teaching demonstrations;
- practical examinations;
- portfolios;
- presentations;
- project work;
- peer assessment;
- self-assessment;
- classroom observation;
- reflective journals; and
- internship performance.

Such assessment can provide a more complete picture of whether students are capable of applying their knowledge in authentic professional situations.

Challenges in Skill Development:

Several challenges may affect the effective implementation of employability-oriented teacher education. First, excessive emphasis on theoretical examinations may reduce opportunities for practical skill development. Second, differences in students' prior exposure to technology can create unequal levels of digital competence. Third, inadequate infrastructure may limit opportunities for technology-supported learning. Fourth, insufficient interaction between teacher education institutions and schools may weaken practical preparation.

Another challenge is the rapid pace of technological change. A digital tool learned during teacher education may become less relevant later. Consequently, teacher education should focus not only on specific technologies but also on the ability to learn, evaluate and adapt to new technologies.

UNESCO highlights the continuing importance of digital competency development for learning and employment, while also recognizing issues such as unequal access and the digital divide.

Suggestions:

The following measures may strengthen the employability of B.Ed. students:

1. **Introduce an employability-skills component** within teacher education programmes.
2. **Strengthen practical teaching experiences** through meaningful school internships.
3. **Provide regular digital pedagogy training** rather than one-time ICT workshops.
4. **Conduct communication and interview-skills programmes** for prospective teachers.

5. **Promote student-led seminars and activities** to develop leadership.
6. **Use case studies and problem-based learning** to develop critical thinking.
7. **Encourage action research** to develop inquiry and problem-solving abilities.
8. **Develop professional portfolios** for every B.Ed. student.
9. **Establish stronger school-college partnerships** for mentoring and practical exposure.
10. **Adopt competency-based assessment** to evaluate practical and transferable skills.
11. **Encourage lifelong learning** through MOOCs, workshops and professional learning communities.
12. **Create career guidance and placement support systems** within teacher education institutions.

Conclusion:

The preparation of future teachers requires a comprehensive approach that combines academic knowledge, pedagogical competence, practical experience and employability skills. The changing educational environment has expanded the role of teachers beyond traditional classroom instruction. Teachers are now expected to communicate effectively, integrate technology, work collaboratively, solve problems, demonstrate creativity, respond to learner diversity and continuously improve their professional practice.

For this reason, skill development should become an integral part of B.Ed. education. Communication, digital competence, pedagogical skills, critical thinking, creativity, leadership, collaboration, emotional competence, research ability and reflective practice can collectively contribute to stronger professional readiness.

The emphasis on digital competence is particularly important. UNESCO's ICT Competency Framework for Teachers provides a comprehensive basis for developing teachers' abilities to use technology for teaching, learning, administration and professional development. At the same time, employability should not be reduced to technological proficiency. Human qualities such as empathy, communication, creativity, adaptability and professional responsibility remain central to effective teaching.

Ultimately, the goal of teacher education should be to produce **future-ready educators who are knowledgeable, skilled, confident, reflective, adaptable and committed to lifelong professional learning**. When B.Ed. programmes systematically integrate skill development with academic and practical preparation, teacher education can make a stronger contribution to both graduate employability and the quality of education.

Dr. Manjunath H.P
Professor, Department of Education Sahyadri Arts College Shivamogga

Abstract

Teacher educators occupy a central position in teacher education because they contribute to the academic, pedagogical and professional preparation of prospective teachers. Their professional development and job satisfaction are therefore important considerations in strengthening the quality of teacher education. The National Curriculum Framework for Teacher Education emphasizes the professional preparation of teacher educators and the importance of continuing professional development, while the National Education Policy 2020 gives considerable importance to continuous professional learning and professional growth (National Council for Teacher Education [NCTE], 2009; Ministry of Education, 2020). The present paper proposes a future empirical study to examine the relationship between professional development and job satisfaction among teacher educators and to investigate their possible relationship with student teachers' academic achievement. The proposed study is based on the assumption that professionally engaged and satisfied teacher educators may be better positioned to provide effective teaching, mentoring, feedback and academic support to student teachers. Previous Indian research has reported a significant positive relationship between professional development and job satisfaction among teacher educators, but comparatively less attention has been given to examining whether these factors are associated with the academic achievement of student teachers (Kaur & Bhullar, 2019). The proposed study will employ a descriptive-correlational research design. Teacher educators from selected teacher education institutions and their student teachers will constitute the proposed sample. Data will be collected through an appropriate professional development scale, a job satisfaction scale and student teachers' academic achievement records. Descriptive statistics, Pearson's product-moment correlation and multiple regression analysis may be used after data collection. No empirical findings are presented in this paper because data have not yet been collected. The study is expected to provide a framework for understanding how teacher educators' professional growth and workplace satisfaction may relate to student teachers' academic outcomes and may offer implications for institutional professional development, supportive working environments and quality improvement in teacher education.

Keywords: *Teacher Educators, Professional Development, Job Satisfaction, Student Teachers, Academic Achievement, Teacher Education, Professional Competence, Continuous Professional Development*

1. Introduction

Teacher education is an important component of the educational system because it prepares prospective teachers with the knowledge, skills, attitudes and professional dispositions required for effective teaching. The quality of teacher preparation is influenced by several

factors, including curriculum, institutional resources, pedagogical practices and the competence of teacher educators. The National Curriculum Framework for Teacher Education (NCFTE) identifies teacher educators as an important component of the teacher education system and gives attention to their professional preparation and development (NCTE, 2009).

Teacher educators perform multiple professional roles. They teach prospective teachers, supervise practical experiences, provide academic guidance, engage in research, assess student learning and contribute to curriculum development. These responsibilities require continuous updating of knowledge and professional competencies. The NCFTE emphasizes continuing professional development as an opportunity for professionals to reflect on their practice, deepen academic knowledge and engage with research related to learners and education (NCTE, 2009). The importance of continuous professional development has also been emphasized by India's National Education Policy 2020. NEP 2020 states that teachers should receive continuous opportunities for self-improvement and learning about innovations and advances in their profession. It envisages professional development through multiple modes, including workshops and online professional learning, and specifies a target of at least 50 hours of continuous professional development opportunities annually for teachers (Ministry of Education, 2020). Alongside professional development, job satisfaction is an important dimension of professional life. Job satisfaction broadly concerns an individual's positive or negative evaluation of their work and working conditions. In teacher education, factors such as professional autonomy, institutional support, workload, recognition, interpersonal relationships and opportunities for professional growth may influence how teacher educators experience their work. Indian research has already examined the relationship between professional development and job satisfaction among teacher educators. Kaur and Bhullar (2019), for example, studied 120 teacher educators in Punjab and reported a significant positive relationship between professional development and job satisfaction. However, the relationship between these teacher-educator variables and the academic achievement of student teachers provides an opportunity for further investigation. The present paper therefore proposes a research framework that connects teacher educators' professional development and job satisfaction with student teachers' academic achievement.

2. Background and Rationale of the Study

Teacher educators influence student teachers not only through formal classroom instruction but also through mentoring, modelling professional behaviour, providing feedback and facilitating reflective learning. A teacher educator who regularly updates professional knowledge may be able to introduce student teachers to contemporary pedagogical approaches, educational technologies, assessment practices and research-based perspectives.

Professional development can take several forms, including workshops, seminars, conferences, refresher programmes, research activities, peer learning, professional learning communities, mentoring and self-directed learning. The NCFTE identifies continuing professional development as an important means of exploring and improving professional practice, updating disciplinary knowledge and engaging in research concerning learners and education (NCTE, 2009). Job satisfaction may also influence professional engagement. Recent research on teacher educators has examined the relationship between work-related factors,

well-being and job satisfaction, indicating the importance of understanding teacher educators' professional experiences rather than focusing exclusively on student outcomes.

The proposed study is therefore based on the idea that professional development and job satisfaction may be interconnected and that both may have implications for the quality of academic support provided to student teachers.

3. Review of Related Literature

3.1 Professional Development of Teacher Educators

Professional development is generally understood as an ongoing process rather than a single training event. It may involve formal courses as well as informal learning, reflection, collaboration and research. The NCFTE recognizes continuing professional development as an important part of professional growth. It describes professional development as involving reflection on practice, updating knowledge and engaging with research related to learners and education (NCTE, 2009). NEP 2020 similarly places continuous professional development within the broader vision of improving teaching quality. The policy encourages professional learning through workshops, online modules and opportunities for teachers to share ideas and good practices (Ministry of Education, 2020).

3.2 Professional Development and Job Satisfaction

An especially relevant Indian study was conducted by Kaur and Bhullar (2019). Their study, *Professional Development of Teacher Educators in Relation to Job Satisfaction*, involved 120 teacher educators from colleges of education in Punjab. The researchers reported a significant positive relationship between professional development and job satisfaction among the teacher educators studied. This previous finding provides a useful foundation for the proposed research. However, the proposed study moves beyond examining only the relationship between professional development and job satisfaction by considering **student teachers' academic achievement as a possible outcome variable**.

3.3 Job Satisfaction among Teacher Educators

Earlier Indian research has also examined job satisfaction among teacher educators. An entry in NCERT's Online Survey of Research in Education describes Kaur's 2001 doctoral research on job satisfaction, professional and educational interests, creativity and attitude towards teaching among teacher educators at different levels of teacher education in Punjab. The study used teacher educators from NTT, ETT and B.Ed. institutions and examined differences associated with institutional and demographic variables. Such research demonstrates that job satisfaction among teacher educators has been a subject of investigation in India for several decades. Nevertheless, changing expectations regarding technology, research, professional development and teacher education provide reasons for continued investigation.

3.4 Professional Development and Student Learning

Research on professional development in the broader teaching profession suggests that participation in professional development can be associated with teachers' professional characteristics and job satisfaction. Yoon and Kim (2022), for example, identified different patterns of teachers' participation in professional development and found differences in self-efficacy and job satisfaction across participation profiles. Such findings cannot automatically be generalized to teacher educators or to student teachers' academic achievement. This

distinction is important. The proposed study therefore seeks to examine the relationship empirically rather than assuming that professional development automatically produces higher academic achievement.

4. Research Gap

The review indicates three important points.

First, professional development is recognized as an important component of teacher education policy and professional growth in India (NCTE, 2009; Ministry of Education, 2020).

Second, previous Indian research has already established an empirical interest in the relationship between professional development and job satisfaction among teacher educators. Kaur and Bhullar (2019) specifically reported a significant positive relationship between these two variables. Third, there is scope to extend this line of inquiry by examining whether teacher educators' professional development and job satisfaction are associated with **student teachers' academic achievement**. Thus, the novelty of the proposed study should be presented carefully. It does **not** claim that professional development and job satisfaction among teacher educators have never been studied. Rather, it proposes an integrated framework connecting these variables with student teachers' academic achievement.

5. Statement of the Problem

"Professional Development and Job Satisfaction among Teacher Educators: A Proposed Study of Their Impact on Student Teachers' Academic Achievement."

The term "impact" in the title refers to the proposed investigation of possible predictive relationships. Because the study has not yet been conducted, the paper does not claim causal impact.

6. Objectives of the Study

The proposed study will have the following objectives:

1. To assess the level of professional development among teacher educators.
2. To assess the level of job satisfaction among teacher educators.
3. To determine the level of academic achievement of student teachers.
4. To examine the relationship between professional development and job satisfaction among teacher educators.
5. To examine the relationship between teacher educators' professional development and student teachers' academic achievement.
6. To examine the relationship between teacher educators' job satisfaction and student teachers' academic achievement.
7. To examine whether professional development and job satisfaction together predict student teachers' academic achievement.

7. Hypotheses

The following null hypotheses may be tested after data collection:

H01: There is no significant relationship between professional development and job satisfaction among teacher educators.

H02: There is no significant relationship between teacher educators' professional development and student teachers' academic achievement.

H03: There is no significant relationship between teacher educators' job satisfaction and

student teachers' academic achievement.

H04: Professional development and job satisfaction do not significantly predict student teachers' academic achievement.

8. Proposed Methodology

8.1 Research Design

The proposed study will adopt a **descriptive-correlational research design**. The descriptive component will determine the levels of professional development and job satisfaction, while the correlational component will examine relationships among the variables.

A correlational design is appropriate because the purpose is initially to examine associations rather than to claim causal effects.

8.2 Population

The proposed population will comprise teacher educators working in recognized teacher education institutions and student teachers enrolled in teacher education programmes.

8.3 Sample

A suitable sample may be selected from government, aided and private teacher education institutions. The researcher may use stratified random sampling to obtain representation from different types of institutions.

The final sample size should be determined using an appropriate sampling procedure and, preferably, a power analysis before data collection.

8.4 Variables

Independent:

- Professional development
- Job satisfaction

Dependent Variable:

- Student teachers' academic achievement

8.5 Tools

The researcher may use:

1. A standardized or researcher-developed **Professional Development Scale for Teacher Educators**.
2. A standardized **Job Satisfaction Scale** suitable for teacher educators.
3. Official academic records or semester examination scores to measure student teachers' academic achievement.
4. A demographic and professional information schedule.

The selected instruments should be examined for reliability and validity before administration.

8.6 Data Collection Procedure

After obtaining permission from the concerned teacher education institutions, informed consent should be obtained from participants. Teacher educators may complete the professional development and job satisfaction instruments. Student teachers' academic achievement may be obtained from officially available institutional records, subject to institutional permission and ethical requirements.

8.7 Proposed Data Analysis

After data collection, the following statistical techniques may be used:

- Mean
- Standard deviation
- Percentage
- Pearson's product-moment correlation
- Multiple regression analysis
- t-test or ANOVA, if additional subgroup comparisons are included

The level of significance may be fixed at **0.05**.

No numerical results are reported in the present paper because the proposed study has not yet been conducted.

9. Educational Implications

If future empirical evidence supports the proposed relationships, teacher education institutions may consider professional development as an integral component of institutional quality improvement. First, institutions may provide systematic professional development opportunities addressing pedagogy, research, assessment, inclusive education and educational technology. Second, professional development should not be restricted to one-time workshops. Continuous learning, reflection, peer collaboration and research-oriented professional development may provide more sustained opportunities for professional growth. This direction is consistent with the emphasis on continuing professional development in NCFTE and NEP 2020 (NCTE, 2009; Ministry of Education, 2020). Third, institutions should pay attention to working conditions that may influence job satisfaction, including professional autonomy, recognition, workload, institutional leadership and opportunities for career advancement. Fourth, student teachers' academic achievement should be considered alongside other indicators of teacher education quality. Academic marks alone cannot capture the complete development of a future teacher.

10. Limitations of the Proposed Study

The proposed study has several anticipated limitations.

First, a correlational design cannot by itself establish causality. Even if a statistically significant relationship is found between teacher educators' professional development and student teachers' academic achievement, it would not prove that professional development caused the achievement. Second, student teachers' academic achievement is influenced by numerous factors, including prior achievement, motivation, learning opportunities, institutional environment, assessment practices and individual differences. Third, self-report measures of professional development and job satisfaction may be affected by participants' perceptions and response tendencies. Fourth, if the sample is restricted to selected institutions or a particular geographical region, generalization of findings may be limited. Future studies may therefore adopt longitudinal, mixed-method or multilevel designs to examine the issue in greater depth.

11. Conclusion

Teacher educators are important contributors to the quality of teacher preparation. Their professional responsibilities require continuous learning, reflection, research engagement and a3aptation to changing educational needs. Indian policy documents, particularly the NCFTE 2009 and NEP 2020, recognize the importance of professional development and continuing

professional learning in strengthening educational quality (NCTE, 2009; Ministry of Education, 2020). Existing Indian research has already demonstrated interest in the relationship between professional development and job satisfaction among teacher educators. Kaur and Bhullar (2019) reported a significant positive relationship between the two variables among teacher educators in Punjab. The proposed study seeks to extend this area of research by examining professional development and job satisfaction in relation to student teachers' academic achievement. It does not assume that these variables automatically produce higher achievement. Instead, it proposes an empirical investigation of whether meaningful relationships exist. The study may ultimately help teacher education institutions understand the importance of investing in the professional growth and workplace well-being of teacher educators. If supported by future empirical evidence, such an approach could contribute to improved academic guidance, mentoring and learning opportunities for student teachers. At this stage, however, **no empirical conclusion can be drawn** because data have not been collected. The value of the present paper lies in establishing a theoretically and policy-informed research framework that can be tested through a future empirical study.

ROLE OF ARTIFICIAL INTELLIGENCE IN ADDRESSING INDIVIDUAL DIFFERENCES IN MATHEMATICS LEARNING

Dr Manjunath H M
Assistant Professor, Sarada Vilas Teachers College, Mysore-04

Abstract

Mathematics is a subject in which learners differ considerably in their prior knowledge, learning pace, reasoning abilities, interests, motivation, confidence, and problem-solving strategies. Traditional classroom instruction often follows a common pace and uniform instructional approach, making it difficult for teachers to respond adequately to these individual differences. Artificial Intelligence (AI) offers new possibilities for creating personalized and adaptive mathematics learning environments. AI-powered educational tools can analyse learners' responses, identify learning gaps and misconceptions, provide immediate feedback, recommend appropriate learning resources, and adjust the difficulty of mathematical tasks according to individual needs. This paper examines the role of AI in addressing individual differences in mathematics learning, particularly from the perspective of teacher education. It discusses AI-supported personalized learning, intelligent tutoring systems, adaptive assessment, feedback, mathematical problem-solving, learning analytics, and differentiated instruction. The paper also highlights the changing role of teachers from information providers to facilitators, mentors, and designers of meaningful learning experiences. Finally, it discusses challenges such as digital inequality, accuracy of AI-generated responses, data privacy, overdependence on technology, and the need for teacher supervision. The paper argues that AI should complement, rather than replace, the professional role of mathematics teachers and can contribute to more inclusive, learner-centred, and responsive mathematics education.

Keywords: *Artificial Intelligence, Mathematics Learning, Individual Differences, Personalized Learning, Adaptive Learning, Intelligent Tutoring Systems, Learning Analytics, Teacher Education*

1. Introduction

Mathematics learning is not a uniform process. Students enter the classroom with different levels of mathematical knowledge, abilities, experiences, interests, learning speeds, and attitudes towards mathematics. Some students understand mathematical concepts quickly, while others require additional explanations, examples, practice, and encouragement. Similarly, some learners are confident in problem-solving, whereas others experience difficulty because of misconceptions, fear of mathematics, or inadequate foundational knowledge. In a conventional classroom, a teacher has to teach a group of learners within a limited period. Although teachers use different pedagogical strategies to address learner diversity, it can be difficult to provide continuous individualized instruction and feedback to every student. Artificial Intelligence provides an opportunity to address this challenge by supporting personalized and adaptive learning.

AI refers to computational systems capable of performing tasks that normally require aspects of human intelligence, such as pattern recognition, prediction, language processing, reasoning, and decision-making. In mathematics education, AI can analyse students' responses and

learning patterns and use this information to provide differentiated learning experiences.

The significance of AI is therefore not merely technological. Its educational value lies in its potential to help teachers understand individual learners and provide appropriate support at the appropriate time.

2. Individual Differences in Mathematics Learning

Individual differences refer to variations among learners in characteristics that influence learning. In mathematics, these differences may occur in several areas:

- Prior mathematical knowledge and prerequisite skills
- Learning pace and cognitive readiness
- Mathematical reasoning and problem-solving ability
- Spatial and numerical understanding
- Learning interests and motivation
- Confidence and attitudes towards mathematics
- Language proficiency
- Ability to identify and correct errors
- Preferred ways of representing mathematical ideas

For example, while learning algebra, one student may have difficulty understanding variables, another may struggle with equations, and another may require challenging applications. Giving the same worksheet to all three students may not address their actual learning needs.

Consequently, mathematics instruction needs to move towards approaches that recognize learner diversity while maintaining common learning objectives.

3. AI and Personalized Mathematics Learning

Personalized learning aims to provide learning experiences that respond to individual learners' needs, abilities, progress, and interests. AI can strengthen personalized learning by continuously analysing learner data and adapting instructional content.

An AI-supported mathematics learning system can identify whether a student has mastered a particular concept. If the learner demonstrates difficulty with fractions, for example, the system may provide prerequisite activities involving equivalent fractions before moving to more complex operations.

Similarly, an advanced learner can receive challenging problems involving mathematical reasoning and applications instead of repeatedly practising already-mastered skills.

Thus, AI can support a learning pathway in which the content, difficulty, pace, practice and feedback are adjusted according to learner needs.

4. Role of AI in Addressing Individual Differences

4.1 Identification of Learning Gaps

One of the important contributions of Artificial Intelligence (AI) in mathematics learning is its ability to identify individual students' learning gaps and misconceptions. In a traditional classroom, teachers generally depend on classroom observation, assignments, tests, and students' responses to identify difficulties. However, AI-supported learning systems can analyse a much larger range of learner responses, including patterns of incorrect answers, repeated mistakes, time taken to solve problems, and performance across different mathematical concepts. Based on this analysis, AI can identify specific areas in which a

learner requires additional support.

For example, if a student repeatedly makes errors while adding fractions with unlike denominators, an AI system can recognize the recurring misconception and recommend activities related to equivalent fractions and finding common denominators before progressing to more complex operations. Similarly, difficulties in algebraic manipulation or geometry can be detected through patterns of errors. Such diagnostic information enables teachers to provide targeted remedial instruction, differentiated learning activities, and timely intervention according to each learner's needs.

4.2 Adaptive Learning

AI can dynamically adjust the level of difficulty of mathematical tasks. When a learner demonstrates mastery, the system can gradually introduce more complex problems. When the learner struggles, it can provide simpler examples, hints, visual representations, or additional practice.

Adaptive learning therefore prevents two common problems: advanced learners becoming bored because of insufficient challenge and struggling learners becoming frustrated because the content is too difficult.

4.3 Individualized Feedback

Feedback is essential in mathematics because students need to understand not only whether an answer is correct but also why an error occurred.

AI-based systems can provide immediate feedback and hints. For example, rather than simply stating that an algebraic answer is incorrect, an AI tutor can prompt the learner to check the operation performed in a particular step.

However, teacher verification remains important because AI-generated explanations may sometimes be incomplete or incorrect.

4.4 Supporting Different Learning Paces

Students do not learn mathematical concepts at the same speed. AI-supported platforms can allow learners to revisit concepts, practise additional problems, or progress to advanced content according to their individual readiness.

This flexibility is particularly useful in mixed-ability classrooms.

4.5 Supporting Mathematical Problem-Solving

AI can generate mathematical problems at different levels of complexity. It can provide routine exercises for foundational learning and non-routine problems for students who require higher levels of challenge.

AI can also encourage students to consider alternative solution methods. This can promote mathematical reasoning rather than mere memorization of procedures.

4.6 Learning Analytics

AI can analyse large amounts of learning data, including response patterns, time spent on activities, frequency of errors, and progress across concepts.

Teachers can use such information to answer questions such as:

- Which students require additional support?
- Which mathematical concepts are difficult for the class?
- What types of errors are common?

- Which students are ready for enrichment activities?

Learning analytics can therefore support evidence-based instructional decisions.

4.7 Supporting Differentiated Instruction

AI can assist teachers in preparing differentiated learning materials. For example, a teacher may create three levels of activities:

Level 1: foundational practice

Level 2: application and problem-solving

Level 3: higher-order and challenging problems

AI can help generate variations of questions while the teacher determines their mathematical validity and pedagogical suitability.

5. AI and Inclusive Mathematics Education

AI has the potential to make mathematics learning more inclusive. Learners who require additional practice can receive individualized support without being singled out in front of their peers. Students can also access explanations in different forms, such as text, diagrams, examples, and step-by-step guidance.

For multilingual classrooms, AI-supported tools may also assist with language-related barriers by providing explanations in familiar languages. However, the quality and accuracy of translations must be carefully monitored by teachers.

AI can therefore support the principle that different learners may need different pathways to achieve meaningful mathematical learning.

6. Changing Role of the Mathematics Teacher

The introduction of AI does not reduce the importance of teachers. Instead, it changes and potentially expands their role.

The mathematics teacher becomes:

- A **learning facilitator** who guides students in using AI meaningfully.
- A **diagnostician** who interprets AI-generated learning data.
- A **content expert** who verifies mathematical accuracy.
- A **mentor** who supports motivation, confidence and persistence.
- A **designer of learning experiences** who combines technology with appropriate pedagogy.
- An ethical guide who teaches students responsible use of AI.

For B.Ed. teacher education, this transformation is particularly important. Future teachers need technological competence together with pedagogical and mathematical knowledge. AI literacy should therefore become part of professional development for mathematics teachers.

7. Challenges and Concerns

Despite its potential, AI-based mathematics learning has several challenges.

Digital inequality: Not all students have equal access to devices, reliable internet, or AI-based learning platforms.

Accuracy: AI systems can occasionally generate incorrect mathematical solutions or misleading explanations. Teacher verification is therefore essential.

Overdependence: If students depend excessively on AI for solving problems, their independent reasoning and persistence may decline.

Data privacy: Student learning data must be collected, stored, and used responsibly.

Reduced human interaction: Mathematics learning involves communication, collaboration, questioning, and emotional support. Technology cannot completely replace these human dimensions.

Teacher preparedness: Teachers need appropriate training to select, evaluate, and integrate AI tools effectively.

Therefore, AI should be viewed as a supportive pedagogical tool rather than a replacement for teachers or students own mathematical thinking.

8. A Proposed AI-Supported Model for Mathematics Learning

A simple framework for AI-supported personalized mathematics learning can be represented through five stages:

Diagnose → Personalize → Learn → Receive Feedback → Reflect

First, AI-supported assessment identifies the learner's existing knowledge and misconceptions. Second, learning activities are personalized according to individual needs. Third, the learner engages with mathematical concepts and problems. Fourth, AI provides immediate feedback and recommendations. Finally, the learner reflects on the solution process, errors, and learning progress.

The teacher remains involved throughout all five stages by interpreting learner information, validating AI recommendations, providing human guidance, and designing meaningful mathematical experiences.

This model combines the strengths of AI with the professional judgement of teachers.

9. Implications for B.Ed. Teacher Education

Teacher education institutions have an important role in preparing future teachers for AI-supported classrooms. B.Ed. programmes should provide opportunities for teacher trainees to:

1. Understand the educational possibilities and limitations of AI.
2. Develop AI literacy and digital competence.
3. Design personalized mathematics activities.
4. Interpret learning analytics.
5. Evaluate the mathematical accuracy of AI-generated content.
6. Use AI to prepare differentiated worksheets and assessments.
7. Develop students' critical thinking and responsible AI use.
8. Maintain meaningful teacher-student interaction.

Teacher trainees should understand that effective AI integration requires the combination of content knowledge, pedagogical knowledge and technological knowledge.

10. Conclusion

Individual differences are a fundamental reality of mathematics classrooms. A uniform teaching approach cannot always meet the needs of learners who differ in prior knowledge, learning pace, reasoning ability, confidence, motivation, and problem-solving skills. Artificial Intelligence offers significant possibilities for addressing these differences through personalized learning, adaptive instruction, immediate feedback, learning analytics, differentiated practice, and intelligent tutoring.

However, the success of AI in mathematics education depends not on technology alone but on

thoughtful pedagogical integration. Teachers must remain central in interpreting learner needs, verifying mathematical content, encouraging reasoning, supporting motivation, and developing responsible learning habits.

For B.Ed. faculty and teacher educators, the key challenge is therefore not simply to teach future teachers how to use AI, but to help them understand when, why, and how AI can be used pedagogically to improve mathematics learning.

AI has the potential to move mathematics education from a predominantly one-size-fits-all model towards a more responsive and learner-centred approach. When combined with effective teaching, human interaction, mathematical reasoning, and reflective learning, AI can become a powerful tool for creating more inclusive and personalized mathematics classrooms.

Abstract

This study examined the effectiveness of the constructivist method of teaching, relative to the conventional method, on the Mathematics achievement of IXth standard students, and the interaction of teaching method with gender and locale on gain scores. A pre-test–post-test experimental design was used with an Experimental group (n=30, constructivist method) and a Control group (n=30, conventional method). Independent- and paired-samples t-tests, a two-way ANOVA with Tukey's post-hoc test, and ANCOVA were applied ($p < 0.05$). The groups were equivalent at pre-test, but the Experimental group scored significantly higher at post-test ($t = 9.67$, $p < .001$). A significant Group × Gender interaction on gain scores ($F=9.13$, $p = .004$) showed girls in the Experimental group gained the most. The findings support wider use of constructivist strategies in secondary Mathematics teaching, with attention to gender-based differences in response.

Keywords: Constructivism, Conventional Method, Academic Achievement, Mathematics, Secondary Students.

1. Introduction:

Mathematics achievement at the secondary level is strongly shaped by the instructional method used in the classroom. conventional, lecture-based teaching relies on demonstration, repetition and drill and has been associated with weak conceptual understanding despite adequate procedural fluency (Naz & Qayyum, 2025). constructivist pedagogy, by contrast, positions the learner as an active builder of knowledge through discovery, discussion and engagement with real-life problems, and has been reported to produce significantly larger achievement gains than conventional instruction in comparable secondary-level settings (Banu & Mahmood, 2019; Akendita et al., 2024). In India, the National Curriculum Framework (NCERT, 2005) has explicitly recommended such a shift toward learner-centred, constructivist classroom practice. Because IXth standard students are at a stage where abstract algebraic reasoning begins to consolidate, the method used to teach Mathematics at this level has particular significance for both immediate achievement and long-term conceptual growth. this study compares the constructivist and conventional methods using a pretest–posttest design and further examines whether the effect of method differs by gender and locale.

2. Need and Importance of the Study:

The National Curriculum Framework (NCF,2005) has endorsed constructivist pedagogy at

the policy level, conventional lecture-and-drill instruction continues to dominate secondary Mathematics classrooms in practice. existing studies confirm that constructivist instruction generally improves Mathematics achievement (Banu & Mahmood, 2019; Naz & Qayyum, 2025) and that this benefit may be reinforced through improved student self-efficacy (Akendita et al., 2024), but comparatively few studies examine whether this advantage holds equally for boys and girls or for rural and urban students, within the same sample. Evidence on such moderating factors matters for teachers and curriculum planners, since a method that benefits one subgroup may need adaptation to benefit another equally. this study addresses that gap by evaluating both the overall effect of the constructivist method and its interaction with gender and locale on gain scores.

3. Review of Literature:

Banu and Mahmood (2019) compared a constructivist 5E approach with the conventional transmission method among 64 Class IX students in Warangal, India, in a pretest–posttest design. The groups were equivalent at pretest, but the constructivist group scored significantly higher at posttest, with a large effect size, indicating substantially greater improvement in Mathematics achievement than conventional teaching.

Akendita et al. (2024) used structural equation modelling with 260 senior high school students in Ghana and found that socio-constructivist Mathematics teaching had a significant direct positive effect on achievement, partially mediated by students' mathematics self-efficacy suggesting constructivist teaching also works by building students' confidence in their own mathematical ability.

Naz and Qayyum (2025) compared a problem-solving, constructivist-aligned strategy with conventional lecture instruction among 300 Grade 9 students in Pakistan. The experimental group's mean score rose by 18.6 points from pretest to posttest, against a 4.7-point rise in the control group, with the posttest difference highly significant.

Across these studies, from India, Ghana, and Pakistan, constructivist or constructivist-aligned methods consistently produced significantly greater achievement gains than conventional instruction, with groups typically equivalent before treatment. Few of these studies, however, examine whether this advantage differs by gender or locale within the same sample — the gap the present study addresses.

4. Objectives of the Study:

1. To compare the pre-test and post-test academic achievement in Mathematics of IXth standard students taught through the constructivist method (Experimental group) and the conventional method (Control group).
2. To study the interaction effect of teaching method (constructivist vs. conventional) with gender (boys, girls) and locale (rural, urban) on the gain in academic achievement in Mathematics of IXth standard students.

5. Hypotheses of the Study:

1. There is no significant difference between the Experimental group (constructivist method) and the Control group (conventional method) with respect to pre-test and post-test academic achievement in Mathematics of IXth standard students.

2. There is no significant interaction effect of teaching method (Experimental group and Control group) with gender (Boys, Girls) and locale (Rural, Urban) on the gain in academic achievement in Mathematics of IXth standard students from pre-test to post-test.

6. Methodology:

Research Design:

A Quantitative, Pre-Test–Post-Test Experimental Design was used, with an Experimental group taught through the constructivist method and a Control group taught through the conventional method.

Sample: 60 IXth standard students (30 Experimental, 30 Control), each group comprising 15 boys/ 15 girls and 15 rural/15 urban students.

Statistical techniques Used: Independent- and paired-samples t-tests (Objective 1); two-way (2 × 2) ANOVA with Tukey's post-hoc test and ANCOVA (Objective 2). SPSS v.23.0 was used.

7. Results And Discussion:

7.1 Post-test Comparison between Experimental and Control Groups

The Experimental and Control groups did not differ significantly at pre-test ($t = 0.11$, $df = 58$, $p = .915$), confirming baseline equivalence. Table 1 presents the posttest comparison.

Table 1. Independent-samples t-test comparing posttest Mathematics achievement between the Experimental and Control groups.

Groups	n	Mean	SD	t-value	df	P-value	Sign
Experimental group	30	44.70	13.55				
Control group	30	18.93	5.39	9.6738	58	0.0001	S

The Experimental group ($M = 44.70$, $SD = 13.55$) scored significantly higher than the Control group ($M = 18.93$, $SD = 5.39$) at post-test, $t(58) = 9.67$, $p < .001$. H01 is therefore rejected: the constructivist method produced significantly greater Mathematics achievement than the conventional method, consistent with Banu and Mahmood (2019) and Naz and Qayyum (2025).

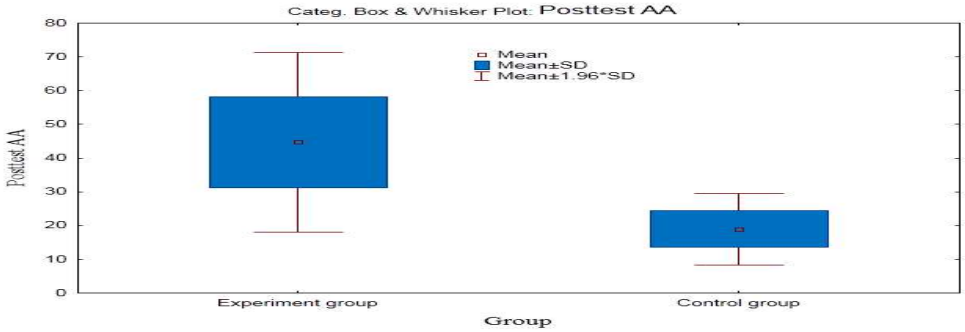

Figure 1. Posttest Mathematics achievement of the Experimental and Control groups.

7.2 Interaction of Teaching Method with Gender on Gain Scores

A two-way ANOVA (Table 2) tested the interaction of teaching method with gender on

gain scores.

Table 2. Two-way ANOVA: teaching method × gender on gain scores.

Source of variation	SS	df	MS	F	p	Signi.
Group	9856.02	1	9856.02	188.9677	0.0001	S
Gender	558.15	1	558.15	10.7013	0.0018	S
Group × Gender	476.02	1	476.02	9.1266	0.0038	S
Error	2920.80	56	52.16			
Total	13810.98	59				

The main effects of Group, $F(1, 56) = 188.97$, $p < .001$, and Gender, $F(1, 56) = 10.70$, $p = .002$, were significant, as was the Group × Gender interaction, $F(1, 56) = 9.13$, $p = .004$. H02 is therefore rejected. Tukey's post-hoc test showed girls in the Experimental group ($M = 33.87$, $SD = 11.86$) gained significantly more than boys in the Experimental group ($M = 22.13$, $SD = 8.01$), $p = .0004$, while Control-group boys and girls did not differ ($p = .998$). This partial gender-moderation of the constructivist advantage echoes the mediating role of student factors such as self-efficacy reported by Akendita et al. (2024).

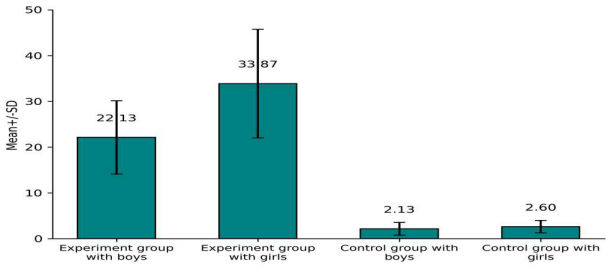

Figure 2. Interaction of teaching method with gender on gain scores.

8. Findings:

1. No significant difference between the Experimental and Control groups in pretest Mathematics achievement ($t = 0.11$, $df = 58$, $p = .915$), confirming baseline equivalence.
2. A significant difference between the Experimental and Control groups in posttest Mathematics achievement, with the Experimental group significantly higher ($t = 9.67$, $df = 58$, $p < .001$).
3. A significant main effect of Group on gain scores from pre-test to post-test, $F(1, 56) = 188.97$, $p < .001$.
4. A significant main effect of Gender on gain scores, $F(1, 56) = 10.70$, $p = .002$.
5. A significant Group × Gender interaction on gain scores, $F(1, 56) = 9.13$, $p = .004$, with girls in the Experimental group showing the greatest gain ($M = 33.87$) compared with boys in the Experimental group ($M = 22.13$).
6. Within the Control group, no significant difference in gain scores between boys and girls ($p = 998$), indicating the gender-based difference was specific to the constructivist condition.

9. Educational Implications and Recommendations:

- Introduce conceptually demanding topics through constructivist activities (discovery, discussion, real-life problems) before consolidating with conventional drill ahead of examinations.
- Train teachers in facilitative questioning and allow a transition period before formal assessment when shifting from conventional to constructivist practice.
- Broaden assessment to include open-ended, project-based tasks alongside timed, procedure-based tests.
- Since the constructivist advantage was larger for girls, monitor and adapt implementation to ensure boys benefit equally, e.g., through differentiated grouping.
- Phase the balance of methods across the year — constructivist-led early on for conceptual depth, conventional drill closer to examinations for speed and accuracy.

10. Conclusion:

The study concluded that constructivist teaching methods were more effective than conventional teaching in improving the mathematics achievement of IXth standard students. Since both groups were statistically equivalent before the intervention, the significantly higher posttest achievement of the Experimental group can be attributed to the constructivist approach. The findings also indicated that girls benefited more from constructivist teaching than boys, highlighting the need for teachers to ensure balanced participation and support for all learners. These results reinforce the value of learner-centred strategies such as guided discovery, collaborative learning, discussion, and real-life problem-solving in secondary mathematics classrooms. However, the study was limited by its small sample size and single-school setting, which restrict the generalizability of the findings. Future research should involve larger and more diverse samples, longer intervention periods, and additional variables such as prior achievement, socio-economic status, teacher characteristics, and mathematics self-efficacy to provide a more comprehensive understanding of the effectiveness of constructivist teaching in mathematics education.

Abstract

Mathematics achievement is a key indicator of academic success, and improving it through innovative teaching approaches remains a major educational priority. This study examined the effectiveness of Blended (Hybrid) Teaching on the Mathematics achievement of Grade 5 students in a Government Higher Primary School in Vijayapura district, Karnataka. A pre-test–post-test experimental design was adopted with 60 students, equally divided into an Experimental Group (n=30) taught through Blended Teaching and a Control Group (n=30) taught through the conventional method. Statistical analysis using paired-samples and independent-samples t-tests revealed significant improvement in Mathematics achievement in both groups from pre-test to post-test (p< .001). While no significant difference was found between the groups at the pre-test stage, the Experimental Group achieved significantly higher post-test scores than the Control Group t(58)=2.70, p=.009. Although the Experimental Group demonstrated a greater mean gain in achievement, the difference in gain scores was not statistically significant. The findings indicate that Blended (Hybrid) Teaching is more effective than conventional teaching in enhancing Mathematics achievement among primary school students and supports its integration into elementary Mathematics classrooms.

Keywords: *Blended Learning, Hybrid Teaching, Mathematics achievement, primary school students, experimental study.*

Introduction:

Mathematics is a fundamental subject that develops logical reasoning, critical thinking, problem-solving and decision-making skills, while providing the foundation for learning science, engineering and technology (NCTM, 2014). However, many students face difficulties in mathematics due to traditional teacher-centred teaching methods and limited opportunities for active learning (Hattie, 2023). With the rapid advancement of Information and Communication Technology (ICT), Blended (Hybrid) Teaching, which combines face-to-face instruction with technology-supported learning, has emerged as an effective approach to enhance students' engagement and academic achievement (Graham, 2021; Hrastinski, 2019). furthermore, the National Education Policy (NEP) 2020 advocates the integration of technology into classroom instruction to improve educational quality and promote competency-based learning (Government of India, 2020). Therefore, the present study examines the effectiveness of Blended (Hybrid) Teaching in improving the Mathematics

Achievement of primary school students.

Review of Literature:

Egara and Mosimege (2024) investigated the effect of a blended learning approach on secondary school learners' Mathematics achievement and retention using a non-equivalent control-group, pre-test–post-test quasi-experimental design, with participants drawn from two secondary schools and divided into experimental and control groups using simple random sampling. The study found that students in the experimental group demonstrated significantly higher Mathematics achievement and better retention than students taught through conventional instruction and the authors concluded that blended learning promotes active participation, collaborative learning and improved academic performance in Mathematics (Egara & Mosimege, 2024).

Kumar, Gangwar, and Mehrotra (2023) carried out a meta-analytical study examining the effectiveness of the blended learning approach on the academic achievement of learners, synthesising findings from studies published between 2015 and 2021 that were identified through purposive sampling. The meta-analysis reported an overall positive and substantial effect of blended learning on academic achievement across the studies reviewed, and the authors concluded that blended learning is an effective pedagogical approach that supports meaningful learning and improves educational outcomes (Kumar et al., 2023).

Makkar and Sharma (2022) conducted an experimental study titled "Effect of Blended Learning on Academic Achievement in Mathematics among IX Grade Students," involving 65 students of a school in Amritsar, divided into an experimental group (n =33) and a control group (n=32) taught the same geometry content over a period of weeks. Although the two groups did not differ significantly on the pre-test, the experimental group achieved a significantly higher post-test mean (18.78) than the control group (15.34), $t(63) = 2.32$, $p < .05$, leading the authors to conclude that blended learning is an effective instructional approach for improving Mathematics achievement (Makkar & Sharma, 2022, pp. 1352–1353).

Need and Importance of the Study:

Mathematics achievement is a key indicator of students' academic success and cognitive development. Recent international evidence has shown a decline in Mathematics performance, highlighting the need for effective and innovative teaching approaches (OECD, 2023). Blended (Hybrid) Teaching, which combines face-to-face instruction with digital learning resources, enhances student engagement, provides timely feedback and encourages independent learning, although effective teacher guidance is essential for successful implementation (Rasheed et al., 2020). The present study is significant as it provides empirical evidence on the effectiveness of Blended (Hybrid) Teaching in improving Mathematics Achievement among primary school students in a government school. The findings will be useful for teachers, teacher educators, school administrators and policymakers in promoting technology-integrated Mathematics instruction in line with the recommendations of the National Education Policy (NEP) 2020.

Objectives of the Study:

1. To study the difference between the pre-test and post-test Mathematics Achievement scores of higher primary school students in the Experimental Group.

2. To study the difference between the pre-test and post-test Mathematics Achievement scores of higher primary school students in the Control Group.
3. To compare the Mathematics Achievement scores of higher primary school students between the Experimental Group and the Control Group at pre-test and post-test.

Hypothesis of the Study:

1. There is no significant difference between the pre-test and post-test Mathematics Achievement scores of higher primary school students in the Experimental Group.
2. There is no significant difference between the pre-test and post-test Mathematics Achievement scores of higher primary school students in the Control Group.
3. There is no significant difference between the Experimental Group and the Control Group with respect to pre-test and post-test Mathematics Achievement scores among higher primary school students.

Methodology:

Research Method:

The present study employed the **Experimental Method** of research.

Research Design:

A **two-group pre-test–post-test experimental design** was adopted, in which both groups were assessed before and after the instructional intervention, the Experimental Group receiving the Hybrid Teaching Method and the Control Group receiving the Traditional Method, as summarized in Table 1.

Table 1. Pre-test–Post-test Two-Group Experimental Design

Group	Pre-test	Treatment	Post-test
Control Group	✓	Traditional Method	✓
Experimental Group	✓	Hybrid Teaching Method	✓

Sample of the Study:

The sample for the present study consisted of 60 Grade 5th students studying Mathematics in a Government Higher Primary School, Shanti Nagar, Toravi, Vijayapura Taluk, Vijayapura District, Karnataka. The students were divided into two equivalent groups of 30 each, namely the Experimental Group and the Control Group with equal representation of gender in each group (15 boys and 15 girls), giving a total sample of 30 boys and 30 girls. The Experimental Group was exposed to the Hybrid Teaching Programme developed by the investigator, while the Control Group received instruction through the conventional method with allocation carried out to ensure equivalence with respect to academic background and learning characteristics.

Table 2. Distribution of the Sample by Group and Gender:

Group	Boys	Girls	Total
Control Group (Traditional Method)	15	15	30
Experimental Group (Hybrid Teaching)	15	15	30
Total	**30**	**30**	**60**

Sampling Procedure and Technique:

A Purposive Sampling Technique was employed to select the Government Higher

Primary School as a school suitable for implementing the Hybrid Teaching Programme. From this school, a sample of 60 Grade 5th students was selected and assigned to the Experimental and Control Groups using **Simple Random Sampling,** with **Stratified Representation** by Gender applied to ensure equal participation of boys and girls in both groups, based on their prior academic performance in Mathematics.

Data Analysis

1.Objective 1: To study the difference between the pre-test and post-test Mathematics Achievement scores of higher primary school students in the Experimental Group.

Null Hypothesis.1:There is no significant difference between the pre-test and post-test Mathematics Achievement scores of higher primary school students in the Experimental Group.

Alternative Hypothesis.1: There is a significant difference between the pre-test and post-test Mathematics Achievement scores of higher primary school students in the Experimental Group.

Table 3. Mean, SD, and Paired t-test for Pre-test and Post-test Mathematics Achievement Scores Experimental Group (N = 30)

Test	N	Mean	SD	Mean Diff.	df	Calc. t-value	Table value (0.05)	Significance
Pre-test	30	13.43	1.65					
Post-test	30	16.47	1.14	3.03	29	10.20	2.045	Significant ($p < .001$)

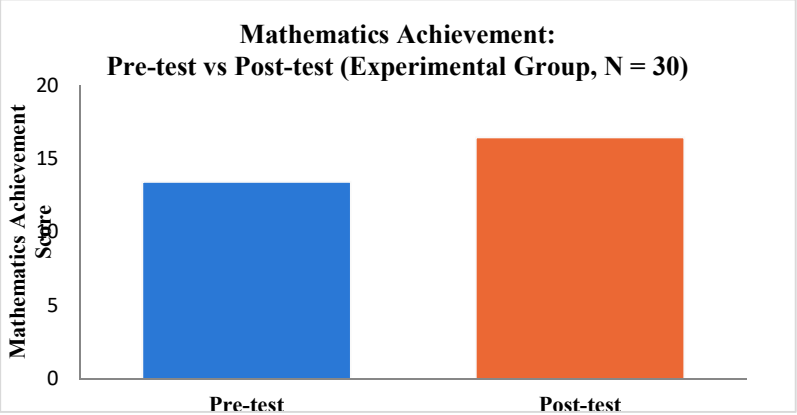

Table 3 shows the Experimental Group's Mathematics Achievement scores rose from a pre-test mean of 13.43 (SD = 1.65) to a post-test mean of 16.47 (SD = 1.14), a gain of 3.03 points, with less variability among students after the intervention.

A paired-samples t-test confirmed this gain is statistically significant: $t(29) = 10.20$, exceeding the critical value of 2.045 at $p < .05$, and significant even at $p < .001$. Hypothesis 1 (no significant difference) is therefore rejected, and the alternative hypothesis is **accepted.**

This confirms a reliable improvement within the Experimental Group; the effect size was large, Cohen's $d_r = 3.03 / 1.63 = 1.86$ (using the SD of the difference scores reported in Table 5), though as a single-group pre-post design it cannot on its own attribute the gain specifically

to the treatment, a question addressed through direct comparison with the Control Group under Objective 3.

2.Objective 2: To study the difference between the pre-test and post-test Mathematics Achievement scores of higher primary school students in the Control Group.

Null Hypothesis.2: There is no significant difference between the pre-test and post-test Mathematics Achievement scores of higher primary school students in the Control Group.

Alternative Hypothesis.2: There is a significant difference between the pre-test and post-test Mathematics Achievement scores of higher primary school students in the Control Group.

Table 4. Mean, SD, and Paired t-test for Pre-test and Post-test Mathematics Achievement Scores Control Group (N = 30)

Test	N	Mean	SD	Mean Diff.	df	Calc. t-value	Table value (0.05)	Significance
Pre-test	30	12.93	1.28					
Post-test	30	15.67	1.15	2.73	29	10.60	2.045	Significant ($p < .001$)

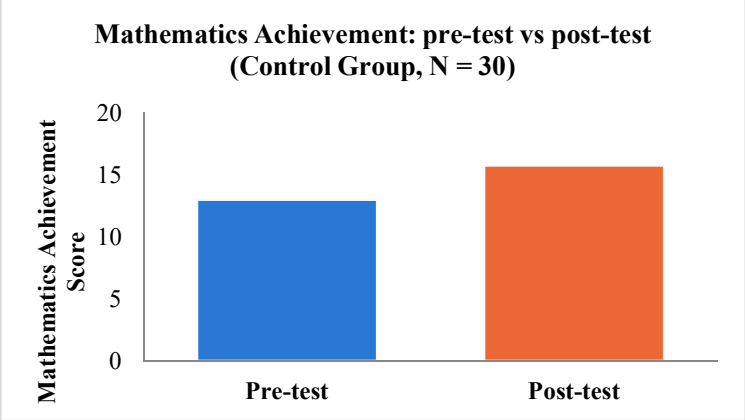

Table 4 shows the Control Group's Mathematics Achievement scores also rose, from a pre-test mean of 12.93 (SD = 1.28) to a post-test mean of 15.67 (SD = 1.15), a gain of 2.73 points. A paired t-test confirmed this gain is significant: $t(29) = 10.60$, exceeding the critical value of 2.045 at $p < .05$, and significant at $p < .001$. This gain also reflected a large effect size, Cohen's $d_r = 2.73 / 1.41 = 1.94$ (Table 5). Hypothesis 2 (no significant difference) is therefore rejected, and the alternative hypothesis is **accepted.**

Notably, the Control Group's improvement (2.73 points) was numerically similar to that of the Experimental Group (3.03 points; Table 3), and both within-group changes were statistically significant. Such gains in a control condition are not unexpected, since regular classroom instruction, repeated exposure to the same test, or maturation over the intervention period can independently produce genuine pre-post improvement even in the absence of an experimental treatment. Consequently, the more direct test of the treatment's effectiveness lies in comparing the Experimental and Control Groups' post-test scores and gain scores against each other, rather than relying on each group's within-group significance alone; this comparison is addressed under Objective 3 below.

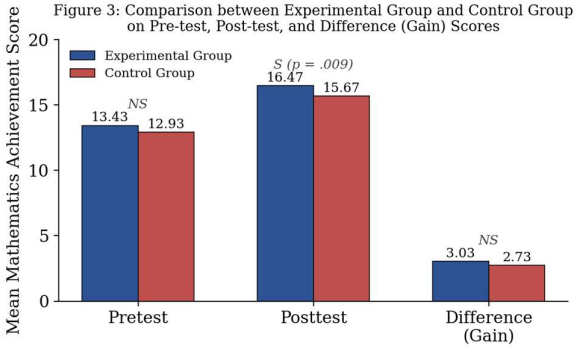
3.Objective 3: To compare the Mathematics Achievement scores of higher primary school students between the Experimental Group and the Control Group at pre-test and post-test.

Null Hypothesis 3*: There is no significant difference between the Experimental Group and the Control Group with respect to pre-test and post-test Mathematics Achievement scores among higher primary school students.*

Alternative Hypothesis.3: *There is a significant difference between the Experimental Group and the Control Group with respect to pre-test and post-test Mathematics Achievement scores among higher primary school students.*

Table 5. Results of Independent t-test (Unpaired t-test) between Experimental Group and Control Group with respect to Pre-test and Post-test Mathematics Achievement Scores among Higher Primary School Students

Time	Groups	n	Mean	SD	SE	t-value	p-value
Pre-test	Experimental Group	30	13.43	1.65	0.30		
	Control Group	30	12.93	1.28	0.23	1.3075	0.1962, NS
Post-test	Experimental Group	30	16.47	1.14	0.21		
	Control Group	30	15.67	1.15	0.21	2.7043	0.0090, S
Difference	Experimental Group	30	3.03	1.63	0.30		
	Control Group	30	2.73	1.41	0.26	0.7620	0.4491, NS



From the results of Table 5 and Figure 1, it is observed that:

The results of Table 5 and Figure 1 indicate that there was no significant difference between the Experimental and Control Groups in their pre-test Mathematics Achievement scores (t = 1.3075, p = 0.1962), confirming that both groups were comparable before the intervention. However, a significant difference was observed in the post-test Mathematics Achievement scores (t = 2.7043, p = 0.0090), with the Experimental Group performing significantly better than the Control Group. Although the Experimental Group showed a slightly higher mean gain score (3.03) than the Control Group (2.73), the difference in gain scores was not statistically significant (t = 0.7620, p = 0.4491). Thus, the findings indicate that Blended (Hybrid) Teaching resulted in significantly higher post-test Mathematics Achievement, while the difference in improvement (gain scores) between the two groups was not statistically significant. The corresponding between-group effect sizes (Cohen's d, pooled

SD) were small at pre-test (d = 0.34), medium to large at post-test (d = 0.70), and small for the gain-score comparison (d = 0.20), consistent with the pattern of statistical significance reported above.

Discussions:

The present study found that the Experimental Group showed a statistically significant improvement in Mathematics Achievement after the implementation of Blended (Hybrid) Teaching. This finding is in agreement with Makkar and Sharma (2022), Egara and Mosimege (2024), and the meta-analysis by Kumar, Gangwar, and Mehrotra (2023), all of whom reported that blended learning significantly enhances students' academic achievement compared to conventional teaching methods.

The study also revealed that the Control Group improved significantly in Mathematics Achievement, although the difference in gain scores between the Experimental and Control Groups was not statistically significant. This may be because the Control Group also received systematic and well-planned conventional classroom instruction throughout the intervention period. As noted by Hattie (2023), effective classroom teaching itself can produce substantial learning gains, thereby reducing the observable difference between instructional approaches.

Nevertheless, the Experimental Group recorded a higher mean gain than the Control Group, supporting the views of Graham (2021) and Hrastinski (2019) that Blended (Hybrid) Teaching integrates face-to-face instruction with technology-supported learning, providing greater flexibility, immediate feedback, and opportunities for self-paced practice. These features are likely to enhance students' understanding and contribute to improved Mathematics Achievement, even when the difference in gain scores is not statistically significant.

Findings:

- There was a statistically significant, positive difference between the pre-test and post-test Mathematics Achievement scores of the Experimental Group, $t(29) = 10.20$, $p < .001$; the null hypothesis H_{01} is rejected and the alternative hypothesis H_{11} ("there is a significant difference…") is **accepted.**
- There was a statistically significant, positive difference between the pre-test and post-test Mathematics Achievement scores of the Control Group, $t(29) = 10.60$, $p < .001$; the null hypothesis H_{02} is rejected and the alternative hypothesis H_{12} ("there is a significant difference…") is **accepted.**
- There was no statistically significant difference between the Experimental Group and the Control Group with respect to pre-test Mathematics Achievement scores, $t(58) = 1.3075$, $p = .1962$; the null hypothesis H_{03} is accepted for this comparison, confirming that the two groups were equivalent at baseline.
- There was a statistically significant, positive difference between the Experimental Group and the Control Group with respect to post-test Mathematics Achievement scores, $t(58) = 2.7043$, $p = .0090$; the null hypothesis H_{03} is rejected and the alternative hypothesis H_{13} is accepted for this comparison, confirming that the Experimental Group achieved significantly higher Mathematics scores than the Control Group after the intervention.

- The between-group difference in gain (difference) scores was not statistically significant, $t(58) = 0.7620$, $p = .4491$; for this specific comparison the null hypothesis H_{03} is accepted, even though the Experimental Group's mean gain (3.03 marks) was numerically larger than the Control Group's (2.73 marks).
- Both instructional methods produced large practical effects on their own within-group gains (Cohen's $d > 1.8$), and the Experimental Group additionally achieved a significantly higher absolute post-test score than the Control Group, indicating an overall positive effect of Blended (Hybrid) Teaching on Grade 5 Mathematics achievement.

Suggestions:

- Teachers may adopt Blended (Hybrid) Teaching as a viable supplementary strategy for Mathematics instruction at the primary stage, given the significant and educationally large gain it produced.
- Future studies should use larger and multi-school samples to increase the statistical power available for detecting between-group differences in gain scores.
- Longer intervention periods and delayed post-tests are recommended to examine whether the achievement gains associated with Blended Teaching are sustained over time and translate into improved retention, as suggested by Egara and Mosimege (2024).
- School administrators should ensure adequate digital infrastructure and teacher training before scaling up Blended Teaching programmes in government primary schools, given the documented implementation challenges of the online component (Rasheed et al., 2020).
- Subsequent research should examine potential moderating variables, such as gender, prior achievement level, and access to digital devices at home, in explaining variation in students' response to Blended Teaching.

Conclusion:

The present study investigated the effectiveness of Blended (Hybrid) Teaching on the Mathematics Achievement of Grade 5 students using a pre-test–post-test experimental design. The findings revealed that both the Experimental and Control Groups showed significant improvement in Mathematics Achievement after the intervention. The two groups were statistically equivalent at the pre-test, confirming their initial comparability. However, the Experimental Group achieved significantly higher post-test scores than the Control Group, demonstrating the positive impact of Blended (Hybrid) Teaching. Although the difference in gain scores between the groups was not statistically significant, the Experimental Group recorded a higher mean gain, indicating the potential advantage of the blended approach. Overall, the findings support the effectiveness of Blended (Hybrid) Teaching in enhancing Mathematics Achievement among primary school students and recommend its wider integration into Mathematics classrooms in accordance with the objectives of the National Education Policy (NEP) 2020. Further studies with larger samples are recommended to validate these findings.

ARTIFICIAL INTELLIGENCE AND THE FUTURE OF PEDAGOGY: BUILDING ADAPTIVE LEARNING ENVIRONMENTS

Dr.Kowshik.M.C
Asst. Professor, B.E.A College of Education, Davanagere, Karnataka. INDIA Pin: 577004
E-mail: koushikmc1976@gmail.com

Abstract

Artificial Intelligence (AI) is reshaping pedagogy by enabling learning environments that adapt to the pace, preferences, and needs of individual learners. This conceptual thematic paper examines how AI-enabled adaptive learning intersects with established pedagogical theory to reimagine teaching and learning for a digitally mediated era. Drawing on recent scholarship in AI in Education (AIED), the paper synthesizes theoretical foundations, including constructivism, connectivism, self-regulated learning, and Universal Design for Learning, with emerging applications such as intelligent tutoring systems, learning analytics, and generative AI. It examines how these developments support personalized learning pathways, dynamic curriculum adaptation, and inclusive practice, while critically weighing opportunities against persistent challenges of algorithmic bias, data privacy, digital divides, and teacher preparedness. Situating the discussion within global policy frameworks such as UNESCO's guidance on generative AI and India's National Education Policy 2020, the paper argues that the future of pedagogy lies not in automation but in human-AI collaboration grounded in ethical governance and educator agency. The paper contributes a synthesized conceptual framework for adaptive learning ecosystems and offers implications for teachers, institutions, and policymakers navigating AI-enabled educational transformation.

Keywords: *Adaptive learning; Artificial intelligence in education; Educational Technology; Generative AI; Human-centered pedagogy; Learning analytics; Personalized learning.*

Introduction

Education systems worldwide are undergoing a period of sustained technological transformation, and Artificial Intelligence (AI) has emerged as one of its most consequential drivers. Over the past decade, AI in Education (AIED) has evolved from isolated intelligent tutoring experiments into a broad ecosystem of learning analytics platforms, adaptive content engines, and, more recently, generative AI tools capable of producing human-like text, feedback, and instructional material (Zawacki-Richter et al., 2019; Holmes et al., 2019). This evolution has coincided with a parallel shift in pedagogical thinking, away from uniform, teacher-centered delivery and toward learner-centered, differentiated, and data-informed instruction. Adaptive learning environments, in which instructional pacing, content, and feedback respond dynamically to learner performance and behaviour, represent the practical convergence of these two trajectories. The rationale for this thematic paper is therefore twofold: first, to critically synthesize how AI technologies are redefining pedagogical practice, and second, to examine the theoretical, ethical, and policy conditions under which adaptive learning environments can be built responsibly. The discussion is situated within global educational transformations, including the rapid diffusion of generative AI following the release of publicly available large language models, and is aligned with the United Nations

Sustainable Development Goal 4 on inclusive and equitable quality education (UNESCO et al., 2023). The significance of this theme lies in its dual promise and risk: AI can extend personalized support to learners at unprecedented scale, yet it can equally entrench inequity if adopted without pedagogical and ethical grounding.

Understanding Artificial Intelligence and Adaptive Pedagogy

AIED refers to the application of machine learning, natural language processing, and data analytics to support teaching, learning, and educational administration (Zawacki-Richter et al., 2019). Within this broad field, adaptive learning environments constitute intelligent learning ecosystems in which algorithms continuously interpret learner data, such as response accuracy, response time, and engagement patterns, to adjust the sequencing, difficulty, and modality of content in real time (Al-Emran & Shaalan, 2023). Personalized learning, a closely related construct, denotes the broader pedagogical goal of tailoring goals, pace, and instructional approach to individual learners, of which AI-adaptive systems are one enabling mechanism (Essa et al., 2023).

Human-centered AI reframes these systems not as replacements for teachers but as decision-support tools that augment professional judgement (Guilherme, 2019). Smart education extends this logic to physical and virtual learning spaces instrumented with sensors, dashboards, and connected devices, while data-driven instruction describes the broader pedagogical shift toward using learning analytics to inform curricular and assessment decisions. The relationship between AI and pedagogy is therefore not unidirectional: pedagogical theory shapes how adaptive algorithms are designed and evaluated, while AI capabilities simultaneously expand what personalized, responsive teaching can look like in practice (Ivanova et al., 2024).

Theoretical Perspectives Supporting AI-Enabled Pedagogy

AI-enabled adaptive learning is best understood not as a standalone innovation but as an extension of established learning theories. Constructivism and social constructivism frame learning as an active, socially mediated process of knowledge construction; adaptive systems that sequence problems according to a learner's zone of proximal development operationalize this idea computationally (Vygotsky, 1978). Connectivism extends this further by conceptualizing learning as the formation and navigation of networks of information, positioning AI-curated content pathways as a technological expression of networked knowledge construction (Siemens, 2005).

Experiential learning theory emphasizes cycles of concrete experience, reflection, and active experimentation, which adaptive simulations and AI-powered feedback loops can support by shortening the feedback cycle (Kolb, 1984). Self-Regulated Learning (SRL) theory is particularly salient, as adaptive dashboards and AI tutors can scaffold learners' goal-setting, monitoring, and reflection processes (Zimmerman, 2002). Universal Design for Learning (UDL) offers a framework for using AI to provide multiple means of engagement, representation, and expression, thereby advancing accessibility and inclusion (CAST, 2018). The TPACK framework clarifies how educators must integrate technological, pedagogical, and content knowledge when adopting AI tools (Mishra & Koehler, 2006), while the SAMR model offers a hierarchy for evaluating whether AI use merely substitutes existing practice or

redefines it altogether (Puentedura, 2006). Finally, the Community of Inquiry framework, with its emphasis on cognitive, social, and teaching presence, provides a lens for ensuring that AI-mediated interaction does not erode the relational core of online and blended learning (Garrison et al., 2000). Collectively, these frameworks indicate that adaptive learning environments are pedagogically sound only when their design is anchored in theories of how humans actually learn, rather than in technological capability alone.

Emerging Themes in AI-Driven Pedagogical Innovation

Several interconnected themes characterize current AIED scholarship. Personalized and adaptive learning platforms adjust content sequencing based on real-time performance data, while intelligent tutoring systems simulate one-to-one instructional dialogue at scale (Holmes et al., 2019). AI-assisted lesson planning tools help teachers generate differentiated materials, and AI-supported formative assessment systems provide immediate, criterion-referenced feedback that would be difficult to deliver manually across large cohorts. Learning analytics and predictive analytics extends this capability by identifying at-risk learners and informing timely intervention (Strielkowski et al., 2024).

The emergence of generative AI has intensified these trends, enabled on-demand explanation, question generation, and multilingual support, while simultaneously raising questions about academic integrity and the authenticity of learner-produced work (Kasneci et al., 2023). AI-powered feedback systems are increasingly embedded within collaborative learning platforms, supporting peer interaction alongside individualized guidance. In parallel, AI is being positioned as an enabler of inclusive education, competency-based learning that certifies mastery rather than seat-time, and lifelong learning pathways that extend beyond formal schooling into continuous professional and civic learning (UNESCO et al., 2023).

Building Adaptive Learning Environments

Building an effective adaptive learning environment requires the integration of several interdependent components. Personalized learning pathways are generated when algorithms map learner performance against curricular objectives to recommend the next most appropriate learning activity. Dynamic curriculum adaptation extends this to the institutional level, allowing course sequences to be reorganized in response to aggregate learner data. Continuous assessment, embedded within the learning process rather than reserved for periodic examinations, allows real-time learner support, in which struggling students receive scaffolded hints before disengagement occurs.

These mechanisms have documented implications for student engagement and learning autonomy, as learners gain greater visibility into their own progress and can exercise choice over pacing and resources (Essa et al., 2023). When designed with UDL principles, adaptive systems also advance accessibility and inclusion for learners with diverse needs. Smart classrooms, equipped with sensing and analytics infrastructure, extend adaptive logic into the physical environment, while dashboards designed for teacher decision-making ensure that AI outputs inform, rather than replace professional judgement. Internationally, adaptive platforms have been piloted across contexts ranging from large-scale supplementary learning platforms in India to intelligent tutoring initiatives in East Asian and European higher education systems, illustrating both the scalability of the approach and the importance of contextualizing

it to local infrastructure and language needs (Ivanova et al., 2024).

Table 1. Traditional Instruction versus AI-Enabled Adaptive Learning

Dimension	Traditional Pedagogy	AI-Enabled Adaptive Pedagogy
Pacing	Fixed, cohort-based	Individualized, performance-based
Content sequencing	Predetermined syllabus order	Dynamically reordered by learner data
Assessment	Periodic, summative	Continuous, formative and predictive
Feedback	Delayed, teacher-mediated	Immediate, AI-assisted, teacher-verified
Role of teacher	Primary content deliverer	Facilitator and data-informed decision-maker

Source: Developed by the author, synthesizing Al-Emran and Shaalan (2023) and Holmes et al. (2019).

Opportunities and Challenges

AI-enabled pedagogy offers substantial opportunities. It can improve learning outcomes through timely, individualized feedback; empower teachers by automating routine administrative and diagnostic tasks; and extend flexible, learner-centered instruction to previously underserved populations, thereby supporting inclusive education (Strielkowski et al., 2024). It further enables data-informed decision-making at classroom and institutional levels, and fosters innovation in curriculum design and assessment.

These opportunities, however, are counterbalanced by significant challenges. Algorithmic bias can emerge when training data underrepresent certain learner populations, producing systematically less accurate recommendations for those groups. Data privacy concerns are heightened by the continuous collection of behavioural and performance data from minors, prompting UNESCO to recommend age-appropriate safeguards and clear data-governance protocols (UNESCO et al., 2023). The digital divide, encompassing gaps in connectivity, device access, and digital literacy, risk widening rather than narrowing educational inequity if adaptive systems are deployed without infrastructural investment. Teacher preparedness remains uneven, as many educators report limited training in interpreting and acting on AI-generated insights (Zawacki-Richter et al., 2019). Additional concerns include threats to academic integrity posed by generative AI, the risk of learner overdependence on automated systems, and the absence, in many jurisdictions, of coherent governance and regulatory frameworks for educational AI.

Table 2. Opportunities and Challenges of AI in Education

Opportunities	Challenges
Improved, individualized learning outcomes	Algorithmic bias and unfair recommendations
Teacher empowerment and workload reduction	Data privacy and protection of minors
Inclusive, flexible access to learning	Digital divide in infrastructure and access
Innovation in assessment and curriculum	Uneven teacher preparedness and AI literacy

design	
Timely, data-informed decision-making	Governance gaps and regulatory uncertainty

Source: Developed by the author, drawing on UNESCO et al. (2023) and Zawacki-Richter et al. (2019).

The Future of Pedagogy

Emerging discourse increasingly frames the trajectory of AI-enabled schooling as a movement toward 'Education 5.0' or 'Pedagogy 5.0', a paradigm oriented around human-AI collaboration rather than automation for its own sake. In this vision, AI literacy becomes a foundational competency for both students and educators, comparable in importance to traditional literacy and numeracy, and is explicitly promoted through frameworks such as UNESCO's AI competency framework for students (Miao & Shiohira, 2024). Intelligent classrooms are anticipated to combine adaptive content delivery with human facilitation that preserves relational and social dimensions of learning, consistent with the Community of Inquiry framework (Garrison et al., 2000). Future-ready teachers will need fluency not only in subject content but in evaluating, customizing, and ethically deploying AI tools, positioning digital citizenship, and critical evaluation of AI outputs as core professional competencies. Sustainable AI integration will depend on institutions embedding governance, transparency, and periodic algorithmic auditing into procurement and deployment practices. At a systemic level, AI is expected to support lifelong learning by enabling flexible, stackable, and continuously updated learning pathways that extend well beyond the boundaries of formal schooling, contributing to broader global educational transformation aligned with SDG 4.

Implications for Educational Stakeholders

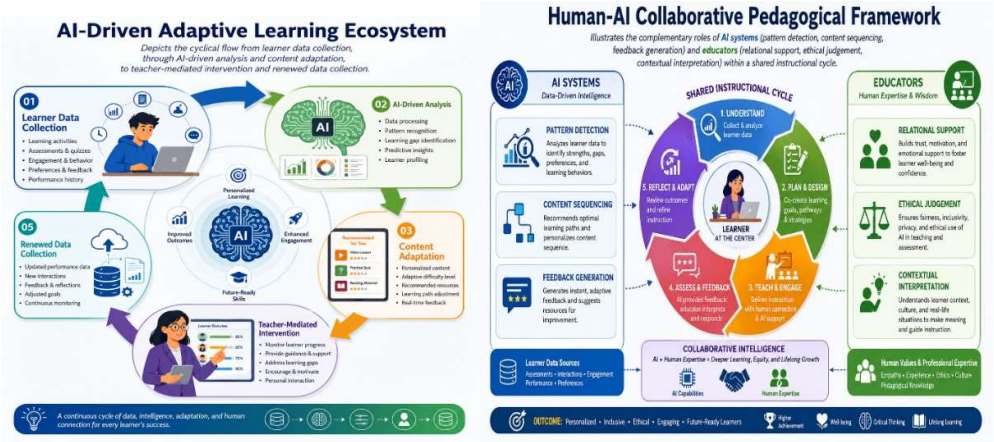
For teachers, the central implication is a shift in professional identity from primary information source to facilitator, curator, and interpreter of AI-generated insight; ongoing professional development in AI and data literacy is therefore essential. Teacher educators must correspondingly revise pre-service curricula to embed TPACK-aligned training in adaptive technologies. School leaders are called upon to build institutional capacity for responsible AI adoption, including infrastructure, data governance policy, and staff training pathways.

Curriculum developers should design content and assessment structures that are modular and machine-readable without sacrificing depth or critical thinking. Educational institutions must invest in equitable access to hardware, connectivity, and multilingual AI tools, particularly in under-resourced settings. Policymakers, informed by frameworks such as NEP 2020 and international guidance from UNESCO, should establish clear regulatory guardrails covering data privacy, algorithmic accountability, and age-appropriate use (UNESCO et al., 2023; Jolly & Kaur, 2025). Researchers are encouraged to strengthen the currently weak connection between AIED development and pedagogical theory identified in prior systematic reviews (Zawacki-Richter et al., 2019), while students themselves require structured opportunities to develop AI literacy and self-regulation skills so that adaptive systems support, rather than substitute for, their own agency as learners.

Table 3. Future Competencies for AI-Ready Educators

Competency	Description
AI and data literacy	Ability to interpret learning-analytics dashboards and AI-generated recommendations critically
Ethical judgement	Capacity to identify bias, privacy risk, and inappropriate AI use in classroom contexts
Pedagogical integration (TPACK)	Skill in blending technological, pedagogical, and content knowledge when selecting AI tools
Human-AI collaboration	Ability to delegate routine tasks to AI while retaining relational and mentoring roles
Continuous adaptability	Willingness to update practice as AI tools and institutional policy evolve

Source: Developed by the author, informed by Mishra and Koehler (2006) and Miao and Shiohira (2024).



Conclusion:

This paper has argued that AI is redefining pedagogy by enabling adaptive learning environments capable of personalizing pace, content, and feedback at scale. This transformation is most productive when grounded in established learning theories, from constructivism and connectivism to Universal Design for Learning and TPACK, rather than treated as a purely technical undertaking. The analysis has shown that opportunities for improved outcomes, inclusion, and teacher empowerment are real, but so are the risks of algorithmic bias, privacy erosion, digital inequity, and eroded teacher preparedness. The future of pedagogy, as this paper has framed it, lies in deliberate human-AI collaboration rather than automation for its own sake, supported by coherent institutional and national policy frameworks such as those articulated by UNESCO and, in the Indian context, by NEP 2020 and NCF 2023. Responsible, ethically governed integration of AI, anchored in pedagogical theory and educator agency, offers the most credible pathway toward building adaptive learning environments that are both intelligent and humane.

IMPACT OF ICT AND PEDAGOGICAL COMPETENCY ON TEACHER EFFECTIVENESS OF SECONDARY SCHOOL TEACHERS IN BELAGAVI CITY

Mahantesh Hiremath
Research Scholar, Department of Education Kitturu Rani Channamma University, Belagavi
Manjunath B. Kori
Associate Professor, B.L.D.E.A J.S.S College of Education Vijayapura.

Abstract

Information and Communication Technology (ICT) has become an integral component of contemporary education. The integration of ICT requires teachers to possess not only digital skills but also appropriate pedagogical competencies. The present study examines the relationship between ICT competency, pedagogical competency and teacher effectiveness among secondary school teachers in Belagavi City. The proposed study follows a quantitative research approach and a descriptive-correlational design. A sample of 57 secondary school teachers is considered. ICT competency, pedagogical competency and teacher effectiveness constitute the major variables. Data are proposed to be collected through structured rating scales covering ICT use, digital teaching practices, lesson planning, instructional strategies, classroom management, assessment and professional effectiveness. Descriptive statistics, Pearson's product-moment correlation and multiple regression are proposed for analysis. The illustrative results indicate positive relationships among ICT competency, pedagogical competency and teacher effectiveness. The study emphasizes that professional development should integrate technology with pedagogy rather than treating ICT as an isolated technical skill. Because actual responses were not available at the time of preparation, the numerical statistical results included in this manuscript are explicitly illustrative and must be replaced with actual calculations before empirical publication.

Keywords: ICT Competency, Pedagogical Competency, Teacher Effectiveness, Secondary School Teachers, Digital Pedagogy, Technology Integration, Belagavi City.

Introduction:

Information and Communication Technology had become an important component of contemporary education. The rapid expansion of computers, smartphones, digital learning platforms, multimedia resources, online assessment systems and artificial intelligence-based educational applications had changed the ways in which teachers prepare lessons, present information, communicate with learners and assess learning.

The role of the teacher had consequently expanded beyond the traditional function of transmitting information. Teachers were increasingly expected to act as facilitators, learning designers, mentors, digital-resource users and assessors. UNESCO's ICT Competency Framework for Teachers identifies digital competencies that support teaching and learning, assessment, school organization and continuing professional development (UNESCO, 2018).

In India, the importance of technology in education had also been recognized at the policy level. The National Education Policy 2020 emphadizes the use and integration of technology for improving teaching-learning and evaluation processes, supporting teacher preparation and professional development (Ministry of Education, 2020).

However, effective ICT integration cannot be achieved merely by providing digital infrastructure. Teachers needed to possess the knowledge and ability to select appropriate technology according to the subject matter, learning objectives and needs of students. Mishra and Koehler (2006) developed the Technological Pedagogical Content Knowledge framework to explain the interaction among technology, pedagogy and content knowledge requiredd for effective technology integration.

Thus, ICT competency and pedagogical competency were closely related to contemporary teacher effectiveness. The present study focused on these competencies among secondary school teachers in Belagavi City.

Background of the Study

The increasing availability of digital technology had created opportunities for teachers to provide flexible and engaging learning experiences. Digital presentations, educational videos, simulations, virtual laboratories, online quizzes, electronic textbooks and learning-management platforms can supplement traditional classroom teaching.

Nevertheless, the educational value of technology depends largely on how teachers use it. UNESCO (2018) emphadizes that digital competencies should be connected with teaching and learning, assessment and professional learning. Similarly, NEP 2020 recognizes technology as an important support for teaching-learning, evaluation and teacher professional development (Ministry of Education, 2020).

Rathnabai (2024) emphadized systematic capacity building for technology-pedagogy integration among in-service teachers. Lyngdoh (2025) also highlighted ICT-related challenges and the need for stronger training and pedagogical alignment. These developments demonstrated the need to examine teachers' ICT competency alongside their pedagogical competency.

ICT Competency and Teacher Effectiveness

ICT competency referred to a teacher's ability to use digital technologies appropriately for educational purposes. It encompasses basic digital literacy, information searching, digital communication, digital-content creation, online teaching, digital assessment and professional development.

ICT competency supported teacher effectiveness by enabling teachers to access current educational resources, present difficult concepts through multimedia, provide interactive learning activities, conduct formative digital assessment, provide rapid feedback and communicate through digital platforms. UNESCO (2018) places ICT within broader teaching, assessment and professional practice rather than treating it as a purely technical skill.

Pedagogical Competency and Teacher Effectiveness

Pedagogical competency is a fundamental component of effective teaching. It includedd lesson planning, instructional strategies, classroom management, assessment, questioning, motivation and learner-centred practices. An effective teacher needs to understand not only what to teach but also how to teach it.

The TPACK framework emphadizes that effective technology integration requiredd interaction among technological knowledge, pedagogical knowledge and content knowledge (Mishra & Koehler, 2006). Koehler, Mishra, and Cain (2013) further explained that

technology integration requiredd teachers to understand how technological knowledge interacts with pedagogy and content.

Technology-Pedagogy Integration

Technology was expected to not simply be added to an existing lesson. Teachers needed to determine whether a particular technology improves learning and how it should be integrated. A science teacher may use a simulation to demonstrate an otherwise difficult experiment, while a social science teacher may use digital maps and historical archives. In each case, technology becomes meaningful only when connected with appropriate pedagogy.

The TPACK framework provided a theoretical foundation for this integration and emphadizes the interaction among technology, pedagogy and content knowledge (Mishra & Koehler, 2006).

Need and Significance of the Study

The study was significant because of the increasing digitalization of education, changing teacher roles, the importance of pedagogical competency, professional development needs, the local educational context of Belagavi City and the policy emphadis on technology integration under NEP 2020. The findings could help school administrators and teacher educators identify areas for professional development.

Statement of the Problem

"Impact of ICT and Pedagogical Competency on Teacher Effectiveness of Secondary School Teachers in Belagavi City."

Objectives of the Study

1. To assess the level of ICT competency among secondary school teachers in Belagavi City.
2. To assess the level of pedagogical competency and teacher effectiveness among secondary school teachers in Belagavi City.
3. To examine the relationship between ICT competency, pedagogical competency and teacher effectiveness among secondary school teachers.
4. To determine the combined contribution of ICT competency and pedagogical competency to teacher effectiveness among secondary school teachers.

Hypotheses of the Study

H_o1: There is no significant relationship between ICT competency and teacher effectiveness among secondary school teachers.

H_o2: There is no significant relationship between pedagogical competency and teacher effectiveness among secondary school teachers.

H_o3: There is no significant relationship between ICT competency and pedagogical competency among secondary school teachers.

H_o4: ICT competency and pedagogical competency did not significantly predict teacher effectiveness among secondary school teachers.

Conceptual Framework

ICT Competency → Teacher Effectiveness ← Pedagogical Competency

The framework assumed that ICT competency and pedagogical competency may independently and jointly contribute to teacher effectiveness. The theoretical foundation is consistent with the TPACK framework (Mishra & Koehler, 2006).

Operational Definitions

- ICT Competency: The knowledge, skills and ability of secondary school teachers to use digital technologies for teaching, learning, assessment, communication and professional development.
- Pedagogical Competency: The ability of teachers to plan, organize and implement effective teaching-learning activities, use appropriate instructional strategies, manage classrooms and assess learners.
- Teacher Effectiveness: The extent to which teachers successfully perform instructional and professional responsibilities, including planning, teaching, classroom management, student engagement and assessment.
- Secondary School Teachers: Teachers working in recognized secondary schools within Belagavi City.

Review of Related Literature

UNESCO's ICT Competency Framework for Teachers provided a comprehensive framework for teacher digital competence, including pedagogy, curriculum, assessment, school organization and professional development (UNESCO, 2018).

Mishra and Koehler (2006) introduced TPACK to explain the knowledge requiredd for effective technology integration. Koehler et al. (2013) further explained its significance for technology-supported teaching.

Rathnabai (2024) emphadized systematic capacity building that integrates content, pedagogy and ICT among in-service teachers. Lyngdoh (2025) examined ICT competency, awareness and challenges among school teachers and highlighted the need for ICT-related training and pedagogical alignment.

The National Education Policy 2020 provided an important policy context by emphadizing technology in teaching-learning, evaluation and teacher professional development (Ministry of Education, 2020).

Research Gap

Existing literature demonstrated considerable interest in ICT competency and technology integration. However, there is a need to examine ICT competency and pedagogical competency simultaneously as factors associated with teacher effectiveness. Many studies focus on technical ICT skills, whereas contemporary frameworks emphadize the integration of technology with pedagogy and content. There is also value in localized research among secondary school teachers in Belagavi City. The present study addressed this gap through the proposed model ICT Competency + Pedagogical Competency → Teacher Effectiveness.

Methodology

Research Approach: Quantitative research approach.

Research Design: Descriptive-correlational research design.

Population: Secondary school teachers working in recognized secondary schools in Belagavi City.

Sample: 57 secondary school teachers (N = 57). The sample was intended to represent teachers from different categories of secondary schools in Belagavi City.

Geographical and Demographic Profile

The study was geographically restricted to Belagavi City, Karnataka. The following table presents an illustrative distribution of the 57 proposed respondents.

Tools for Data Collection

Three scales were proposed: (1) ICT Competency Scale covering digital literacy, internet use, digital content creation, multimedia teaching, digital communication, online platforms, digital assessment and digital safety; (2) Pedagogical Competency Scale covering lesson planning, instructional strategies, classroom management, learner-centred teaching, questioning, motivation, assessment and feedback; and (3) Teacher Effectiveness Scale covering instructional effectiveness, student engagement, classroom management, communication, assessment, feedback, professional responsibility and adaptability. A five-point Likert scale was used.

Data Collection Procedure

Permission was obtained from concerned school authorities. The purpose of the study was explained to teachers and participation should be voluntary. Questionnaires was administered personally or electronically. Responses were coded and entered into statistical software, and incomplete responses screened before analysis.

Statistical Techniques

Frequency and percentage; mean and standard deviation; Pearson's product-moment correlation; and multiple regression analysis were recommended.

Data Analysis and Interpretation:

The statistical analysis was presented using the responses of 57 secondary school teachers. The results were interpreted using descriptive statistics, Pearson's correlation and multiple regression.

Table 1. Geographical and Demographic Profile of the Proposed Sample (N = 57)

Variable	Category	Frequency	Percentage
Gender	Male	30	52.63
	Female	27	47.37
School Management	Government	19	33.33
	Aided	16	28.07
	Private Unaided	22	38.60
Teaching Experience	Below 5 years	15	26.32
	5–10 years	20	35.09
	Above 10 years	22	38.60
Qualification	Graduate	12	21.05
	Postgraduate	38	66.67
	M.Ed./Other	7	12.28
ICT Training	Received	41	71.93
	Not received	16	28.07

The demographic profile of the proposed sample indicates that, out of the 57 respondents, 30 (52.63%) were male and 27 (47.37%) were female, showing a relatively balanced gender distribution. With regard to school management, 22 respondents (38.60%)

were from private unaided schools, followed by 19 (33.33%) from government schools and 16 (28.07%) from aided schools. In terms of teaching experience, the largest proportion, 22 respondents (38.60%), had more than 10 years of experience, while 20 (35.09%) had 5–10 years and 15 (26.32%) had less than 5 years of experience. Regarding educational qualification, 38 respondents (66.67%) were postgraduates, 12 (21.05%) were graduates, and 7 (12.28%) possessed M.Ed. or other qualifications. Further, 41 respondents (71.93%) had received ICT training, whereas 16 (28.07%) had not received such training. Overall, the sample represents teachers with varied professional backgrounds, qualifications, school-management affiliations, and levels of ICT training.

Table 2. Descriptive Statistics of Major Variables

Variable	N	Mean	SD	Level
ICT Competency	57	78.42	8.16	High
Pedagogical Competency	57	82.67	7.24	High
Teacher Effectiveness	57	84.31	6.87	High

Table 2 presents the descriptive statistics of the major variables among the 57 respondents. The mean score for **ICT Competency** was **78.42** with a standard deviation of **8.16**, indicating a high level of ICT competency among the respondents. **Pedagogical Competency** recorded a mean of **82.67** and a standard deviation of **7.24**, which also indicates a high level of pedagogical competency. **Teacher Effectiveness** had the highest mean score of **84.31** with a standard deviation of **6.87**, suggesting a high level of teacher effectiveness among the respondents. Overall, the findings indicate that the proposed sample demonstrates **high levels of ICT competency, pedagogical competency, and teacher effectiveness**.

Table 3. Pearson Correlation among ICT Competency, Pedagogical Competency and Teacher Effectiveness

Variables	ICT Competency	Pedagogical Competency	Teacher Effectiveness
ICT Competency	1.00	.58**	.64**
Pedagogical Competency	.58**	1.00	.72**
Teacher Effectiveness	.64**	.72**	1.00

Note. **p < .01; N = 57.

Table 3 presents the Pearson correlation coefficients among ICT competency, pedagogical competency, and teacher effectiveness. The results indicate a moderate positive and statistically significant relationship between ICT competency and pedagogical competency ($r = .58$, $p < .01$). ICT competency also showed a moderately strong positive and statistically significant relationship with teacher effectiveness ($r = .64$, $p < .01$). Further, pedagogical competency demonstrated a strong positive and statistically significant relationship with teacher effectiveness ($r = .72$, $p < .01$). These findings suggest that teachers with higher ICT competency tend to have higher pedagogical competency and greater teacher effectiveness. Similarly, higher pedagogical competency is associated with higher teacher effectiveness. However, as these are correlation coefficients, the findings indicate association rather than causation.

Table 4. Multiple Regression Analysis Predicting Teacher Effectiveness

Predictor	B	SE	β	t	P
Constant	28.16	7.41	—	3.80	<.001
ICT Competency	0.31	0.09	.37	3.44	.001
Pedagogical Competency	0.46	0.10	.51	4.67	<.001

Table 4 presents the results of the multiple regression analysis conducted to determine the contribution of ICT competency and pedagogical competency in predicting teacher effectiveness. The results show that ICT competency is a significant positive predictor of teacher effectiveness ($B = 0.31$, $\beta = .37$, $t = 3.44$, $p = .001$). This indicates that an increase in ICT competency is associated with an increase in teacher effectiveness, when pedagogical competency is statistically controlled. Similarly, pedagogical competency is a significant positive predictor of teacher effectiveness ($B = 0.46$, $\beta = .51$, $t = 4.67$, $p < .001$). Among the two predictors, pedagogical competency has the larger standardised regression coefficient ($\beta = .51$), suggesting that it makes a stronger unique contribution to teacher effectiveness than ICT competency in this model. Overall, both ICT competency and pedagogical competency significantly and positively predict teacher effectiveness.

Major Findings

- The illustrative dataset indicated relatively high ICT competency.
- Pedagogical competency is also relatively high.
- Teacher effectiveness demonstrated a comparatively high mean score.
- ICT competency is positively associated with teacher effectiveness.
- Pedagogical competency showed a stronger positive association with teacher effectiveness.
- ICT competency and pedagogical competency are positively related.
- The illustrative regression model indicated that both competencies jointly contribute to teacher effectiveness.

Discussion

The illustrative findings are consistent with the theoretical position that technology integration is most effective when combined with sound pedagogy. Teachers with appropriate ICT skills was better able to access resources, prepare multimedia lessons, communicate with learners and conduct technology-supported assessment. UNESCO (2018) similarly places ICT within broader teaching, assessment and professional practice.

The relationship between pedagogical competency and teacher effectiveness is theoretically expected because effective teaching requiredd planning, instructional strategy, classroom management and assessment. The TPACK framework explained why technological knowledge needs to interact with pedagogical and content knowledge (Mishra & Koehler, 2006).

The findings are also relevant to NEP 2020, which emphadizes technology in teaching-learning, evaluation and teacher professional development (Ministry of Education, 2020). Rathnabai (2024) similarly emphadizes systematic capacity building that integrates content, pedagogy and ICT.

Educational Implications

Teachers were expected to continuously develop ICT skills and learn to integrate digital tools into subject-specific pedagogy. School administrators were recommended to provide infrastructure, technical support and professional learning opportunities. Teacher education programmes should incorporate technology-integrated lesson planning and digital assessment. Educational authorities were recommended to design professional-development programmes around technology-pedagogy integration rather than basic computer literacy alone.

Recommendations

1. Organize regular ICT-integrated pedagogy workshops.
2. Provide practical training in digital content creation and assessment.
3. Link ICT training with subject-specific teaching methods.
4. Provide reliable digital infrastructure and technical assistance.
5. Encourage teachers to develop digital teaching materials.
6. Establish professional learning communities for sharing ICT-integrated practices.
7. Include emerging technologies and responsible digital practices in professional development.
8. Conduct larger studies across Belagavi district.

Limitations

The statistical analysis was presented using the responses of 57 secondary school teachers. The results were interpreted using descriptive statistics, Pearson's correlation and multiple regression.

Suggestions for Further Research

Future studies could use larger samples, compare government, aided and private schools, compare urban and rural teachers, examine subject-wise differences, investigate school leadership and ICT support, study digital competency and student achievement, investigate artificial intelligence use in education, and conduct longitudinal research following ICT professional development.

Conclusion

ICT had become an important component of contemporary education, but effective educational technology use depends on teachers' ability to integrate technology with appropriate pedagogy. The present study focused on ICT competency and pedagogical competency as factors associated with teacher effectiveness among secondary school teachers in Belagavi City.

The proposed framework is supported by TPACK, which emphadizes the interaction among technological, pedagogical and content knowledge (Mishra & Koehler, 2006). UNESCO's ICT Competency Framework similarly demonstrated that teacher digital competence encompasses teaching, assessment and professional development (UNESCO, 2018). NEP 2020 also emphadizes technology integration in teaching-learning, assessment and teacher professional development (Ministry of Education, 2020).

The illustrative analysis suggests positive relationships among ICT competency, pedagogical competency and teacher effectiveness, with pedagogical competency showing a

comparatively stronger association. These numerical results must be replaced with genuine results after data collection. Effective digital education ultimately requiredd more than hardware and software; it requiredd teachers with the knowledge, confidence and pedagogical capacity to use technology purposefully.

ANALYTICAL PERSPECTIVE ON TEACHER STRATEGIES FOR STUDENT ENGAGEMENT AMID CLASS ROOM CONFLICT

Preeti Kushwaha
Research Scholar, Department of Teacher Education, Dayanand Girls P.G College Civil Lines Kanpur

Abstract

Classroom conflict as the mirror of teacher education and inadequate preparation for the discipline. When student engage in disruptive behaviour teacher are forced to divert attention from instruction to discipline, which diminishes effective teaching time. Teacher education program to improved students life skill, higher teacher retention and greater classroom innovation .Teacher education program play a crucial role in the Managing classroom conflict and behaviour management, they are strike synthesis the importance of the teacher education outline persistent and emerging challenges, effective teacher education programs equips with strong subject knowledge , classroom conflict Strategies and reflective practice. Trend and experience teachers improve students learning outcomes and reduce classroom conflicts and fosters 21st century skills. The study investigates the challenges of class room conflicts and how teacher education program pay significant challenges in adequate preparation and miss alignment between training and classroom conflict realities. The study deal with the different kinds of behaviour challenges and interpersonal relationship between teachers and students face are in classroom Society. The study emphasizes the importance of classroom conflict is not only a school issue but also a reflection of teacher education qualities, Reflective teachers who provide quality education to every learners more align with cognitive thinking, lack of practical exposure during teachers training program . Intern's teacher mainly focused on subject knowledge, content delivery and active learning but its meaning has changed over time.

Keywords*: student engagement, disruptive behaviour, teacher education, teaching strategies in class.*

INTRODUCTION

Teacher education is one of the most important foundation of a strong and effective education system, the teacher must create a safe stimulating and inclusive learning environment that enables every child to learn .Reflective teachers provide quality education to every learner more aligned with cognitive thinking teacher education has always been Centre to education but it's meaning change to overtime. High quality teachers training ensure that classroom cultivate critical thinking rather than more Rote memorization. Behaviour is the mirror of in which everyone shows there image of the society and its reflecting we will stand in future. Student's behaviour plays an important role in a creating a positive learning environment However teacher and student face of biggest challenge interpersonal communication gap and lack of participation. Students fill the communication gap through the digital platform and any other activities .The 1966 "policy was first to say teacher must be trained not just subject". Experiencing student engagement has highlighted the need to understand it causes consequence and implication for effective teaching and strategies.

Objective of the study:

To explore strategies used by the teacher and promoting responsibilities and cooperation.

How to manage students' behaviours and classroom conflict.

Why behavioural changes do face every teacher in his classroom.

How does teacher student communication gap affects positive learning environment

Need for the study: this study aims to evaluate the classroom conflicts to face teachers in his class room. A curriculum maybe excellent and Technology may be advance but without competent and committed teachers educational goal cannot be fully achieved. Teacher education program prepare educators to teach modern technology and design thinking. **Why the shift matter how it is happened and what means for the future.**

Reason behind of class room conflict and students disengagement:

Miss interpretation and weak relationship of lead to more classroom conflict when students do not participate positively teacher may feel their efforts are in effective.

Teacher have little behaviour management training and used only trial and error method.

No study classroom monitoring, some students suffer to regulate frustration and Burnout which is direct effect student Social Skill and wellbeing.

Teacher have better classroom management skills but experience fever to manage disruptive behaviour problem. We do not have a better strategies reduce classroom description and conflicts there is not a one size fits all

Lack of classroom management experience among trainee teachers

Insufficient practical experience in classroom conflict

Difficulty in developing effective classroom practice skills, miss interpretation and poor communications skill.

The findings of the study: the study revealed a significant relationship between trained experience teachers among untrained and an experience teachers. . Teacher education program should be include behaviour management training and evidence base communication strategies. Trained teacher know the student psychology of learning and how to make knowledge accessible to every unique mind .Competent teachers can explain concept clearly, select suitable teaching Strategies and address learning difficulties effectively. **Trained and experienced teachers is like a candle it consume itself to light the way for others.** Teachers have a better classroom management skills align with the student's cognitive style, to managing disruptive behaviour and class room conflict.

Conclusion: Teacher and students relationship in the foundation of civilization it is not about the feeling a mind, teacher education program can be integrated training in classroom conflict management to equip future with effective Strategies for fostering creativity. Professional training encourage teachers to understand students listen to them respect their individuality, teachers are mirror of the society reflecting we will stand in future. Integrating Training Institute as the Bedrock of national programs progress and manage to effective strategies for fostering creativity and with different abilities.

IMPACT OF GENERATIVE AI TOOLS ON TEACHING EFFECTIVENESS AND LEARNING ENGAGEMENT

Smt. Shobha H V
Research Scholar, Vijayanagar Sri Krishnadevaraya University
Jnana Sagara Campus, Ballari
Dr. Gopal.N
Research Guide , Assistant Professor, Vijayanagar Sri Krishnadevaraya University
Jnana Sagara Campus, Ballari, Department of Studies in Education

Abstract

Generative Artificial Intelligence has emerged as an important technological development in the field of education. Tools such as ChatGPT, Gemini, Microsoft Copilot and other AI-based applications can generate text, explanations, questions, lesson plans, examples, summaries and learning activities. Their increasing use has created new possibilities for improving teaching effectiveness and student learning engagement. purpose of this study is to systematically assess the role of Generative AI in classroom teaching, with a specific focus on how teacher supervision shapes its effectiveness. Recent research indicates that GenAI can positively influence learning outcomes, motivation, and cognitive, behavioural and emotional engagement, although its effectiveness depends on how, where and under what conditions it is used. This article discusses the uses, benefits, challenges and educational implications of generative AI tools, with particular attention to teaching effectiveness and learning engagement. It argues that GenAI should complement rather than replace teachers and should be integrated through appropriate pedagogical, ethical and human-centred practices.

Keywords: *Generative AI, ChatGPT, teaching effectiveness, learning engagement, personalized learning, artificial intelligence, education.*

Introduction:

Technology has become an important component of contemporary education. Among recent technological developments, Generative Artificial Intelligence has attracted considerable attention because it can produce new content in response to natural-language instructions. Technology has always played a big role in education. Every new tool has changed how students learn. Artificial intelligence (AI) is shaping the future of education among the many advancements and making a big impact on teaching method.

Generative AI tools can support teachers in lesson planning, preparation of instructional materials, question generation, assessment, feedback and differentiated instruction. For students, they can provide explanations, examples, personalized assistance and opportunities for interactive learning. A 2025 systematic review of pedagogical applications in higher education found that Generative AI is being used across different instructional contexts and disciplines, with generators, re-imaginers and assistants among the commonly applied types.

Therefore, it is important to examine not merely whether AI is used in education, but whether its use actually improves teaching effectiveness and encourages students to participate actively

in learning.

Significance of Generative AI Tools on Teaching:

Generative AI refers to artificial intelligence systems capable of producing new content such as text, images, audio, video, computer code and other forms of media based on user instructions. In education, these systems can function as teaching assistants, learning companions, content-generation tools and feedback-support systems.

Generative AI tools in teaching changing education and improving personalised learning and making teaching more efficient and opening up new ways to create interactive lessons. However, teacher must use wisely to balance it benefits with ethical concerns with the right approach can make more engaging, accessible and effective for learners everywhere. AI based diagnostic tools can examine students to identify certain misconceptions in subjects and also great at finding patterns in students work and finding common lexical mistakes.

Examples include ChatGPT, Google Gemini, Microsoft Copilot and AI-supported educational applications. Their educational value depends largely on the quality of the prompts, the teacher's pedagogical decisions and the learner's ability to evaluate and use the generated information critically.

Use of Generative AI in Teaching:

Generative AI in teaching and learning making it more adaptive and effective. Different AI tools can adjust problem difficulty and type based on individual student performance, providing a tailored learning experience. A learning tool that uses AI to customize lessons to each learner’s pace and skill level.

Generative AI Generative AI can be used in several areas of teaching:

- **Lesson Planning**

Teachers can use AI to develop lesson plans, learning objectives, classroom activities and teaching strategies according to the subject and level of learners.

- **Preparation of Teaching Materials**

AI can help generate summaries, examples, worksheets, discussion questions, quizzes, case studies and presentation content. This can reduce routine preparation time and allow teachers to devote more attention to classroom interaction.

- **Personalized Instruction**

AI can provide explanations at different levels of complexity and can support differentiated learning. Students who require additional assistance can receive explanations or examples suited to their learning needs.

- **Assessment and Feedback**

Teachers can use AI to generate assessment questions, rubrics and formative feedback. AI-assisted feedback can provide students with immediate suggestions for improving their work, although teacher verification remains important.

- **Interactive Learning**

AI-based conversational systems can allow students to ask questions and receive immediate responses. This can promote active participation and provide opportunities for individual or small-group learning.

Impact on Teaching Effectiveness:

Teaching effectiveness refers to the teacher's ability to facilitate meaningful learning through appropriate planning, instructional strategies, classroom interaction, assessment and feedback.

Generative AI can contribute to teaching effectiveness in the following ways:

- Improved lesson preparation: Teachers can generate initial lesson materials more quickly.
- Variety in instructional strategies: AI can suggest different teaching methods and classroom activities.
- Differentiated teaching: Content can be adapted to different learner levels.
- Immediate resource generation: Teachers can create examples, questions and activities according to specific learning objectives.
- Assessment support: AI can assist in developing formative assessments and feedback.
- Teacher productivity: By reducing some routine tasks, AI may allow teachers to focus more on mentoring, discussion and higher-order learning. A 2025 systematic review of GenAI applications in teaching identified a growing range of classroom uses and emphasized that its educational effectiveness depends on instructional context and strategy rather than simply on the presence of the technology.

Impact on Learning Engagement:

Learning engagement is a multidimensional concept generally involving students' behavioural, cognitive and emotional participation in learning.

Generative AI can influence these dimensions in several ways:

- Behavioural Engagement
- Interactive AI activities can encourage students to participate, practise, ask questions and complete learning tasks.
- Cognitive Engagement
- AI can support students in exploring concepts, comparing ideas, generating explanations and solving problems. A 2025 systematic review and meta-analysis found a medium positive effect of ChatGPT-based learning on overall student engagement, with a particularly strong effect reported for cognitive engagement.
- Emotional Engagement
- Personalized assistance and immediate responses may make learning more accessible and interesting, potentially increasing students' interest and confidence.

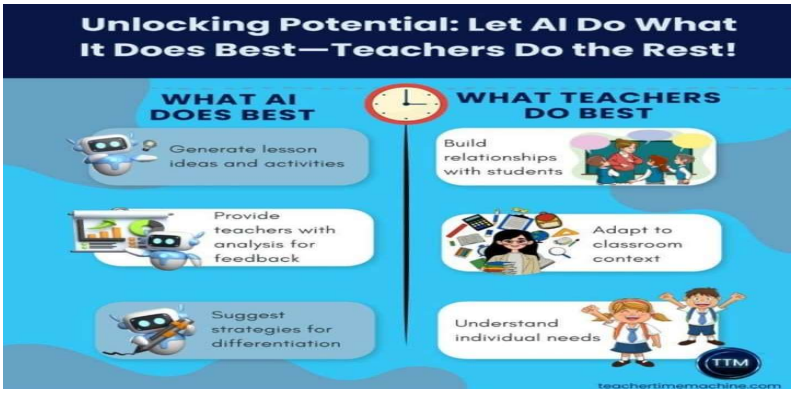
- Recent meta-analytic evidence also reports positive effects of GenAI on university students' motivation and multiple dimensions of engagement, particularly cognitive and emotional engagement in individual and small-group learning contexts.

Benefits of Generative AI in Education:

The major benefits include:

- Personalized learning experiences.
- Increased student participation.
- Immediate feedback and assistance.
- Support for teachers in lesson preparation.
- Creation of diverse learning resources.
- Development of interactive learning activities.
- Support for self-directed learning.
- Assistance with language learning and writing.
- Opportunities for collaborative and problem-based learning.
- Support for differentiated and inclusive instruction.

A recent meta-analysis of experimental studies found an overall positive effect of GenAI on learning outcomes, while also showing that the size of the effect varies according to educational level, subject, intervention duration and other contextual factors.



Challenges and Limitations:

Despite its potential, GenAI also presents important challenges.

❖ **Accuracy of Information**

AI systems can generate incorrect or misleading information. Therefore, teachers and students should verify important information using reliable sources.

❖ **Overdependence on AI**

Excessive dependence on AI may reduce students' independent thinking, problem-solving and learning effort. Research on ChatGPT engagement has also identified over-reliance as a potential risk.

❖ **Academic Integrity**

Students may use AI to complete assignments without developing the required knowledge and skills. Teachers therefore need assessment strategies that emphasize reasoning, application and authentic performance.

❖ **Academic Integrity**

Students may use AI to complete assignments without developing the required knowledge and skills. Teachers therefore need assessment strategies that emphasize reasoning, application and authentic performance.

❖ **Privacy and Data Protection**

The use of AI tools may involve student information and educational data. UNESCO recommends a human-centred approach that includes attention to data privacy, ethical validation and appropriate regulation.

❖ **Digital Inequality**

Not all students have equal access to devices, reliable internet connections or AI tools. Unequal access can increase existing educational inequalities.

❖ **Teacher Preparedness**

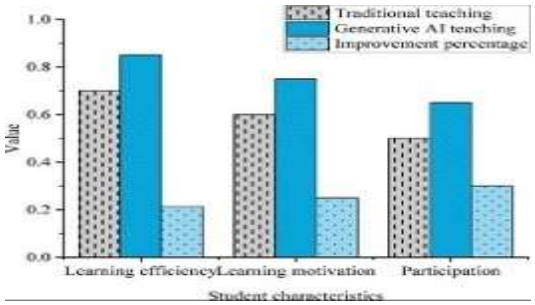
Teachers need AI literacy and professional development to use GenAI effectively. UNESCO emphasizes the need for teacher training and human-centred integration of GenAI into education.

Role of the Teacher in the Age of Generative AI:

Generative AI should not replace the teacher. The teacher continues to play a central role in motivating students, developing critical thinking, managing classroom interaction, understanding individual learners and providing emotional and social support. The teacher should act as a facilitator, evaluator, mentor and ethical guide while using AI as a supporting technology. UNESCO's guidance similarly emphasize that AI should support human agency and should not displace the unique role of teachers in higher-order thinking and human interaction.

Suggestions for Effective Use:

For effective implementation of GenAI in education: Provide AI-literacy training for teachers and students. Use AI in alignment with clearly defined learning objectives. Verify AI-generated information before using it. Encourage students to critically evaluate AI responses. Combine AI activities with teacher-led discussion and collaboration. Develop clear institutional policies for responsible AI use. Protect student privacy and personal data. Design assessments that measure genuine understanding and application. Ensure equitable access to AI-supported learning. Use AI to enhance, not replace, meaningful human interaction.



Conclusion:

Generative AI represents an important opportunity for transforming teaching and learning. It can support teachers in lesson planning, content development, assessment and personalized

instruction while providing students with interactive and flexible learning opportunities. Current research generally indicates positive effects on learning outcomes and engagement, although the effects vary according to context and method of implementation. The impact of GenAI ultimately depends on how teachers and learners use it. Responsible integration requires teacher competence, critical evaluation, ethical awareness, data protection and appropriate pedagogical design. Therefore, generative AI should be viewed not as a replacement for teachers but as a powerful educational support tool. When used thoughtfully and responsibly, it can contribute to improved teaching effectiveness, greater learning engagement and more personalized educational experiences.

Department of Education
Vedant Deep Jigana
Research Scholar, Chhatrapati Shahu Ji Maharaj University Kanpur
Department of Education

Abstract

Artificial Intelligence is playing a vital role in improving the quality of education. It is not only providing different teaching methods to students but also helping in making the teaching learning process effective. The Ancient Indian Education system was based on the holistic development of the learner to make teaching effective. only learner centered teaching method are being developed but the teacher is also being made effective. the use of Artificial Intelligence has been made. AI is used for personalized learning through which creative activities are made available to students according to their needs. AI based program students with explanation and help in skill practice. It also helps in adaptive assessment, through which the difficulty level of question can be increased or decreased according to the learner's level, Feedback can be provide through it and student – teachers can provide feedback and assessment according to the performance of the students. Inclusive education can also be promoted through AI. Its translation, text to speech and assistive technologies can help in identifying and understanding the learning needs of different learners, AI help teachers to provide data informed teaching. The most important thing is that according to the traditional method all student were given the same worksheet, but AI can provide questions according to the performance of the students and can make them difficult or simple. However, the role of teacher cannot be replaced because pedagogy is not only technology human interaction, values, creativity, and critical thinking are also important. At present many teachers take help of AI to access essential services. NEP-2020 has also emphasized sustainable development and AI contribute to achieving this objective.

KEYWORDS – *Artificial Intelligence, Pedagogical Innovation, NEP – 2020*

INTRODUCTION

Education is not merely a teaching tool, but it is important to understand that AI is becoming a new form of education used in various ways making the learning process more effective. In this AI is not only changing the traditional role of teachers but is also transforming the entire process of education. With the use of Artificial Intelligence education is moving towards AI supported pedagogy. Earlier the technology was used through one medium to deliver some content, such as smart board videos, PPT, digital textbook etc. This means that AI was used as a medium for providing learning resources. However now AI can do much more, it can analysis students' performance, interaction, feedback, learning pathways and recommendations. In this topic, teachers, content, and students become responsible for their learning. For this, AI supported pedagogy can help teachers and students. Teachers can use AI generated data or information as a basis for making pedagogical decisions, one size fits all and

one size fits one approaches are discussed in this topic that's mean the same teaching approach cannot be suitable for every student. For example, a student may need one lesson and another student may need a different assessment or learning method. While talking about teachers, it can also be said that AI can help teachers in many ways like –

(1) To provide basic explanation to students
(2) To provide text based or deep learning
(3) To identify the practical needs of different students
(4) To help students reach an advanced level
(5) To identify the concepts that students find difficulties and provide appropriate support

In this way AI can become a pedagogical assistant for teachers. AI can provide support for pedagogical innovation and provide a strong foundation for teachers in their work. Now talk about assessment, quizzes, can be prepared and final judgement can be made on the basis of AI. Continue assessment can also be conducted instead of depending only on examination, students learning can be evaluated continuously. The performance of learners can be regularly monitored through an assessment model, and formative feedback can be provided so that students can improve their learning. It is possible that a student can be made better through this process, it can also help in understanding the learning process. AI does not only provide answer rather it makes the feedback loop faster and more responsive. With AI, the role of teachers does not become less important rather AI performs repetitive task while the teacher role becomes more focused on providing information, designing learning, facilitating learning and monitoring. Teachers can identify what material generated by AI is appropriate for a particular student and how reliable that material is the teacher also need to check the content generated by AI and determine whether it is appropriate or not Along with AI teachers also need pedagogical judgement. It is important to understand whether AI is actually improving students thinking or whether or it is creating dependency. AI should help students to develop critical thinking rather than simply depending on it for answer. The teacher's role remains important because there should be a balance between AI and teacher. The disadvantage of AI for learners can also become an opportunity for them. If a student uses AI only for searching, then through that search they may obtain the answer to any questions. Education should not be limited only to getting answers. Students thinking, questioning, reasoning, analysis, and conclusion making abilities should also be developed. AI has a five-dimensional accessibility aspect, including translation, speech to text, text to speech, personalized resources etc. Technology can provide learning resources according to the needs of different students with innovation and equity. AI and NEP-2020 both focuses on the use of technology in education. NEP-2020 should promote learner centered approach, flexibility, experiential learning, inclusion of students. and tech integration. These aspects can help in making education more accessible, flexible, inclusive and technology -integrated.

Objectives

(1) To discuss the role of Artificial Intelligence in Modern education.
(2) To examine the role of Artificial Intelligence in evaluation assessment and learning resources.
(3) To promote inclusive and sustainable development through Artificial Intelligence.

(4) To highlight the integration of AI in Education.

Research Methodology

The subject of the proposed research is based on systematic literature review design integrated with pedagogical innovation to analyze implication for teacher AI collaboration, learner autonomy and inclusive education. Used predefined inclusion and exclusion criteria which directly related with AI and practice of pedagogical to analyze process framework.

Literature Review

(1) Gian, Nguyen Mish. (2026). The Role of Artificial Intelligence in pedagogical Innovation and strategic Management in Higher Education. Journal of Artificial Intelligence and Technological Development – In this Author has explained how AI is being used at the pedagogical level or classroom level, management level, and institutional level. Author has discussed the benefits of AI, while also discussing algorithmic bias, privacy issues and issues related to technology. Ethical boundaries and ethics by design have also been included, but some gaps can also see here that is Proper integration of NEP-2020 was not found. Empirical evidence in the Indian context is included which not sufficient. There is no quantitative measurement of student performance.

(2) Neto, Alcides Feitosa. (2026) Artificial Intelligence in the pedagogical process: Technological innovation, Transparency, Limits and Responsibility. IOSR Journal of Research and Method in Education. Here the writer has described the Integration of AI in the pedagogical process, ethical issues of different elements, supervision, evaluation, responsibility and intellectual authorship. It also described that there is no empirical study on actual students. There is not detailed study of the actual experiences of teachers and no sufficient evidence regarding students' perception. There is no specific analysis of these, so the Indian context of Education has not been given a specific focus. There is no comparative evaluation of specific AI tools.

(3) Moin, Md Alaun. (2026) Curriculum Design and pedagogical Innovation in the Time of Artificial Intelligence: Conceptual and Empirical Investigation, Journal of Applied Artificial Intelligence in Education. Author explained in his Article to Integration of AI within the curriculum, pedagogical Innovation, assessment redesign, teacher AI competency, ethical governance, ethical awareness and transparency. Equity and student-centered education have also been included. But there are also some research gaps that is the sample consists of 100 stakes holders, The authors have mentioned the limitation of the sample and it is not generalizable. It is a cross-sectional study, which is a very important limitation. A longitudinal study should be conducted; there is no systematic empirical analysis of NEP-2020.There is also no framework for the integration of the Indian Knowledge System (IKS).

(4) Guan, Chong. (2020) Artificial Intelligence innovation in Education: A twenty-year data-driven historical analysis. International Journal of Innovation Studies – This paper explained the evolution of AI and Deep Learning in Education research trends, students profiling, student performance, dropout risk, prediction, academic achievement, paradigm shifts and personalized learnings. There are some research

gaps identified by me which is there is no connection with the research papers on the Indian Knowledge system, there is no direct empirical measurement of teacher competency, Indian Education policy context has not been covered, the alignment of NEP-2020 with the Indian Education system has not been examined.

Integration of AI in Education with Reference to NEP 2020

I want to say that the use of AI tools in education is not the only importance of it in education. The aim is to incorporate AI into the curriculum, pedagogy, assessment, teacher development, administration and learner development of the educational system. The objective is to understand the development of AI and to use it in the classroom to search the content and provide information to the student so that the learning of the students can become better. The use of AI tools should be done according to the educational needs. Before using it, pedagogical objectives and appropriate its applications should be identified. Human supervision should be ensured and the learning outcome should be seen as an AI tool. It should be used in the classroom to achieve the objective can be better. For student's educational use is important in Artificial Intelligence, it can help in formative assessment, question generation, feedback and learning process analysis. UNESCO has also said that this technology of AI learning and learning assessment can support but for this learning methodology needs thoughtful integration it provides teachers with customized content, learning designs, facilitator methods and evaluators, which can be further developed.

AI and NEP-2020 are related to each other where AI is used as a technology for student centered, flexibility and inclusiveness. Technology enabled education provides a learner centered approaches and helps learners according to their needs through content and feedback. Multidisciplinary approach of learning is also related to the boundaries of NEP-2020 technologies. It is critical thinking and creativity are introduced in this context. NEP-2020 mainly focuses on students critical thinking, problem solving and creativity. AI can also change the role of the teacher into a facilitator and mentor. NEP 2020 focuses on examination and evaluation through assessment and it also focus on learning outcomes and competencies .AI has the potential to make education inclusive by using translation, speech to text, text to speech, accessibility tools to address learning needs. Learners can get support according to their needs through this NEP 2020 provides opportunities to promote inclusiveness. Scientific study of student performance, dropout rates, teaching quality and curriculum effectiveness has become possible with the assistance of AI. In qualitative research, interviews, and documents can also be analyzed automatically. Although AI is extremely useful, problems such as data security, digital inequality, lack of technical training and ethical issues also arise. In conclusion. it can be said that through the combined efforts of AI and NEP2020, research methodologies are becoming more advanced, effective, and reliable. If technology is used in a balanced and ethical manner, Indian education and research can achieve new heights at the global level. Artificial Intelligence has not only changed the nature of education but also made the methodologies of educational research more scientific, rapid and accurate. The National Education policy 2020 (NEP-2020) places special emphasis on research, innovation and evidence -based policy making. This research article analyzes AI based research methodologies, their nature, utility, possibilities, and challenges. Research is the backbone of

any education system. NEP-2020 encourages the development of a research culture, innovation and multidisciplinary studies in India. AI has made traditional research methodologies more advanced, data – driven and authenticate. Artificially Intelligence is a technology in which machines are capable of learning, analyzing reasoning and making decisions. Through the coordination of AI and NEP-2020, Indian educational research can become more scientific, reliable and globally oriented. In the coming time, the success of research will depend on how wisely and ethically we use technology.

Conclusion

In this topic, many contents have been covered whereas the conclusion of this research paper is as by using AI, the learning process can be made more adaptable, interactive, inclusive, and learner centered. Through this, AI can change learning activities according to the needs of learners. Its move away from the one size fits all approach and making learning flexible. In this assessment is not only evaluation but is also a part of learning progress. It has the possibility of inclusiveness for all type of learner, which promotes equity and provides learning opportunities to all learners. The combination of NEP-2020 and Artificial Intelligence is leading Indian educational research into a new era. It is not only advancing research methods but also providing new opportunities to students, teachers and policymakers. By overcoming the challenges with effective solutions and moving forward, it is certain that future education will be more inclusive, data driven and effective. The present scenario of technology is the new era of information and communication technology. The nature of education is no longer limited to being classroom centered, it has now become digital, online and technology assisted. AI has made the teaching -learning process more personalized, effective and accessible. NEP-2020 also gives priority to technological integration and digital empowerment in education.

STUDENT ENGAGEMENT AND WELL-BEING

Rukmimi K.,
M.A., M.Ed., M.Phil, Teacher Educator, S .J .G .College of Education, Rukminik2070@gmail.com
Dr. Karunakara N.N,
M.A., M.Ed, P.hd. PRINCIPAL, S .J .G .College of Education, Murughamutt, Anandapuram, Sagara (tq), shivamogga (DST). Karunakara2070@gmail.com

Abstract

Student engagement and well-being are closely interconnected components that significantly influence students' academic success, personal growth, and overall quality of life in educational settings. Student engagement refers to the level of interest, motivation, participation, and involvement that students demonstrate in academic and extracurricular activities. Well-being, on the other hand, encompasses students' physical, mental, emotional, and social health, as well as their overall sense of happiness, satisfaction, and belonging. Understanding the relationship between these two dimensions is essential for creating supportive and effective learning environments. This paper explores the relationship between student engagement and well-being and how active participation in learning activities can influence students' overall health and educational experiences. Higher levels of engagement can promote motivation, confidence, social connectedness, and a sense of purpose, which may contribute positively to students' emotional and psychological well-being. Similarly, students who experience positive well-being are more likely to participate actively in classroom activities, develop meaningful relationships with peers and teachers, and demonstrate greater motivation toward their studies. Thus, engagement and well-being can reinforce each other and create a positive cycle that supports academic and personal development. The paper also highlights the importance of supportive teaching practices, positive peer relationships, inclusive learning environments, and opportunities for student participation in promoting both engagement and well-being. Conversely, low engagement, academic pressure, social isolation, and inadequate institutional support may negatively affect students' mental health and academic performance. Therefore, educational institutions should adopt holistic approaches that address both academic and well-being needs. By recognizing and strengthening the connection between student engagement and well-being, institutions can enhance academic achievement, student retention, resilience, and overall educational satisfaction. Ultimately, fostering an environment where students feel motivated, supported, valued, and connected can contribute to their long-term success and healthier educational experiences.

Key words: student engagement and well-being, resilience

INTRODUCTION:

Education plays a crucial role in shaping students' academic success, personal development and future opportunities. Student engagement and well-being refers to the level of students active participation, interest and involvement in learning activities. Student well-being refers to the overall physical, emotional, psychological and social health of students. Students engagement could be described as the holy grail of learning due to its relationship with positive educational outcomes both inside and outside of school. student engagement is a part

of educationally purposive activities. It is correlated to positive outcomes of student success and development like satisfaction, persistence academic achievement and social engagement.

MEANING OF STUDENT ENGAGEMENT AND WELL-BEING

- Student engagement and well-being refers to a student's active participation in learning and their overall physical, mental and emotional health within an educational setting.
- Student engagement can be understood as a developmental process comprised of student thoughts, feelings, beliefs, and behaviors in relation to the schooling context and his or her lifelong learning trajectory.
- Student well-being is a positive state of mental, emotional, and physical functioning that allows learner to thrive.
- Well-being is experiencing happiness, life satisfaction, joy, and positive emotions while avoiding severe distress.
- Having a sense of purpose, personal growth, autonomy, and fulfilling one's true potential.
- **Resilience** means the ability to cope with academic pressure, setbacks, failures, or personal problems and still remain motivated and continue their studies.

Importance of student engagement

- **Better Memory and Learning**

Active engagement helps students process and retain information more effectively. Students who participate in discussions, practical activities, problem-solving exercises, and collaborative learning are more likely to understand and remember concepts.

- **Higher Academic Achievement**

Engaged students generally devote greater effort to academic tasks and are more likely to complete assignments and prepare for examinations. Consistent participation can therefore contribute to improved academic performance.

- **Development of Critical Thinking**

Engagement encourages students to question information, analyze problems, discuss different perspectives, and develop solutions. These activities promote critical thinking and higher-order cognitive skills.

- **Positive Behavior**

Students who feel connected to their educational environment are more likely to demonstrate positive classroom behavior. Engagement can reduce disengagement, absenteeism, and disruptive behavior.

- **School and Institutional Connection**

Engagement helps students develop a sense of belonging to their school, college, or university. When students feel that they are respected and valued members of an educational community, they are more likely to participate actively.

- **Increased Confidence**

Successful participation in academic and social activities can improve students' self-confidence and self-efficacy. Completing difficult tasks and contributing to classroom discussions can help students develop belief in their own abilities.

Importance of well-being

Well-being is a multidimensional construct that includes emotional and social health. Also it influences not only academic performance but also student's ability to life challenges.

- **Mental Health:** mental health is a critical element of student well-being. high level of stress, anxiety, and depression can hinder a student's ability to engage fully in the educational experience. Positive mental health promotes resilience and adaptive coping mechanisms that enhance engagement.
- **Physical Health:** It affects cognitive function and, consequently, engagement. Good nutrition, regular exercise, etc are vital for maintaining energy levels and focus.
- **Social Relationships:** social support from peers, family, and educators plays key role in influencing student well-being. Strong relationship foster a sense belonging and community, both impacting engagement and emotional health.
- **Personal Agency:** Autonomy and a sense of control over one's life choices significantly and enhance well-being. When students feel empowered to make decisions regarding their loving.

DIMENSIONS OF ENGAGEMENT

- **Behavioral engagement:** Involves attendance, rule-following, and participation in school activities, which builds self-efficacy and confidence.
- **Emotional engagement:** Reflects feelings of belonging and interest toward peers and teachers ,serving as a primary drive for overall student happiness.
- **Cognitive engagement:** Represents the mental investment and psychological effort a learner dedicates to mastering difficult concepts.

DIMENSIONS OF WELL-BEING

- **Emotional:** Emotional well-being involves recognizing and managing emotions, coping with stress, developing confidence, and maintaining resilience.
- **Physical:** Physical well-being includes healthy nutrition, sufficient sleep, physical activity, personal health, and healthy lifestyle practices.
- **Social:** Social well-being involves developing supportive relationships with peers, family members, teachers, and the wider educational community.
- **Intellectual:** Intellectual well-being involves curiosity, creativity, critical thinking, learning new skills, and developing an interest in lifelong learning.
- **Spiritual:** Spiritual well-being may involve finding meaning and purpose in life and developing personal values and beliefs. It does not necessarily refer only to religious practices.
- **Environment:** Feeling safe, comfortable, and connected to the physical environment, including the classroom, campus, home, and community.
- **Occupational:** Experiencing satisfaction and purpose in academic work, setting meaningful goals, managing responsibilities, and maintaining a healthy balance between study and other activities.

- **Financial:** Having basic financial security, developing responsible money-management skills, and feeling confident about managing financial needs and decisions.

THE INTERCONNECTEDNESS OF ENGAGEMENT AND WELL-BEING

Student engagement and well-being are closely interwoven dimensions of the educational experience, reflecting how learners interact with academic tasks, peers and institutional supports, and how these interactions influence their psychological health. Engagement is characterized by students' vigor, dedication and absorption in their studies, whereas well-being encompasses positive effect, life satisfaction and the absence of distress such as burnout. Engaged students tend to exhibit high levels of well-being; they are more likely to have positive relationships, practice good mental health and adopt healthier lifestyles. Likewise, students with better well-being engage more deeply in their educational experiences.

1. **Positive outcomes of engagement:** Students who are engaged in their learning often report greater satisfaction with their educational experience, leading to higher retention rates and improved academic performance, active participation in class and extracurricular activities can foster a sense of achievement and purpose, contributing positively to overall well-being.
2. **Impact of well-being on engagement :** Students with high level well-being are more likely to participate actively in their academic environment. Positive emotions, reduced stress, and supportive relationship enhance students cognitive and emotional investments in their studies, thereby increase engagement. Several factors influence the extent to which students engage in their studies and their levels of well-being.

HOW WELL-BEING BOOSTS ENGAGEMENT

The connection goes both ways. Students who feel healthy and happy have more energy for school.

- **Positive moods:** Good emotional health increases motivation to learn.
- **Better focus:** students without burnout or severe distress can invest more cognitive effort into though tasks.
- **Lower stress and burnout:** Managing stress and preventing burnout keeps workers positive, motivated, and willing to go the extra mile.
- **Grater loyalty:** When get the supports learners feel cared for and twice as likely to stay engaged.
- **Better problem –solving:** A healthy balanced mental state helps to think creatively and solve hard problems.

HOW ENGAGEMENT BOOSTS WELL-BEING

When student actively participate in school, their mental health improves in clear ways:

- **Lower stress:** Engaged learners find better ways to handle anxiety and bounce back from failure.
- **Higher confidence:** taking part in group tasks and discussions builds self-esteem.
- **Stronger connections:** Working with friends and mentors creates a safe community network.

- **Sense of purpose:** connecting daily tasks to a larger goal gives people meaningful direction, which increases life satisfaction.
- **Autonomy and control:** having a say in how work gets done reduces frustration and prevents chronic stress.
- **Flow and immersion:** being deeply absorbed in an activity –know as flow- helps quiet anxious thoughts and cultivates positive emotions.
- **Reduced burnout:** Higher involvement and motivation lead to lower emotional exhaustion and fewer stress – related health complaints.

FACTORS INFLUENCING STUDENT ENGAGEMENT AND WELL-BEING

- **Teaching practices :** Effective teaching practices, such as differentiated instruction, active learning and fostering a positive classroom environment, enhance student engagement. Educators who build positive relationships with students and who demonstrate enthusiasm for their subjects typically see high engagement levels.
- **School Environment** : A supportive and inclusive school culture can significance boosts student well-being engagement. Safety, respect, and a sense of community are essential elements of an environment that encourages students participation.
- **Parental Involvement**: Families play an important role in student engagement and well-being. Active parental involvement can promote academic success and emotional support, reinforcing positive attitudes toward learning.
- **Peer influence** : peers significantly impact each others engagement levels and well-being. Supportive peer relationships can enhance social engagement with negative interactions may lead to disengagement and lower well-being.

ROLE OF TEACHERS AND EDUCATIONAL INSTITUTIONS

Teachers and educational institutions have a significant responsibility in promoting student engagement and well-being. Teachers can create engaging classrooms by using interactive teaching methods, encouraging questions, recognizing student achievements, and providing constructive feedback.

Educational institutions should also create opportunities for students to participate in sports, cultural activities, clubs, leadership programs, and community activities. Such experiences can support social development and confidence.

Counseling and mental health support should be accessible to students who experience significant academic or personal difficulties. Institutions should encourage students to seek help without fear of stigma.

Student voice is another important element. Students should have opportunities to express their opinions about learning activities, institutional policies, and support services. Giving students an appropriate degree of autonomy can strengthen their sense of belonging and responsibility.

NEP 2020 Recommendations Related to Student Engagement and Well-Being

The **National Education Policy (NEP) 2020** emphasizes holistic development rather than focusing only on academic achievement.

- **Holistic development:** Education should support students' intellectual, emotional, social, physical, and ethical development rather than concentrating only on examination results.
- **Student-centered learning:** NEP 2020 promotes engaging and interactive learning experiences in which students actively participate in the learning process. Curriculum and pedagogy should encourage creativity, critical thinking, and meaningful participation.
- **Mental health and well-being:** The policy recognizes psycho-social well-being, good health, fitness, and emotional development as important components of quality education.
- **Sports and physical activities:** Students should have opportunities to participate in sports, physical education, cultural activities, clubs, and other activities that support physical and social well-being.
- **Counseling and emotional support:** NEP 2020 recommends counseling systems in educational institutions to help students manage stress, emotional difficulties, and adjustment-related concerns.
- **Positive and supportive learning environment:** Schools and higher education institutions should provide safe, inclusive, stimulating, and supportive environments where students feel respected and valued.
- **Student participation:** Students should receive opportunities to participate in sports, arts and culture clubs, eco-clubs, activity clubs, community service, and other activities. Such participation can strengthen engagement, confidence, belonging, and social development.
- **Inclusive education:** NEP 2020 emphasizes equitable and inclusive educational opportunities for students from different social, economic, and educational backgrounds.
- **Flexible curriculum:** Greater flexibility and choice in learning can help students pursue their interests, abilities, and aspirations, thereby increasing motivation and engagement.
- **Experiential learning:** Learning through activities, projects, discussions, practical experiences, and problem-solving is encouraged to make education more meaningful and engaging.
- **Teacher development:** NEP emphasizes continuous professional development of teachers so that they can use effective and innovative teaching approaches.
- **Reduced examination pressure:** The policy encourages competency-based and formative assessment and seeks to move away from excessive dependence on high-stakes examinations.
- **Life skills and resilience:** Education should help students develop communication, cooperation, problem-solving, decision-making, and other life skills that enable them to cope with challenges and develop resilience.

CONCLUSION

Student engagement and well-being are essential and interconnected aspects of a successful educational experience. Student engagement involves students' active participation, interest, motivation, and commitment to learning, while well-being includes their physical, emotional, psychological, social, and intellectual health. The discussion in this paper highlights that these two factors influence one another and play an important role in students' academic achievement, personal growth, and overall development. Students who are actively engaged in learning are more likely to experience greater confidence, satisfaction, motivation, stronger relationships, and a sense of purpose. At the same time, students with positive well-being are more capable of concentrating, participating in classroom activities, managing academic pressure, and maintaining motivation toward their studies. Therefore, engagement and well-being can create a positive cycle in which one strengthens the other. In conclusion, promoting student engagement and well-being is essential for creating meaningful, supportive, and effective educational experiences. When students feel valued, connected, supported, and motivated, they are more likely to succeed academically and develop resilience to overcome challenges. Thus, educational institutions, teachers, families, and peers should work together to foster environments that promote both active engagement and positive well-being, ultimately helping students achieve sustainable academic and personal success.

ARTIFICIAL INTELLIGENCE IN SOCIAL SCIENCES AND HUMANITIES

Dr. K Channakrishnaiah
Associate Professor, Shankaragowda College of Education
Mandya, E-MAIL- dr.channushylaja@gmail.com

Abstract

Artificial Intelligence (AI) is revolutionizing education by offering creative methods for teaching and learning in a variety of fields, including social science. With a focus on how AI may improve student engagement, critical thinking, personalized learning, and access to a variety of educational resources, this article explores the use of AI in social science education. Teachers may create interactive learning exercises, analyze social data, create educational resources, and provide students fast feedback with the use of AI-powered solutions. These technologies can also help with data analysis, virtual debates, simulations, and the investigation of complicated social topics from several angles in social science education. But integrating AI also raises issues with academic integrity, bias, false information, data privacy, digital inequality, and the evolving role of educators. Thus, proper teacher training, ethical standards, digital literacy, and critical assessment of AI-generated information are necessary for the effective usage of AI. In order to provide more inclusive, engaging, and learner-centered social science education, the essay makes the case that AI should support teachers rather than take their place. Students' analytical, digital, and critical-thinking abilities can be enhanced by thoughtful AI integration, which also equips them to comprehend and act ethically in a society that is becoming more and more reliant on technology.

Keywords: *Artificial Intelligence (AI), Social Science Education and analytical*.

Introduction

The sector of education is undergoing major changes as a result of the quick growth of artificial intelligence (AI). Teaching, learning, assessment, content development, and educational decision-making are all being supported by AI-based tools. Teachers are required to not only comprehend the potential of AI in this evolving educational environment, but also to apply it ethically and successfully to enhance students' educational experiences. There are many prospects for the effective integration of AI in social science education, which focuses on society, human behavior, culture, politics, economics, history, and social interactions. Teaching social science frequently necessitates that students grasp difficult ideas, consider other viewpoints, analyze data, and hone their critical and analytical thinking abilities. It can occasionally be challenging to relate these ideas to students' real-world experiences when using traditional teaching approaches. Through interactive learning exercises, individualized materials, virtual simulations, data analysis, intelligent tutoring systems, and AI-assisted conversations, AI can open up new possibilities. These programs can assist students in delving deeper into social issues and interacting with course content in a way that best suits their unique needs and skills. AI can help social science instructors with lesson planning, creating educational resources, evaluating students, and giving feedback. AI tools can be used by

educators to create inquiries, arrange data, create lesson plans, and pinpoint learning challenges. AI should not, however, be seen as a simple substitute for traditional instruction or the function of the instructor. Values, ethical reasoning, interpretation, empathy, and comprehension of various human experiences are all part of social science education—areas where human judgment and instructor supervision are still crucial. **Importance in AI-Based Social Science Education**

Artificial intelligence (AI) has emerged as an essential technical resource in modern schooling. Its application in social science education can benefit both teachers and students by making the teaching-learning process more interactive, individualized, accessible, and engaging. Because social science is concerned with human society, culture, history, politics, economics, citizenship, and social interactions, AI can give new avenues for investigating difficult challenges and integrating classroom learning to real-world scenarios.

1. **Enhances Learning Experience**

AI can make social science learning more interactive through simulations, virtual environments, digital storytelling, interactive questions, and educational applications. These approaches can help students understand difficult concepts more easily.

2. **Supports Personalized Learning**

Students differ in their learning abilities, interests, and pace. AI can provide differentiated learning materials and activities according to individual needs. This can help learners receive additional explanations, practice, and resources when required.

3. **Promotes Critical Thinking**

AI can expose students to multiple perspectives on social, political, economic, and cultural issues. Teachers can use these resources to encourage students to compare viewpoints, examine evidence, identify assumptions, and develop independent conclusions.

4. **Facilitates Fast Information Access**

Students may find, arrange, summarize, and investigate vast amounts of knowledge with the use of AI tools. In social science, where students regularly work with historical records, statistics, social studies, case studies, and research materials, this is especially helpful.

5. Increases Student Involvement

Activities that make use of technology can boost students' engagement and interest. AIpowered tests, interactive learning exercises, conversational tools, and simulations can make the classroom more interesting..

6.Assists Teachers

Lesson plans, discussion topics, exercises, worksheets, case studies, and evaluation materials can all be created with the help of AI. Teachers can spend more time engaging with kids as a result of the everyday workload being lessened.

7. Promotes Research Abilities

AI can assist students investigate research subjects and expose them to a variety of knowledge sources. Students can learn how to develop questions, gather information, compare sources, and assess evidence with the right pedagogical direction.

8. Makes Complex Social Issues Easier to Understand

Numerous social science ideas entail intricate connections between various elements. In order

to help students comprehend topics like population change, economic inequality, migration, political systems, and social transformation, artificial intelligence (AI) can aid with data presentation, visualization, and simulation development.

9. Promotes AI and Digital Literacy

AI in social science education aids in the development of digital abilities that are becoming more and more important in social, professional, and academic contexts. Pupils can understand how AI functions, identify its limitations, and make responsible use of it

10. Encourages Inclusive Education

AI-based educational resources can support students with varying learning needs and offer various learning material types. AI can help create more inclusive learning opportunities when used carefully.

Role of Teacher in AI-Based Social Science Education

Artificial Intelligence (AI) is creating new possibilities in education by supporting teaching, learning, assessment, research, and educational management. In social science education, AI can provide access to information, interactive learning resources, data analysis, simulations, and personalized learning.

1. Teacher as a Facilitator

The teacher facilitates learning by helping students use AI tools appropriately. Instead of simply transferring information, teachers create opportunities for students to explore social science topics, ask questions, investigate problems, and construct knowledge independently.

2. Teacher as a Learning Guide

Students may obtain large amounts of information from AI, but they may not always know how to interpret it. Teachers guide students in selecting relevant information, understanding concepts, comparing viewpoints, and connecting knowledge with real-life experiences.

3. Teacher as a Critical Thinker and Promoter of Critical Thinking

Social science involves different opinions, interpretations, and perspectives. Teachers encourage students to critically examine AI-generated information and identify facts, assumptions, opinions, and possible biases. They help learners develop logical reasoning rather than accepting information automatically.

4. Teacher as a Content Expert

Teachers possess subject knowledge that enables them to judge whether AI-generated material is accurate, relevant, and appropriate. They can correct misconceptions and provide explanations when AI-generated responses are incomplete or misleading.

5. Teacher as a Curriculum Designer

Teachers determine how AI can be incorporated into the social science curriculum. They select appropriate tools and learning activities according to curriculum objectives, students' educational levels, and classroom requirements.

6. Teacher as an Instructional Designer

Teachers can use AI to support the preparation of lesson plans, worksheets, questions, case studies, projects, simulations, and learning materials. They refine AI-generated resources and adapt them to students' needs rather than using them without evaluation.

7. Teacher as a Mentor

Students need personal guidance and encouragement during the learning process. Teachers act as mentors by understanding students' interests, abilities, difficulties, and aspirations. They provide emotional and academic support that AI cannot fully provide.

Conclusion

Artificial Intelligence (AI) is becoming a key instrument for changing social science teaching. Teaching and learning can become more interactive, adaptable, customized, accessible, and interesting with its use. AI can help students with knowledge exploration, comprehension of difficult ideas, data analysis, research skill development, and instant feedback. Additionally, it can help teachers with lesson planning, learning material preparation, assessment, and the creation of creative classroom activities. Through the development of digital literacy, critical thinking, creativity, problem-solving skills, and responsible citizenship, AI-based social science education has the potential to equip students for a technologically advanced society. The goal of education in the future should be to establish a harmonious coexistence of artificial and human intelligence.

Abstract

The present study investigates the impact of the 5E lesson plan–based constructivist approach (Engage, Explore, Explain, Elaborate, and Evaluate) on the academic achievement of secondary school students in Social Science. Grounded in constructivist learning theory, the study emphasizes learner-centered instruction, active participation, and experiential learning as opposed to traditional teacher-centered methods. A quasi-experimental design was adopted, involving two groups: an experimental group taught through the 5E instructional model and a control group taught using conventional teaching methods of 9th grade students from CBSE. The sample consisted of secondary school students selected through purposive sampling. Data were collected using a standardized achievement test administered as both pre-test and post-test. The collected data were analyzed using appropriate statistical techniques such as mean, standard deviation, and t-test to determine the significance of differences between groups. The findings revealed that students exposed to the 5E constructivist approach demonstrated significantly higher academic achievement compared to those taught through traditional methods. Additionally, the approach fostered better conceptual understanding, critical thinking, and student engagement in Social Science learning. The study concludes that the 5E lesson plan–based constructivist approach is an effective pedagogical strategy for enhancing academic achievement among secondary school students. It recommends the integration of constructivist models in classroom teaching and teacher training programs to improve the quality of Social Science education.

Keywords: *5E Model, Constructivist Approach, Social Science Education, Academic Achievement, Secondary School Students, creativity intelligence and interest.*

Introduction

Education in the twenty-first century emphasizes learner-centered approaches that promote critical thinking, creativity, collaboration, and active participation among students. Traditional methods of teaching in Social Science often rely on rote memorization and teacher-centered instruction, which may limit students' understanding and application of concepts in real-life situations. In response to these challenges, constructivist approaches to teaching have gained significant importance in modern pedagogy. Constructivism views learning as an active process in which learners construct knowledge through experience,

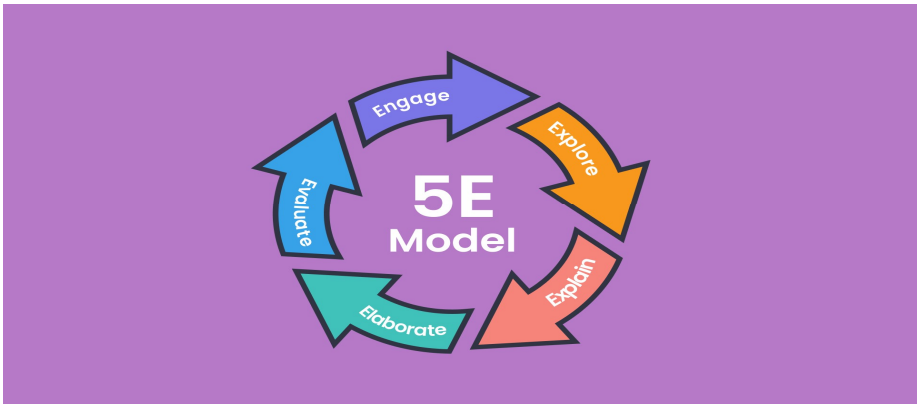
interaction, inquiry, and reflection.

Among the various constructivist models, the 5E lesson plan model has emerged as an effective instructional approach for enhancing classroom learning. Developed on the principles of constructivist theory, the 5E model consists of five phases: Engage, Explore, Explain, Elaborate, and Evaluate. This model encourages students to participate actively in the learning process, connect prior knowledge with new experiences, develop conceptual understanding, and apply knowledge meaningfully. The role of the teacher shifts from being a transmitter of knowledge to a facilitator of learning.

Social Science, as a school subject, plays a vital role in developing social awareness, democratic values, critical understanding, and problem-solving abilities among secondary school students. However, many students perceive Social Science as theoretical and less engaging when taught through conventional lecture methods. Therefore, innovative teaching approaches are required to make the subject more interactive, meaningful, and student-centered. The 5E lesson plan-based constructivist approach provides opportunities for experiential learning, discussion, collaborative activities, and reflective thinking, thereby improving students' academic achievement and interest in the subject.

Academic achievement is considered one of the important indicators of effective teaching and meaningful learning. Several educational studies have highlighted that constructivist teaching approaches significantly improve students' understanding, retention, motivation, and performance compared to traditional methods. In the context of secondary education, where learners undergo cognitive and social development, the implementation of the 5E instructional model can greatly influence their learning outcomes in Social Science.

The present study focuses on examining the impact of the 5E lesson plan-based constructivist approach on the academic achievement of secondary school students in Social Science. The study aims to compare the effectiveness of constructivist teaching with conventional teaching methods and to understand how active learning strategies contribute to improved academic performance. The findings of this study may provide valuable insights for teachers, curriculum planners, and educational researchers in adopting innovative pedagogical practices for enhancing the quality of Social Science education.



Need and significance of the study:

Bybee and colleagues translated decades of research into a brief and memorable set of five words that instructors could actually remember and use. The 5E model team reasoned that to

have significant impact on classroom instruction, a model would need to have a more tool-like quality than most scholarly models did at the time (Bybee et al., 2006 blue right-pointing triangle). The 5E model is based on both a conceptual change model of learning and a constructivist view of learning.

The former asserts that for conceptual learning and enduring understanding to occur,
the learner must become aware of and dissatisfied with their prior ideas about a topic, become receptive to new ideas, and then integrate new information encountered in a classroom into their existing conceptual framework (Posner et al., 1982 blue right-pointing triangle).

The former asserts that for conceptual learning and enduring understanding to occur,
the learner must become aware of and dissatisfied with their prior ideas about a topic, become receptive to new ideas, and then integrate new information encountered in a classroom into their existing conceptual framework (Posner et al., 1982 blue right-pointing triangle).

Review of Related Literature

1. **Lena Ballone (2004)** implemented and reported on inquiry-based teaching in science education. These reports argue that inquiry needs to be a central strategy of all science curricula. Using a learning cycle approach in the classroom helps to facilitate inquiry practices because learning cycles focus on constructivist principles and emphasize the explanation and investigation of phenomena. Bybee (2015) argues that the 5E model is still an effective method for teachers to design science lessons aimed at meaningful understanding and active construction of knowledge.
2. **Kimberly D Tanner (2010)** described in order matters: using the 5E model to align teaching with how people learn. For many instructors he has mentioned about the order of ideas. With the increasing use of active-learning strategies, class sessions are moving minutes. So, what is the optional order for sequencing these elements to maximize student learning of biology.
3. **Canbazoglu Bilici et.al. (2016)** assessed pre service teachers‟ TPACK through observations and lesson plans. The results showed that the TPACK-focused Science Methods course had an impact on pre-service teachers' TPACK to varying degrees. Most importantly, the course helped teachers gain knowledge of effective usage of educational technology tools. Conclusion: Teacher education programs should provide opportunities to pre-service teachers to develop their TPACK so that they can effectively integrate technology into their teaching.
4. **Namdar Bahadir (2018)** The purpose of this study was to investigate and better understand pre service science teachers' (PSTs') practices when critiquing and revising 5E (engage, explore, explain, elaborate, and evaluate) lesson plans. A single instrumental case study approach was used. The participants adopted some critiques on the essential features of inquiry and inquiry orientation of the lesson plans, such as formulating explanations. However, they failed to address critiques on organizing data and evaluating explanations by considering alternative explanations. After the critique activity, the inquiry orientations of half of the lesson plans increased. Implications for science teacher education concerning the 5E lesson plan critique activities are discussed.

Objectives of the study

1. To develop and validate lesson plan based on Herbartian (traditional) and constructivist approach(5E) model in social science in 9th standard.
2. To find out the reaction of the students and teachers towards constructive approach model of teaching

1) Objective:

To develop and validate lesson plan based on Herbartian (traditional) and constructivist approach(5E) model in social science in 9th standard.

1. Development of Lesson Plan Based on Constructivist approach Model

The Constructivist approach was proposed by **Rodger Bybee and his team**, which emphasizes meaningful learning by connecting new knowledge with the learner's existing cognitive structure. In this study, lesson plans in **Social Science** were developed using the principles of the Constructivist approach Model.

The development process involved the following steps:

1) **Selection of Topic**:

Suitable topics from the Social Science syllabus were selected based on their relevance and importance for secondary school students.

2) **Identification of Learning Objectives**:

Specific instructional objectives were framed in terms of knowledge, understanding, and application.

3) **Preparation of Constructivist approach**

An introductory organizer such as a concept map, diagram, chart, short explanation, or question was prepared to activate students' prior knowledge.

4) **Presentation of Learning Material**:

The teacher presents the lesson content in a structured and organized manner using examples, explanations, and teaching aids.

5) **Integration of New Knowledge**:

Students relate the new concepts with their existing knowledge through discussion, questioning, and activities.

6) **Evaluation and Feedback**:

At the end of the lesson, evaluation techniques such as quizzes, questions, and assignments are used to assess students' understanding. Through these steps, lesson plans were systematically designed to facilitate **meaningful learning and better retention of Social Science concepts.**

1. Validation of the Lesson Plan:

After developing the lesson plans, they were validated by experts to ensure their academic quality, relevance, and suitability for classroom teaching.

The validation process included the following steps:

1. Selection of Experts:

Experts in Education, Social Science, and Teaching Methodology were selected from universities, teacher education institutions, and experienced school teachers.

2.Preparation of Validation Tool:

A validation checklist or rating scale was prepared to evaluate the lesson plans based on

criteria such as:

- Clarity of objectives
- Relevance of constructivist approach
- Logical sequence of content
- Appropriateness of teaching methods
- Use of teaching aids
- Student participation
- Evaluation techniques

3. **Expert Review:**
   The developed lesson plans were submitted to the experts for review and suggestions.
4. **Modification of Lesson Plans**:
   Based on the feedback and suggestions of experts, necessary modifications and improvements were made in the lesson plans.
5. **Finalization of Lesson Plans:**
   After incorporating expert suggestions, the lesson plans were finalized for implementation in the experimental study.
   Thus, the lesson plans based on the Constructivist approach Model were systematically developed and validated by experts. This ensured that the lesson plans were pedagogically sound, scientifically organized, and suitable for improving students' academic achievement in Social Science.

2). Objective

To find out the reaction of the students and teachers towards constructive approach model of teaching

Reaction of the Students and Teachers towards Constructivist approach Model of Teaching:

1. **Introduction:**
   The Constructivist approach Model of teaching, developed by David P. Ausubel, is an important instructional strategy that helps students learn new concepts meaningfully by relating them to their prior knowledge. In the present study, the Constructivist approach Model was implemented in the teaching of Social Science to secondary school students. After the implementation of the lessons, the reactions of both students and teachers were collected through informal discussions, observation, and feedback. The responses indicated that the model had a positive influence on the teaching–learning process.
2. **Procedure followed in getting Reactions of students and teachers:**
   In the present study, the reactions of students and teachers towards the Constructivist approach Model of teaching were collected to understand their opinions and experiences regarding the effectiveness of this instructional strategy in teaching Social Science individually and summarized as follows:
3. **Reaction of Students towards Constructivist approach Model**
   The reactions of students towards the Constructivist approach Model were largely positive. Students expressed that the use of constructivist approaches such as charts, concept maps, introductory explanations, and questions at the beginning of the lesson helped them

understand the topic better. It enabled them to connect the new information with their previous knowledge and experiences.

Many students reported that the lessons taught through the Constructivist approach Model were clear, systematic, and easy to follow. The introduction of the lesson through an organizer provided them with a general framework of the topic, which helped them to grasp the main ideas more effectively. As a result, students felt more confident in understanding complex concepts in Social Science.

Students also mentioned that this method made the class more interesting and engaging. The use of visual aids, diagrams, and structured explanations attracted their attention and increased their curiosity to learn the topic in depth. The discussions and questioning sessions during the lesson encouraged students to participate actively in the classroom.

Another important reaction from the students was that the model helped in better retention of the subject matter. Since the information was presented in a meaningful and organized way, students were able to remember the content for a longer period of time. Some students also stated that they were able to recall the concepts easily during tests and examinations.

Furthermore, students felt that the Constructivist approach Model improved their thinking and understanding skills. Instead of memorizing facts, they were able to understand the relationships between different concepts. This helped them to develop a deeper understanding of Social Science topics.

However, a few students initially found it slightly difficult to adjust to the new method because they were more familiar with the traditional lecture method. But after a few classes, they became comfortable with the approach and appreciated its effectiveness.

4. Reaction of Teachers towards Constructivist approach Model:

The reaction of teachers towards the Constructivist approach Model was also highly favorable. Teachers observed that the model helped them to present the lesson content in a more organized and structured manner. The use of an constructivist approach at the beginning of the lesson helped them to introduce the topic clearly and prepare students mentally for learning new information.

Teachers reported that students showed greater attention and interest during the lessons taught through this model. The students were more attentive and participated actively in classroom discussions. This made the teaching process more interactive and effective.

Another important observation made by teachers was that the model helped in improving students' comprehension of difficult concepts in Social Science. When the lesson began with a general overview or organizer, students were able to understand the details of the lesson more easily.

Teachers also felt that the Constructivist approach Model encouraged meaningful learning rather than rote memorization. Students were able to relate new concepts with their existing knowledge, which helped them to develop a better conceptual understanding of the subject.

In addition, teachers stated that the model provided them with an opportunity to use various teaching aids such as charts, diagrams, maps, and concept maps. These teaching aids made the lesson more effective and helped students visualize the concepts clearly.

However, some teachers pointed out that the preparation of constructivist approaches requires

additional time and effort. Teachers need to carefully plan the lesson and design appropriate organizers to make the teaching effective. Despite this challenge, teachers agreed that the benefits of the model outweigh the difficulties.

Teachers also mentioned that the Constructivist approach Model is particularly useful in subjects like Social Science, where concepts are interconnected and require a clear understanding of relationships between ideas.

Overall Reaction

Overall, both students and teachers showed positive reactions towards the Constructivist approach Model of teaching. Students found the method interesting, understandable, and helpful in improving their academic achievement and retention of knowledge. Teachers appreciated the model for its ability to promote meaningful learning, active participation, and better organization of teaching content.

The findings suggest that the Constructivist approach Model can be effectively used in the teaching of Social Science at the secondary school level. It not only enhances students' understanding of the subject but also improves the overall quality of the teaching–learning process.

Educational Implications

1) The educational research and training agencies at state and national level may plan for training programs, workshops and orientation courses on constructivist approach model for pre-service and in-service teachers and teacher educators to enable them to develop an understanding and the required skills for the proper implementations of the models in actual classroom situations at different levels.
2) Especially, due weightage may be given to the programs for teacher educators at D.Ed., B.Ed. and M.Ed. level as the concept of models of teaching has been included in the syllabi of the said courses are reorganized recently giving room to the concept of models of teaching.
3) The attention of the directorates of textbooks at state and national level may be drawn towards sufficient provisions for identification and inclusion of constructivist approaches in the textbooks of all subjects of different levels in order to increase the teaching learning output.
4) The Constructivist approach Model provides teachers with a method for improving their presentations and enhancing students' abilities to learn from them.

Conclusions:

The effectiveness of constructivist approach model can be observed through the findings of the present study which has promoted active reception learning in experimental group i.e., Constructivist approach Group. Logically well-structured. constructivist approaches have played desired roles in the facilitation of integrative reconciliation between new content and the existing cognitive structure, and hence the constructivist approach model proved superior to traditional or conventional method of teaching. In other words the process of attainment of meaningful information and ideas is directly influenced by the constructivist approach model. Thus, it is evident that modern methods like constructivist approaches and the constructivist approach based self-learning strategies are very effective and useful instructional techniques in

the present context of the system of education in India. Needs and aspirations of average and above average students in terms of development of their academic achievement, Interest, Intelligence and creativity are well taken care through constructivist approach model of teaching. Hope that the findings of the present study would help to the classroom practitioners, administrators and policy makers.

DIGITAL LIBRARIES AND THE FUTURE OF TEACHER EDUCATION

Vishwanatha G
Librarian, Kumadvathi College of Education
Shikaripura -577427, Shikaripura (Tq),Shivamogga Dist
Karnatak-INDIA, Email ID : kumadvathibedlibrary@gmail.com

Abstract

The rapid advancement of information and communication technologies has transformed higher education, particularly teacher education. Digital libraries have emerged as essential academic support systems for teachers, teacher educators, student-teachers and researchers, providing access to e-books, e-journals, online databases, multimedia resources and open educational resources. These services strengthen teaching, learning, research, professional development and lifelong learning while promoting flexible, accessible and learner-centred education. Digital libraries also encourage independent learning, critical thinking, research and innovation among student-teachers. This paper examines the concept, significance and major services of digital libraries in teacher education, highlighting their role in teaching-learning, research, professional development and information literacy. It also identifies challenges such as inadequate infrastructure, limited digital literacy and unequal access to technology, while exploring strategies and the future potential of digital libraries in the era of artificial intelligence and digital transformation.

Keywords: *Digital Libraries, Teacher Education, Digital Learning, Information Literacy, E-Resources, Educational Technology, Professional Development.*

Introduction

The twenty-first century has brought significant changes in the creation, storage, dissemination and use of information. Traditional libraries, once primarily centred on printed books and physical collections, have evolved into dynamic digital knowledge centres. Digital technologies now enable learners and researchers to access information resources anytime and from anywhere, making digital libraries an essential component of modern educational institutions. Teacher education plays a vital role in preparing competent teachers for schools and society. In the digital age, teachers require not only subject knowledge and pedagogical skills but also technological competence, information literacy, creativity and adaptability. Therefore, teacher education institutions must provide learning environments that help student-teachers develop these essential competencies. Digital libraries contribute significantly to this process by providing access to e-books, e-journals, theses, research reports, educational videos, online courses, institutional repositories and open educational resources. These resources enhance academic knowledge, research skills and awareness of contemporary developments in education. The growing importance of blended learning, online education and digital pedagogy has further increased the relevance of digital libraries. They support continuity in teaching, learning and research, particularly when physical access to institutions is limited. Thus, the effective integration of digital libraries can transform teacher education

by promoting personalized learning, collaborative research, innovation and continuous professional development.

Meaning and Concept of Digital Libraries

A digital library may be understood as an organized collection of digital information resources that are created, stored, managed and made accessible through electronic and network-based technologies. Unlike a traditional library, a digital library provides users with access to resources in electronic formats through computers, mobile devices and the internet.

Digital libraries may include:

- E-books and electronic textbooks
- E-journals and scholarly publications
- Online databases
- Digital repositories
- Theses and dissertations
- Conference proceedings
- Educational videos and multimedia resources
- Open educational resources
- Digital archives
- Online newspapers and magazines
- Research reports and project documents
- Learning management system resources

A digital library is not merely a collection of electronic documents. It is a system that facilitates the selection, organization, preservation, retrieval and dissemination of digital information. Effective digital libraries provide users with search facilities, metadata, subject gateways, remote access and user support services.

The concept of digital libraries is closely connected with the development of the knowledge society. In educational institutions, digital libraries function as important academic infrastructure by connecting learners and teachers with global sources of knowledge.

Objectives of Digital Library Services in Teacher Education

The major objectives of digital library services in teacher education institutions include:

1. To provide easy and timely access to quality academic and educational resources.
2. To support teaching, learning and research activities.
3. To promote independent and lifelong learning among student-teachers.
4. To develop information and digital literacy skills.
5. To provide access to current research and scholarly publications.
6. To support curriculum development and innovative pedagogical practices.
7. To facilitate remote and flexible access to information resources.
8. To promote collaboration and knowledge sharing.
9. To preserve institutional academic and research outputs.
10. To prepare future teachers for technology-enabled educational environments.

These objectives demonstrate that digital libraries have a broader educational role beyond the traditional function of storing and lending books.

Importance of Digital Libraries in Teacher Education

Digital libraries have become increasingly important in teacher education by supporting the development of academic, professional and technological competencies.

Access to Knowledge Resources: They provide student-teachers with access to books, journals and research publications on pedagogy, educational psychology, curriculum, assessment, inclusive education and educational technology.

Support for Flexible Learning: Twenty-four-hour access allows learners to use resources according to their individual needs and schedules, benefiting distance, working and blended-learning students.

Promotion of Independent Learning: Digital libraries encourage student-teachers to search, compare and evaluate information independently, promoting self-directed and lifelong learning.

Development of Research Competence: Access to journals, theses, dissertations and databases supports action research, educational research and evidence-based teaching.

Improvement of Teaching Quality: Teacher educators can use digital library resources to update their knowledge and enrich classroom teaching. Access to current literature enables them to incorporate new theories, teaching strategies and research findings into their instructional practices.

Major Digital Library Services for Teacher Education

Digital libraries can provide a variety of services designed to meet the academic and professional needs of teacher educators and student-teachers.

E-Book Services: Digital libraries provide access to electronic books on education, pedagogy, psychology, sociology, philosophy, technology and subject-specific teaching methods. E-books are convenient, searchable and easily accessible through computers and mobile devices.

E-Journal Services: Access to scholarly journals is essential for academic and research development. E-journals enable student-teachers and researchers to remain informed about recent developments in educational theory and practice.

Institutional Repositories: Institutional repositories preserve and provide access to the intellectual output of an institution. These may include research articles, dissertations, project reports, conference papers and faculty publications.

Digital Reference Services: Digital reference services enable users to receive academic assistance through electronic communication. Librarians can assist users in locating information, selecting databases and using digital resources.

Online Database Services: Academic databases provide access to specialized research literature. These resources are valuable for conducting literature reviews, research projects and advanced academic study.

Multimedia and Educational Resources: Digital libraries can provide access to educational videos, audio materials, simulations, presentations and interactive learning resources. Such materials are particularly useful for teacher education because they support the understanding of teaching methods and classroom practices.

Open Educational Resources: Open educational resources provide freely accessible teaching and learning materials. These resources can support teachers in developing lesson plans,

instructional materials and innovative classroom activities.

Remote Access Services: Remote access allows users to utilize library resources without physically visiting the institution. This service supports online, distance and blended learning.

Digital Libraries and the Teaching-Learning Process

Digital libraries can significantly enhance the teaching-learning process in teacher education by providing access to diverse learning materials such as research articles, case studies, educational videos and international publications. They promote active learning by encouraging student-teachers to search, evaluate and apply information, thereby developing critical thinking and inquiry skills.

Digital libraries also support collaborative and personalized learning through resource sharing, online discussions and access to materials based on individual academic needs. Furthermore, resources such as lesson plans, classroom videos, teaching demonstrations and case studies help student-teachers connect educational theory with practical teaching experiences.

Role of Digital Libraries in Developing Information Literacy

Information literacy is an essential competence for teachers in the digital age. It refers to the ability to identify information needs, locate relevant information, evaluate sources and use information ethically and effectively.

Digital libraries can help student-teachers develop the following competencies:

- Searching for reliable information.
- Using online catalogues and databases.
- Evaluating the credibility of digital sources.
- Identifying misinformation and unreliable content.
- Using citations and references appropriately.
- Understanding copyright and intellectual property.
- Avoiding plagiarism.
- Using information ethically.
- Organizing digital information.

Teachers who possess strong information literacy skills are better prepared to guide school students in the responsible use of information and technology.

Digital Libraries and Research in Teacher Education

Research is an important component of teacher education. Student-teachers and teacher educators require access to current and reliable information for conducting research studies.

Digital libraries support research by providing:

- Access to research journals.
- Literature review materials.
- Previous dissertations and theses.
- Research reports.
- Statistical and educational data.
- Citation and reference support.
- Institutional research repositories.

Digital access also makes it easier for researchers to study national and international developments. Researchers can compare educational systems, analyse current policies and

examine innovative teaching practices.

Furthermore, digital libraries support interdisciplinary research. Teacher education is closely connected with psychology, sociology, philosophy, technology and management. Digital resources enable researchers to access information across multiple disciplines.

Digital Libraries and Professional Development of Teachers

Professional development is a continuous process. Teachers must regularly update their knowledge and skills to respond to changes in curriculum, technology and society.

Digital libraries can support continuous professional development by providing access to:

- Online courses.
- Professional journals.
- Webinars and recorded lectures.
- Research publications.
- Educational policy documents.
- Teaching resources.

Through digital library services, teachers can engage in self-learning and professional reflection. They can also explore innovative practices used by educators in different parts of the world.

Digital libraries therefore contribute to the development of a culture of lifelong learning among teachers.

Emerging Technologies and the Future of Digital Libraries

The future development of digital libraries will be influenced by emerging technologies.

Artificial Intelligence: Artificial intelligence can improve information retrieval and user services. AI-based systems may provide personalized recommendations based on users' academic interests and information needs.

Cloud Computing: Cloud technology can improve the storage and accessibility of digital resources. It allows institutions to manage large collections and provide access from different locations.

Mobile Library Services: The increasing use of smartphones has created opportunities for mobile access to library resources. Mobile applications can make digital library services more convenient for students and teachers.

Data Analytics: Data analytics can help libraries understand user behaviour and improve services. Libraries can analyse resource usage and identify the academic needs of different groups of users.

Virtual and Immersive Learning: Virtual and immersive technologies may provide new opportunities for teacher education. Digital libraries could provide access to interactive simulations, virtual classrooms and immersive educational experiences.

Personalized Learning: Future digital libraries may become more learner-centred by providing personalized recommendations and adaptive learning resources based on individual academic needs.

Challenges in Implementing Digital Library Services

Despite their significant advantages, digital libraries face several challenges.

Inadequate Infrastructure: Many institutions lack sufficient computers, internet

connectivity, servers and technical facilities required for effective digital library services.

Digital Divide: Not all learners have equal access to digital devices and reliable internet services. This inequality may create barriers to the effective use of digital resources.

Lack of Digital Literacy: Some students and teachers may not possess sufficient skills to search, evaluate and effectively use digital information resources.

Financial Constraints: Subscription-based databases and digital resources can be expensive. Institutions may face difficulties in maintaining access to high-quality academic content.

Copyright Issues: Digital content must be used in accordance with copyright laws and licensing agreements. Institutions need to promote awareness about intellectual property and ethical use of information.

Cyber security and Privacy: Digital libraries must protect user information and institutional resources from unauthorized access, cyber threats and data breaches.

Resistance to Change: Some users may continue to prefer traditional methods of accessing information. Effective orientation and training are necessary to encourage the adoption of digital library services.

Strategies for Strengthening Digital Libraries in Teacher Education

Teacher education institutions should adopt systematic strategies to strengthen digital library services.

Develop Strong Digital Infrastructure: Institutions should provide reliable internet connectivity, sufficient computers, Wi-Fi facilities and secure digital platforms.

Conduct User Orientation and Training: Regular training programmes should be organized for student-teachers, faculty members and library professionals.

Promote Open Access Resources: Institutions should encourage the use of quality open-access journals, repositories and educational resources.

Integrate Digital Libraries with the Curriculum: Digital resources should be connected with classroom teaching, assignments, projects and research activities.

Strengthen Institutional Repositories: Teacher education institutions should preserve and showcase research publications, dissertations, conference papers and other academic outputs through institutional repositories.

Encourage Collaboration: Libraries should collaborate with faculty members, technology experts and educational institutions to improve services and resource sharing.

Develop Information Literacy Programmes: Information literacy should become an important component of teacher education programmes.

Ensure Inclusive Access: Digital library services should be accessible to all learners, including persons with disabilities and students from disadvantaged backgrounds.

Future Directions

The future of teacher education will be increasingly influenced by digital transformation. Digital libraries are likely to become integrated learning ecosystems rather than simply electronic collections of documents.

Future digital libraries may:

- Provide AI-assisted academic support.
- Offer personalized resource recommendations.

- Integrate with learning management systems.
- Support collaborative research environments.
- Provide interactive and multimedia learning resources.
- Strengthen open access to educational knowledge.
- Support multilingual information services.
- Provide mobile-first learning experiences.
- Promote inclusive and accessible educational resources.

The librarian's role will also continue to evolve. Future library professionals will function not only as custodians of information but also as digital learning facilitators, research support specialists, information literacy trainers and technology partners.

Teacher education institutions must therefore recognize digital libraries as strategic academic infrastructure for preparing future-ready teachers.

Conclusion

Digital libraries have the potential to transform teacher education by providing flexible access to knowledge, supporting research and professional development, promoting independent learning and strengthening information literacy. They enable student-teachers to access current educational resources and develop the competencies needed for teaching in a technology-driven society. Effective integration of digital library services requires adequate infrastructure, trained professionals, digital literacy and institutional support, while challenges related to access, affordability, copyright and cyber security must be addressed.

As future teachers need to learn continuously, evaluate information critically and integrate technology effectively, digital libraries can play a vital role in preparing competent, innovative and future-ready educators. Therefore, investment in digital library infrastructure and learner-centred services is essential for ensuring quality teacher education.

ARTIFICIAL INTELLIGENCE FOR SUSTAINABLE DEVELOPMENT: TRANSFORMING THE FUTURE

Shobha B.S
MBA. M.A. M.ED. Assistant Professor, S J G College Of Education, Murughamutt, Anandapuram. shobhabsraj@gmail.com

Abstract

Sustainable development, defined as meeting present needs without compromising future generations, faces critical challenges including climate change, poverty, resource depletion, and inequality. Artificial Intelligence (AI) has emerged as a powerful enabling technology to address these challenges. This paper explores the role of AI in advancing the United Nations Sustainable Development Goals (SDGs). It examines AI applications across environmental sustainability, social equity, and economic growth. The study analyzes AI-driven solutions in climate modeling, precision agriculture, renewable energy optimization, smart cities, healthcare, and education. While highlighting immense potential, the paper also discusses ethical concerns, digital divide, energy consumption of AI itself, and governance issues. Through case studies and current literature, the paper argues that responsible, inclusive, and transparent deployment of AI is crucial for achieving a sustainable and equitable future by 2030 and beyond. It concludes with policy recommendations for integrating AI into national sustainability strategies.

Keywords*: Artificial Intelligence, Sustainable Development, SDGs, Climate Change, Machine Learning, Green AI, Smart Cities, Precision Agriculture: Pros and Cons of using AI.*

I Introduction:

Key Pioneers

John McCarthy: Named the field, created early AI logic standards, and shaped computer science at Stanford and MIT.

Alan Turing: British mathematician who created the foundational concept of machine thinking and the Turing Test

Geoffrey Hinton: Often called a "Godfather of AI" for his modern breakthroughs in neural networks and deep learning:

Types of AI

Artificial intelligence is divided into seven types across two main categories: three based on **capabilities** and four based on **functionality**.

Based on Capabilities (What AI can do)

- **Narrow AI (Weak AI):** Systems designed to perform a single, specific task, like virtual assistants or spam filters. This is the only type of AI that exists today.
- **General AI (AGI):** AGI :Artificial General Intelligence it is equal human Intelligence A theoretical form of AI that can match human intellect across any task, possessing the ability to reason and think independently.
- **Super AI (ASI):** A hypothetical future AI that surpasses human intelligence and ability in every way. ASI: Artificial Super Intelligence that exceeds humans intelligence

Based on Functionality (How AI works)

- **Reactive Machines:** Basic systems that react only to current inputs with no memory of past experiences

, such as IBM's Deep Blue chess computer.

- **Limited Memory AI:** Systems that use recent past data and short-term memory to make decisions, like self-driving cars.
- **Theory of Mind AI:** A theoretical future AI that can understand human emotions, beliefs, and social cues.
- **Self-Aware AI:** A conceptual future stage where AI possesses actual consciousness and self-awareness.

The concept of sustainable development rests on three pillars: environmental protection, social inclusion, and economic prosperity. In 2015, the United Nations adopted 17 Sustainable Development Goals as a universal blueprint. However, progress has been slow due to the complexity and interconnection of global problems. Traditional methods are insufficient to process the massive data required for effective decision-making.

Artificial Intelligence, which includes machine learning, deep learning, natural language processing, and computer vision, offers unprecedented capability to analyze complex systems, predict future scenarios, and optimize resource use. AI is not a silver bullet, but it is a transformative tool. According to PwC, AI could add $5.2 trillion to the global economy by 2030 while reducing greenhouse gas emissions by 4%.

II Artificial Intelligence for Environmental Sustainability (Planet)

1. Climate Change Mitigation and Monitoring:

AI is revolutionizing climate science. Machine learning models can analyze satellite imagery, ocean data, and atmospheric sensors to predict extreme weather events with higher accuracy. IBM's Green Horizon and Google's Flood Forecasting use AI to predict floods and pollution levels days in advance. AI also helps in carbon capture by optimizing materials that absorb CO2 efficiently.

2. Energy Management:

One of the biggest sources of emissions is energy. Artificial Intelligence optimizes energy grids through demand forecasting and supply balancing. Deep Mind applied Artificial Intelligence to Google's data centers and reduced cooling energy consumption by 40%. For renewable energy, Artificial Intelligence predicts solar and wind power generation, helping integrate them into the grid. Smart grids using Artificial Intelligence can automatically route power where it is needed, minimizing waste.

3. Biodiversity and Conservation:

AI-powered computer vision is used in projects like Wildlife Insights, which automatically identifies animal species from camera trap images, helping conservationists track endangered species. AI drones monitor illegal deforestation and poaching in real-time in the Amazon and Africa.

4. Circular Economy and Waste Management:

Artificial Intelligence robots like AMP Robotics use computer vision to sort recyclable waste with 99% accuracy, far faster than humans. Artificial Intelligence platforms also help

companies design products for reuse and predict product life-cycles to promote a circular economy.

III. AI for Social Sustainability(People)

1.Precision Agriculture and Food Security (SDG 2):

To feed 9.8 billion people by 2050, we must increase food production by 60% with less land and water. AI enables precision agriculture. Sensors, drones, and Artificial Intelligence algorithms analyze soil moisture, nutrient levels, and crop health. Platforms like Microsoft's FarmBeats and John Deere's See & Spray provide farmers with exact recommendations on when to irrigate, fertilize, and spray pesticide, reducing water use by 30% and chemical use by up to 90%.

2. Healthcare (SDG 3):

AI improves access to quality healthcare, especially in remote areas. AI diagnostics can detect diseases like tuberculosis, malaria, and diabetic retinopathy from medical images with accuracy matching doctors. During COVID-19, Artificial Intelligence models like Blue Dot predicted outbreak zones. AI also accelerates drug discovery, reducing the time from years to months.

3. Quality Education (SDG 4):

AI-powered personalized learning platforms adapt to each student's pace and style. Tools like Duolingo and Khan Academy's Khanmigo provide customized tutoring. Artificial Intelligence also translates educational content into local languages, bridging the educational divide.

4. Smart Cities and Sustainable Infrastructure (SDG 11):

Over 55% of the world's population lives in cities. AI optimizes traffic flow, reducing congestion and emissions. Pittsburgh's Surtrac system reduced travel time by 25% using Artificial Intelligence traffic lights. AI also manages water distribution, detects leakages, and optimizes public transport and waste collection routes.

IV. AI for Economic Sustainability (Prosperity)

1.Responsible Industry and Innovation (SDG 9):

AI optimizes manufacturing through predictive maintenance, reducing downtime and material waste. Digital twins – virtual replicas of factories – allow simulation to improve energy efficiency before actual implementation.

2.Decent Work and Economic Growth:

While there is fear of job loss, Artificial Intelligence can augment human work and create new green jobs like AI sustainability analysts, data ethicists, and renewable energy managers. AI tools also help small businesses access microfinance through alternative credit scoring based on non-traditional data.

V. Challenges and Ethical Considerations: Despite its potential, Artificial Intelligence for sustainability faces significant challenges:

a) Energy Footprint of AI: Training large AI models consumes huge energy. Training one large language model can emit as much CO2 as five cars in their lifetime. We need Green AI – developing energy-efficient algorithms.

b) Digital Divide: 2.6 billion people still lack internet access. If AI benefits are concentrated in developed countries, it will widen inequality.

c) Data Bias and Ethics: Biased data can lead to unjust decisions in loan allocation, healthcare, or disaster relief. Transparency, fairness, and accountability must be built into AI systems.

d) Governance: There is a lack of global standards for AI in sustainability. Strong policy frameworks are needed to ensure AI is used for public good.

Pros of using Artificial Intelligence

- Streamlines and automates repetitive tasks
- Saves time
- Saves humans from doing dangerous jobs
- Allows for new technological discoveries
- Lowers possibility of human error

Cons of using Artificial Intelligence

- Very expensive to execute.
- Potential loss of non-hazardous human jobs.
- Huge environmental cost to maintain.
- Can be used to plagiarize art and other online content
- Security risks from hackers.

VI. Water Resource Management

Water scarcity affects 40% of the global population. AI plays a vital role in sustainable water management. Machine learning algorithms analyze rainfall patterns, groundwater levels, and consumption data to predict droughts and optimize water allocation. In India, the Jal Shakti Abhiyan uses AI-based sensors to monitor groundwater depletion in Punjab and Rajasthan. Companies like Aquasuite use AI to manage wastewater treatment plants, reducing energy use by 25%. AI-powered leak detection systems in pipelines, like those used by London's Thames Water, can detect leaks within 2 meters accuracy, saving millions of liters daily.

VII. Disaster Risk Reduction and Early Warning Systems (SDG 13)

to secure transactions. AI chatbots also educate consumers about carbon footprints of products, encouraging eco-friendly choices.

VIII. Detailed Case Study: India and Artificial Intelligence for Sustainability

India, with its large population and vulnerability to climate change, provides a unique case. NITI Aayog's National Strategy for AI (2018) identifies agriculture, health, and environment as key focus areas.

- Agriculture: The AI Agri project in Maharashtra predicts cotton pest attacks using satellite images, helping 10,000 farmers reduce pesticide use by 35%.
- Air Quality: AirDelhi project uses AI and low-cost sensors to create hyperlocal pollution maps, helping government close polluting units.
- Energy: Tata Power uses AI to integrate 500 MW of solar power into Mumbai's grid without blackouts

IX. Policy Framework and Recommendations

To fully harness AI for SDGs, the following 5-point framework is recommended

1**.Open Data Ecosystem**: Governments should create open, anonymized datasets for climate, agriculture, and health. The EU's Copernicus satellite data is a good example.

2**.Green AI Standards**: Mandate carbon reporting for AI models and incentivize efficient algorithms. Research into neuromorphic computing and edge AI can cut energy by 80%.

3.Capacity Building: Integrate AI and sustainability into school curricula. UNESCO's AI literacy program aims to train 10 million teachers by 2027.

4.Public-Private Partnership: Create innovation hubs like India's AI for Social Good labs where startups work with NGOs.

5.Ethical Auditing: Every AI system deployed for SDGs must undergo bias, fairness, and environmental impact audits before rollout.

This extended analysis shows that AI is not just a technology, but a socio-technical system that must be aligned with human values and planetary boundaries.

Importance of Artificial Intelligence in Sustainable Development:

Artificial Intelligence (AI) has emerged as one of the most powerful tools for achieving sustainable development. Sustainable development means meeting present needs without compromising the ability of future generations to meet their own needs. It stands on three pillars: environmental protection, social equity, and economic prosperity. The United Nations' 17 Sustainable Development Goals (SDGs) aim to achieve this by 2030, but the world is currently off-track. AI provides the data processing power, predictive capability, and optimization needed to accelerate this progress.

1. Environmental Importance:

The greatest importance of AI is in protecting the planet. Climate change is the biggest threat to sustainability. AI models analyze huge amounts of satellite, ocean, and atmospheric data to predict extreme weather, floods, and cyclones 7-10 days in advance. Google's Flood Hub and GraphCast are saving millions of lives. AI also tracks greenhouse gas emissions from 352 million sources globally through projects like Climate TRACE, ensuring transparency in climate action.In energy, AI is crucial for the transition to renewable energy. Since solar and wind are intermittent, AI forecasts their generation 36 hours ahead, helping to balance the grid. DeepMind reduced Google's data center cooling energy by 40% using AI. Smart grids powered by AI reduce wastage and integrate electric vehicles efficiently.For biodiversity, AI automates monitoring. Systems like Wildlife Insights identify animal species from camera trap images with 97% accuracy, helping protect endangered species. AI drones detect illegal deforestation and poaching in real-time in the Amazon and African forests. In waste management, AI robots like AMP Robotics sort waste at 80 items per minute with 99% purity, promoting a circular economy.

2. Social Importance:

AI is vital for social sustainability, especially in food, health, and education. In agriculture, which uses 70% of fresh water, AI enables precision agriculture. It provides farmers with exact information on when to irrigate, fertilize, and spray, reducing water use by 30% and chemical use by 90%. In India, AI apps have increased yields by 30% for small farmers.In healthcare (SDG 3), AI improves access and quality. AI can detect tuberculosis, diabetic retinopathy, and cancer from scans in seconds with doctor-level accuracy. This is critical for rural areas where doctors are scarce. AI also accelerated drug discovery during COVID-19 and predicts disease outbreaks before they spread.In education (SDG 4), AI personalizes learning

for each student through platforms like Khan Academy and DIKSHA, which translates content into 20 Indian languages. AI also makes cities sustainable by optimizing traffic, which reduces travel time by 25% and emissions by 20%, and by detecting water leaks, saving millions of liters daily.

3. ECONOMIC IMPORTANCE:

Economically, AI promotes sustainable industry and responsible consumption. Predictive maintenance in factories reduces downtime by 30% and material waste. AI optimizes supply chains and delivery routes, cutting fuel consumption by 15-20%. It also promotes financial inclusion by providing alternative credit scoring for 300 million unbanked people, allowing small farmers and women entrepreneurs to get loans. In conclusion, AI is important because it turns data into action. It makes sustainability measurable, predictable, and optimizable. However, its own energy footprint and the digital divide must be managed through Green AI and inclusive policies. If used responsibly, AI can help achieve 134 out of 169 SDG targets, making it an indispensable catalyst for a greener, fairer, and more resilient future.

AI empowers 10 million small farmers with advisories in Kannada and other local languages on low-cost smartphones. For sustainable development to be truly inclusive, AI must reach the last mile. This requires open data, Green AI standards, and AI literacy for youth. Ultimately, AI is not replacing humans but augmenting human capability to protect the planet and ensure prosperity for all.

X. Conclusion:

Artificial Intelligence is a critical catalyst for achieving the Sustainable Development Goals. From predicting climate disasters to increasing crop yields and making cities smarter, its applications are vast and impactful. However, AI is a double-edged sword. Its own sustainability and ethical deployment must be ensured. The future lies in Responsible AI – AI that is inclusive, low-carbon, transparent, and human-centric. Governments, academia, industry, and civil society must collaborate to create open datasets, invest in green computing, and provide AI literacy to all. If governed wisely, AI can help us build a world that is not only more intelligent but also more sustainable, equitable, and resilient for future generations.

ARTIFICIAL INTELLIGENCE–ENABLED TEACHING AND STUDENT LEARNING OUTCOMES: A META-ANALYTIC EVIDENCE SYNTHESIS FOR SHAPING SMART TEACHERS

Dr. Kalyani K.
Guest Faculty, Department of Education, Bangalore University, Bengaluru, Karnataka, India

Abstract

Artificial intelligence (AI) is rapidly reshaping teaching, learning, assessment, and educational decision-making. This paper presents a focused meta-analytic evidence synthesis of published meta-analyses examining AI, generative artificial intelligence (GenAI), and ChatGPT-supported learning. The synthesis indicates consistently positive, though heterogeneous, effects across educational contexts. A 2025 meta-analysis of AI and academic achievement reported an overall effect size of 0.924, while a 2025 meta-analysis of GenAI and university learning reported an overall effect of g = 0.804. A 2026 meta-analysis of ChatGPT reported g = 0.670, and a three-level meta-analysis of GenAI in higher education reported a medium overall effect of g = 0.499. The latter study found stronger effects for understanding, cognitive and creative outcomes (g = 0.669) and higher-order learning (g = 0.504), with teaching method emerging as an important moderator. Collaborative learning (g = 1.026) and blended learning (g = 0.633) showed particularly strong effects. These findings suggest that AI is not educationally effective merely because it is technologically sophisticated; its value depends substantially on pedagogical design, teacher guidance, critical evaluation, and responsible assessment. Based on the synthesized evidence, the paper proposes a Smart Teacher Competence Framework comprising AI literacy, pedagogical integration, critical evaluation, ethical AI competence, assessment literacy, and reflective professional development. The paper argues that the future of AI in education should be conceptualized not as teacher replacement but as the strengthening of human professional judgment through informed and ethical use of AI.

Keywords: *Artificial intelligence, generative AI, smart teachers, learning outcomes, meta-analysis, teacher education*

1. Introduction

Artificial intelligence has become an important force in contemporary education. Intelligent tutoring systems, adaptive learning platforms, automated feedback, learning analytics, conversational agents, and generative AI are increasingly used to support teaching and learning. The rapid expansion of tools such as ChatGPT has intensified debate about the changing role of teachers and the competencies required for future classrooms.

Individual empirical studies often report different results because AI interventions vary in educational level, discipline, duration, technology, pedagogy, sample characteristics, and outcome measures. Meta-analysis is therefore valuable because it synthesizes evidence across studies and provides a broader estimate of effectiveness. Recent meta-analyses generally report positive effects of AI and GenAI on student learning, although substantial heterogeneity cautions against assuming that all AI applications are equally effective.

The present paper does not claim to conduct a new primary meta-analysis. Instead, it synthesizes published meta-analytic evidence and interprets its implications for teacher

education. This approach is particularly relevant to the theme of shaping smart teachers, because technology alone does not determine educational quality; teachers determine how technologies are pedagogically selected, critically evaluated, ethically governed, and meaningfully integrated.

2. Objectives of the Study

- To synthesize recent published meta-analytic evidence on AI, GenAI, and student learning outcomes.
- To examine major patterns and contextual factors associated with AI-supported learning.
- To identify the implications of meta-analytic evidence for the changing role of teachers.
- To propose a Smart Teacher Competence Framework for AI-enabled education.
- To discuss implications for teacher education and professional development

3. Methodological Approach

This study adopts a meta-analytic evidence synthesis approach based on selected published systematic reviews and meta-analyses examining the educational effects of Artificial Intelligence (AI), Generative AI (GenAI), and ChatGPT on student learning outcomes. Relevant published meta-analytic studies reporting quantitative evidence on academic achievement, cognitive and higher-order learning, and related educational outcomes were comparatively examined. The present study does not independently collect or statistically analyse the primary studies included in these published meta-analyses; therefore, the reported numbers of studies and effect sizes are presented as findings from the original reviews and are not newly calculated estimates. As the reviewed meta-analyses differ in participants, educational contexts, AI technologies, interventions, and outcome measures, their findings are narratively and graphically synthesized rather than statistically combined. The synthesized evidence is interpreted to examine its implications for shaping smart teachers, leading to the proposed Smart Teacher Competence Framework comprising AI literacy, pedagogical integration, critical evaluation, ethical AI competence, assessment literacy, and reflective professional development.

4. Meta-Analytic Evidence on AI and Learning

4.1 Overall evidence

A 2025 meta-analysis examining AI and students' academic achievement included 29 empirical studies involving 2,657 participants and reported a significant overall effect size of 0.924. The study also reported substantial heterogeneity, indicating considerable variation among interventions and contexts. A separate 2025 meta-analysis of GenAI and university students' learning outcomes synthesized 57 studies and 97 estimates and reported an overall effect of $g = 0.804$. A 2026 meta-analysis of 35 experimental studies involving ChatGPT reported an overall effect of $g = 0.670$. In addition, a three-level meta-analysis of 36 empirical studies and 132 effect sizes reported a medium overall effect of GenAI on higher-education learning outcomes ($g = 0.499$).

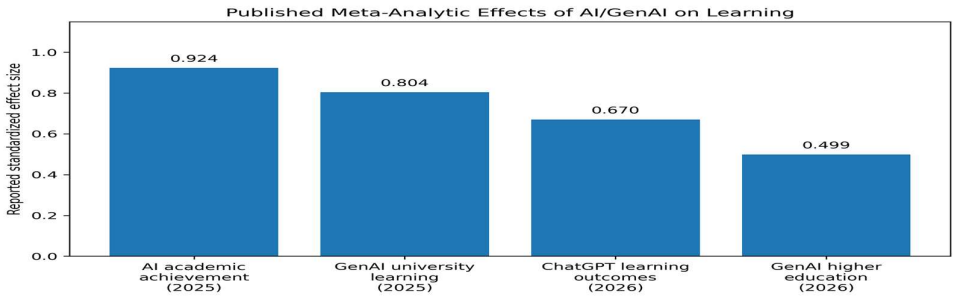

Figure 1. Published meta-analytic effect sizes of AI/GenAI on learning outcomes.

Figure 1 shows that the published meta-analyses consistently report positive average effects. However, the numerical values should not be ranked as if they represent identical interventions. Each review differs in population, educational context, AI technology, inclusion criteria, and outcome measurement. The strongest conclusion is therefore one of convergence: current quantitative syntheses generally support the educational potential of AI and GenAI, while simultaneously demonstrating the importance of context.

4.2 Effects across learning outcomes

The three-level meta-analysis of GenAI in higher education provides a more differentiated picture. The strongest significant effects were reported for understanding, cognitive and creative outcomes (g = 0.669), followed by higher-order learning (g = 0.504), dispositions (g = 0.452), and attainments (g = 0.363). Evidence for some other outcome categories was insufficient because too few effect sizes were available. These findings suggest that GenAI may contribute to learning in several domains, but the magnitude of benefit differs according to what is measured.

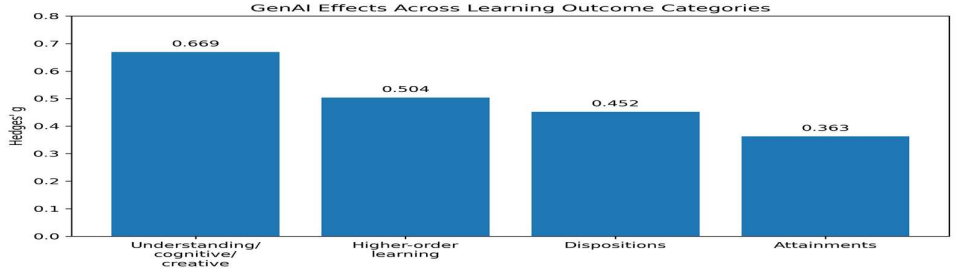

Figure 2. GenAI effects across learning outcome categories.

This pattern has direct implications for teachers. AI-supported activities should not be judged only by whether students produce better final answers. Educational designs should examine understanding, reasoning, creativity, motivation, higher-order thinking, and the capacity to evaluate information. Assessment systems that measure only finished products may fail to distinguish genuine learning from AI-assisted output.

4.3 Pedagogy as a critical moderator

One of the most important findings for teacher education concerns pedagogy. In the three-level meta-analysis, teaching method was the only significant moderator among the examined study-level moderators. Collaborative learning produced the strongest reported effect (g = 1.026), followed by blended learning (g = 0.633). Other reported approaches showed lower effects in the same analysis.

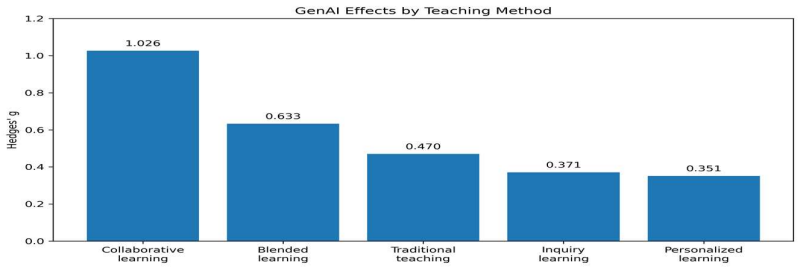

Figure 3. Reported GenAI effects by teaching method.

The implication is clear: AI should not simply be provided to students as an answer-producing system. Teachers can design collaborative tasks in which students compare AI outputs, verify claims, identify bias or inaccuracies, justify decisions, generate alternative explanations, and reflect on their learning. Such pedagogical orchestration can transform AI from a passive shortcut into a resource for inquiry and intellectual engagement.

5. Implications for Shaping Smart Teachers

The synthesized evidence indicates that teachers remain central to educational quality in AI-enabled environments. A smart teacher is not merely a teacher who can operate digital tools. Rather, a smart teacher combines technological understanding with pedagogical judgment, ethical responsibility, assessment competence, and reflective practice.

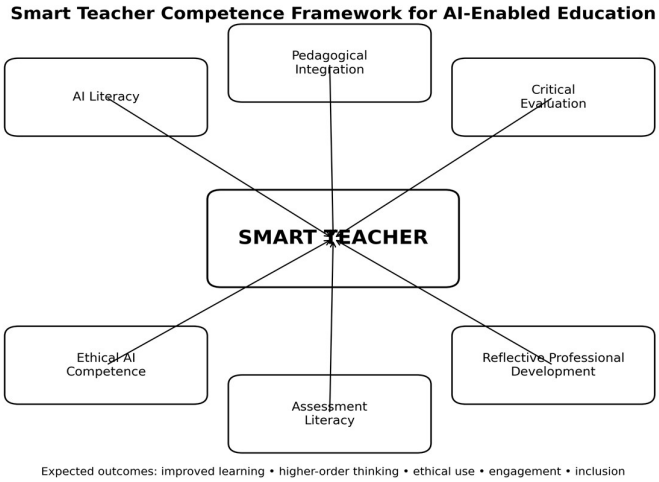

Figure 4. Proposed Smart Teacher Competence Framework for AI-enabled education.

AI Literacy: Teachers need a practical understanding of AI capabilities and limitations, including hallucinations, bias, privacy concerns, and unreliable outputs.

Pedagogical Integration: AI tools should be selected according to learning objectives and embedded within meaningful instructional activities rather than used for technology's sake.

Critical Evaluation: Teachers and students must verify AI-generated information, compare it with credible academic sources, and exercise professional judgment.

Ethical AI Competence: Responsible practice requires attention to privacy, bias, transparency, academic integrity, inclusion, and equitable access.

Assessment Literacy: AI-enabled environments require more authentic and process-oriented assessment, including oral explanation, reflection, performance tasks, portfolios, and evidence of reasoning.

Reflective Professional Development: Because AI technologies evolve rapidly, teacher learning must be continuous and supported through experimentation, collaboration, and critical reflection.

6. Implications for Teacher Education

Teacher education institutions should move beyond isolated technical training. AI competence should be integrated across curriculum studies, pedagogy, assessment, educational psychology, research methodology, and professional ethics. Student-teachers should learn to use AI for lesson planning while simultaneously evaluating the quality of AI-generated materials. They should design AI-supported learning activities, recognize bias and misinformation, establish responsible-use expectations, and develop assessments that remain valid in the presence of generative AI.

Professional development should also emphasize pedagogical decision-making. The evidence summarized in this paper suggests that the effectiveness of AI depends substantially on how it is embedded within learning. Consequently, training that focuses only on prompts or software features is insufficient. Teachers require opportunities to redesign learning activities and assessment practices.

7. Challenges and Limitations

The positive evidence should be interpreted cautiously. Published meta-analyses report substantial heterogeneity, meaning that average effects conceal important differences across settings. Short interventions may not demonstrate sustained learning, and researcher-developed assessments may sometimes align closely with intervention activities. In addition, publication bias and the rapid evolution of AI technologies remain concerns. The evidence base is also developing quickly, and conclusions about particular tools may change as technologies and educational practices evolve.

A further limitation of the present paper is that it is a synthesis of published meta-analytic evidence rather than a de novo systematic review with independently calculated effect sizes. It should therefore be presented as a meta-analytic evidence synthesis. Future research could undertake a fully registered systematic review and meta-analysis using primary studies, PRISMA procedures, independent screening, standardized effect-size extraction, heterogeneity analysis, moderator analysis, and publication-bias assessment.

8. Conclusion

Current meta-analytic evidence provides substantial support for the educational potential of AI and GenAI. Positive average effects have been reported for academic achievement, cognitive and creative outcomes, higher-order learning, affective-motivational outcomes, and other dimensions of student learning. At the same time, heterogeneity and moderator findings demonstrate that AI does not produce educational improvement automatically.

The central conclusion is that AI becomes educationally valuable through sound pedagogy. Teachers remain responsible for selecting appropriate technologies, designing learning experiences, questioning AI-generated information, protecting ethical standards, and assessing genuine understanding. The proposed Smart Teacher Competence Framework therefore places human professional judgment at the centre of AI-enabled education.

The future of education should not be conceptualized as a competition between teachers and

artificial intelligence. A more productive vision is an intelligent partnership in which capable teachers use AI critically and creatively to strengthen learning, while retaining responsibility for pedagogy, ethics, inclusion, and professional judgment.

THE YOGIC UNDERSTANDING OF MIND, BEHAVIOR AND HUMAN POTENTIAL FOR STUDENT ENGAGEMENT

Dr. Bhgyajyothi Meti,
Teaching Assistant, Karnatak University College of Education, Karnatak University, Dharwad, Email: bhagyaspatil9@gmail.com

Abstract

Rising rates of psychological distress, addiction, and suicidal behavior among young people in India have made the search for sustainable, low cost, and culturally rooted interventions urgent. The yogic tradition offers a detailed model of mind, its fluctuations and the layered structure of human personality, along with practical disciplines for regulating attention, emotion, and behavior. This article examines the yogic understanding of mind and behavior and connects it to the everyday pressures facing Indian youth today, including stress, behavioral change, poor food habits, impatience, addiction to gaming and mobile devices, concentration difficulties, and lifestyle linked conditions such as diabetes and heart disease. It closes with practical suggestions for good health protection and a note on seeking professional support for anyone personally affected by these issues.

Keywords: *Yogic Psychology, Youth Mental Health, Stress, Addiction, Lifestyle Disorders.*

Introduction:

Young people in India today face a distinct combination of stressors. Board examinations, entrance tests for engineering and medical colleges, family expectations around career and marriage, and constant social comparison on Instagram and WhatsApp all add to daily pressure. Mental health surveys across the country have repeatedly linked these pressures to rising anxiety, depression, self-harm ideation, and substance dependence among adolescents and young adults. These are not purely biomedical problems. (Bhide et al., 2023) They are also problems of meaning, self-regulation, and disconnection from a stable sense of identity, which is precisely the terrain the yogic tradition has mapped for centuries. Alongside psychological strain, physical health is also being reshaped by these same behavioral patterns. Irregular eating, disturbed sleep, and long hours of sedentary screen use are now appearing earlier in life among Indian youth, contributing to conditions once associated mainly with middle age.

Yogic philosophy describes the human being as composed of progressively subtler layers, moving from the physical body to the mind, vital energy, intellect, and an innermost layer of bliss. Gaining mastery over the intellect is said to bring a corresponding degree of control over energy, thought patterns, behavior, and overall quality of life. Behavioral change works best when it addresses more than just outward symptoms. In classical yoga psychology, chitta refers to the whole field of consciousness, including what modern psychology terms the unconscious, a repository of latent impressions called samskaras that quietly shape emotion, thought, and behavior even when a person is not directly aware of them. Vrittis are the fluctuations or whirlpools that arise in this field, and yoga is classically defined as the

discipline of stilling these fluctuations. Emotional turbulence, compulsive behavior, and addictive patterns can be understood, in this framework, as vrittis that have become habitual and self-reinforcing. (Anderson et al.; Neuroscience of Consciousness, 2021)

A central yogic insight is that conscious experience is observed by a deeper witness self, distinct from the passing states of the mind and body. Cultivating this witnessing awareness, the ability to notice a craving, an urge, or a painful emotion without being completely absorbed by it, is one of the tradition's most practically useful contributions to behavioral self-regulation. It maps closely onto contemporary mindfulness based approaches used in addiction and relapse prevention programmes. The following sections apply this understanding to the major problems facing Indian youth today, and close with practical suggestions for good health protection. (Patel, Yogic Psychology and the Mind)

Major Problems Facing Youths at present Situations:

1. Stress:

Stress is the most common complaint among Indian youth today, arising from board examination pressure, competitive entrance tests such as JEE and NEET, family expectations, and constant comparison with peers on social media. In the yogic framework, stress is essentially chitta vikshepa, a scattered and agitated state of mind in which attention is pulled in many directions at once, leaving no reserve of calm to draw on. (Kumar and Bharadwaj, 2016)

- A student preparing for the JEE or NEET examination while also checking social media notifications through the day often reports racing thoughts, disturbed sleep, and irritability, which reflects the classic pattern of scattered attention that yoga calls vikshepa.
- Constant comparison with the curated lives of friends and classmates on Instagram generates a steady, low grade stress even when nothing has actually gone wrong in a young person's own life, showing how a mental habit of comparison can create real physical strain.
- A regular practice of slow breathing, a few minutes of quiet sitting between study sessions, and dividing study time into fixed blocks can prevent attention from fragmenting across too many demands at once.

2. Behavioural Change:

Many young people in India show a noticeable shift in behavior, becoming irritable, withdrawn from family, suddenly aggressive, or visibly less motivated, often before they are able to explain what they are actually feeling. Yogic psychology attributes such shifts to accumulating unprocessed impressions that eventually surface as changed conduct, even when the underlying cause is not consciously understood by the person experiencing it. (International Journal of Innovations and Research Analysis, 114)

- A student who was previously outgoing may become withdrawn and short tempered after repeatedly failing to meet the marks expected by parents and teachers, and this change in behavior is often an expression of accumulated frustration and shame rather than simple bad attitude.

- Sudden anger over a small matter, such as losing an online match or being scolded for spending too long on the phone, often reflects a mind that was already carrying unexpressed stress, with the small incident acting only as the final trigger.
- Keeping a regular habit of writing down one's feelings, or talking openly with a trusted family member, teacher, or counsellor, helps release accumulated emotion before it builds into a larger behavioral change.

3. Food Habits:

Irregular meals, heavy reliance on packaged snacks and sugary cold drinks, and eating in front of a phone or television screen have become common among Indian youth, particularly in cities. Yoga treats food as directly shaping the quality of mind, holding that what is eaten, and the state of mind in which it is eaten, both influence mental clarity and emotional steadiness and not only physical health. (Patel, Yogic Psychology and the Mind)

- Skipping breakfast and depending on tea, coffee, or energy drinks to get through long study hours produces a short burst of alertness followed by a crash in concentration and mood later in the day.
- Eating dinner late at night while watching a web series or scrolling through reels, without paying attention to the meal itself, is linked among many students to poor digestion and disturbed sleep, illustrating the yogic idea that eating without awareness disturbs both body and mind.
- Keeping regular meal timings, choosing fresh home cooked food such as dal, rice, and vegetables over packaged snacks, and eating without a screen in front of oneself restores basic attentiveness to the body's own signals of hunger and fullness.

4. Lack of Patience:

A reduced tolerance for delay, wanting instant results, instant replies on WhatsApp, and instant entertainment on reels, is widely reported among youth who have grown up with constant digital stimulation. Yogic thought links this pattern to a mind trained by rapid stimulation, which gradually loses its capacity for sustained and calm effort, known in the tradition as dhriti or steadiness. (International Journal of Research, Vol. 9, Issue 3)

- A student who gives up on a difficult mathematics problem within a few minutes because the solution is not immediately visible, instead of persisting through trial and error, shows a reduced tolerance for the kind of productive struggle that learning requires.
- Frustration or restlessness when a video takes a few seconds to load, or when a friend does not reply to a WhatsApp message within minutes, reflects a mind that has been conditioned to expect immediate resolution to every small discomfort.
- Deliberately taking up an activity that requires sustained effort over time, such as learning a musical instrument, playing a sport, or reading a full book instead of short posts, helps rebuild the mind's tolerance for gradual progress.

5. Addiction and Bad Habits, Including Gaming and Mobile Phone Use:

Gaming applications such as PUBG and Free Fire, along with general smartphone overuse, have become among the most visible behavioral concerns for Indian youth today, alongside the older concern of substance use. In yogic terms, these patterns are vrittis that

have turned into self-reinforcing loops, where a craving arises, is immediately satisfied by a quick reward such as a game win or a new notification, and the loop grows stronger with every repetition, gradually weakening a young person's ability to resist it. (Neuroscience of Consciousness, Oxford Academic, 2021)

- A young person who intends to play a mobile game for only ten minutes before returning to studies often loses several hours instead, because the game is designed around exactly the kind of reinforcing reward pattern that yogic psychology describes as a strengthening vritti.
- Reaching for the phone immediately upon waking, before any conscious decision has been made to check it, shows how a habitual pattern can operate almost independently of a person's actual intention.
- Turning to smoking, vaping, or alcohol to manage social anxiety or boredom during college years follows the same reinforcing pattern of short term relief followed by a stronger craving the next time discomfort arises.
- Setting fixed phone free periods, using the yogic practice of pratyahara or deliberate withdrawal of the senses from a stimulus, and replacing the urge to check the phone with a brief breathing exercise, helps interrupt the loop before it strengthens further.

6. Concentration Problems:

Difficulty sustaining focus on a single task, whether studying, reading, or even a conversation, is frequently reported by young people who divide their attention across multiple screens and notifications throughout the day. Yoga treats one pointed attention, known as ekagrata, as a trainable ability rather than a fixed trait, developed through practices such as trataka, or focused gazing, and dharana, concentration on a single object. (Sharma, Sahare and Shrivastav, 2013)

- A student who reads the same paragraph of a textbook several times without absorbing its meaning, while a phone lies nearby buzzing with notifications, is experiencing attention fragmented across competing stimuli rather than any lack of intelligence or effort.
- Struggling to follow a full conversation with a friend or family member without glancing at a phone shows how this same fragmentation has moved from study time into everyday social life.
- A short daily practice of five to ten minutes of trataka or focused breath counting, along with physically removing the phone from the study space rather than merely silencing it, gradually rebuilds the span of attention.

7. Lifestyle Change During the Transition from School to College:

The move from school to college in India brings hormonal, social, and identity changes that reshape daily routines, sleep patterns, and self-image. Yogic tradition has historically paid close attention to different stages of life, recognizing that habits and expectations should match a person's current stage of development rather than being applied the same way throughout life. (International Journal of Research, Vol. 9, Issue 3)

- Sleep timing naturally shifts later during the teenage years, and when this is combined with early college lectures and late night use of phones, many students accumulate a chronic lack of sleep during exactly the years their body and mind are still developing.
- Moving away from home for college, or simply gaining greater independence after school, often removes the structure that parents previously provided, and without a new self-imposed routine this can quickly lead to irregular sleep, meals, and physical activity.
- Treating this period of life consciously as a stage that calls for new self-discipline, known in the yogic tradition as svadhyaya or self-study, and deliberately building a personal daily routine, helps prevent the drift into unhealthy habits that often begins at this age.

8.Diabetes Among Young People:

Type 2 diabetes, once considered a condition of middle age, is increasingly being diagnosed among younger people in India, a country already carrying one of the highest burdens of diabetes in the world. This trend is driven substantially by the same behavioral patterns described above, including irregular and sugar heavy food habits, long hours of sedentary screen time, and disturbed sleep, all of which affect the body's sensitivity to insulin over time. (Bhide et al., 2023)

- A young person who spends most of the time outside class seated in front of a screen, combined with frequent snacking on sweets, fried food, and sugary drinks, is accumulating exactly the risk factors of inactivity and excess sugar intake that are associated with early insulin resistance.
- Chronic, unmanaged stress raises the level of cortisol in the body, which can further disturb blood sugar regulation, showing how the mental and physical risk factors discussed in this article compound one another rather than acting separately.
- Regular physical movement such as yoga asana practice, walking, or any consistent sport, together with attention to meal regularity and stress reduction through breathing practices, addresses the underlying behavioral causes rather than only the eventual physical outcome.
- This information is general in nature. Diagnosis and management of diabetes require evaluation by a qualified medical professional.

9.Heart Attack and Cardiovascular Risk Among Younger Adults:

Cardiovascular events, once considered rare before middle age, are now being reported with growing frequency among younger adults in India, a trend widely linked to a combination of stress, poor sleep, sedentary habits, tobacco or substance use, and diets high in processed and fried food. These are the very behaviors described throughout this article. (Bhide et al., 2023; Anderson et al.)

- A young working professional putting in long, high pressure hours with little physical activity, poor sleep, and heavy reliance on tea, coffee, and packaged food is accumulating several cardiovascular risk factors at the same time, even without any single dramatic cause.

- Chronic stress that continues unmanaged over several years is increasingly recognized as a contributor to cardiovascular strain, reinforcing that mental and physical health cannot be treated as separate concerns.
- Regular moderate physical activity, breathing practices that support balance in the body's nervous system, sufficient sleep, and moderation in diet, combined with routine medical checkups rather than relying on lifestyle measures alone once risk factors are already present, form the most reliable protection.
- This information is general in nature and not a diagnostic or treatment guide. Any chest pain, breathlessness, or related symptoms require urgent medical evaluation and not self-management.

Suggestions for Good Health Protection in Youths:

The following measures combine yogic practice with contemporary evidence on youth mental and physical health. They are intended as complementary, preventive, and supportive measures and not as a substitute for clinical care where that is needed.

1.For the Individual:

- A short, consistent daily practice of breath awareness and quiet sitting builds a baseline of calm before stress has the chance to accumulate.
- Pausing to silently name an urge or emotion, such as recognizing it as anxiety or as a craving, rather than acting on it immediately, is a simple and direct way of applying witness consciousness in daily life. (Neuroscience of Consciousness, Oxford Academic, 2021)
- Deliberately structuring screen time, sleep, and diet supports mental steadiness, since yogic practice treats discipline over the senses as foundational to a stable mind.
- Fixed phone free periods, such as during meals, the first hour after waking, and the hour before sleep, interrupt reinforcing addictive habits before they strengthen further.
- Daily physical activity, whether yoga asana, walking, or a sport, supports both mental steadiness and long term protection against diabetes and cardiovascular risk.
- Consistent meal timing and home cooked, minimally processed food eaten without a screen supports both physical and mental health.
- A short daily concentration practice of five to ten minutes gradually rebuilds attention span.
- Keeping a regular habit of journaling or quiet self-reflection helps release the day's reactive moments before they accumulate into larger patterns.
- Protecting a consistent sleep and wake schedule is especially important during the transition from school to college described earlier in this article.

2.For Families and Educators:

- Modelling calm emotional responses and healthy screen habits teaches young people more effectively than rules alone, since they absorb behavior from the adults around them.
- Introducing simple breathing or mindfulness practices in schools as a normal, everyday habit, rather than only in response to a crisis, builds resilience before problems arise.
- Regular, low pressure conversations between parents or teachers and young people help early signs of distress or behavioral change to be noticed before they escalate.

- Supporting balanced, home cooked food and shared family mealtimes, where possible, keeps food choices from being left entirely to convenience.
- Encouraging physical activity and hobbies that require sustained attention offers a healthy counterbalance to fragmented, screen based stimulation.

3.For Institutions and Counsellors:

- Combining yoga based counselling with standard psychological care, tailored to each individual's needs rather than applied as a single fixed routine, offers a more complete form of support. (Bhide et al., 2023)
- Training peer support groups and frontline staff to recognize early signs of withdrawal, hopelessness, or substance and device related misuse allows prompt referral to professional services.
- Offering routine health screening, including basic metabolic and cardiovascular checks, for young people with sedentary and high stress lifestyles allows risk to be identified before symptoms appear.
- Treating recovery and behavioral change as a gradual retraining of attention and habit, with sustained follow up rather than a single intervention, leads to more lasting improvement.

Conclusion: The yogic understanding of mind and behavior offers more than a historical curiosity. It provides a coherent, practice based framework for addressing the everyday pressures behind youth stress, behavioral change, poor food habits, impatience, addictive digital and substance habits, concentration difficulties, and lifestyle linked conditions such as diabetes and heart disease in India today. These difficulties can be traced to an overstimulated mind that is constantly pulled outward, to accumulated unprocessed impressions, and to habits built around short term reward rather than sustained wellbeing. Combined with contemporary medical care, counselling, and community support, these principles can inform practical, low cost, and culturally resonant strategies for protecting both the mental and physical health of young people. (Anderson et al.; Bhide et al., 2023; International Journal of Innovations and Research Analysis, 114)

AN ASSESSMENT OF GOVERNANCE AND IMPLEMENTATION MECHANISMS UNDER KARNATAKA STATE SKILL DEVELOPMENT POLICY 2025–2032

Kum. Kanakalakshmi V S,
Research Scholar, Department of Commerce, Maharajas College, University of Mysore, Mysore
Dr. Thimmarayappa R,
Professor, Department of Commerce, Maharajas College, University of Mysore

Abstract

The Karnataka State Skill Development Policy 2025-2032 serves as an extensive strategic blueprint intended to reshape the state's workforce development framework by reinforcing employability, preparing workers with skills relevant to future industries, and encouraging inclusive economic involvement that corresponds with Karnataka's changing industrial structure. This research undertakes a critical examination of the policy from a governance standpoint, assessing its strategic intentions, institutional setup, and execution methods against the backdrop of Karnataka's varied regional and socioeconomic conditions. Utilizing a qualitative policy analysis approach, the investigation references the policy text itself, academic writings on skill governance, government publications, and current discussions concerning employability, organizational collaboration, and regional inequities within Karnataka's skill infrastructure. The conceptual framework combines political economy analysis, institutional theory, and public administration concepts to offer a thorough analytical basis. The assessment indicates that although the policy exhibits considerable insight in tackling crucial matters such as preparedness for Industry 4.0, combining education with skill development, encouraging entrepreneurship, and advancing technological proficiency, it nonetheless confronts considerable governance and execution hurdles. Notable obstacles consist of insufficient institutional coordination systems, marked infrastructure gaps between Bengaluru and underdeveloped areas, inadequate decentralized governance frameworks, financial viability concerns, uneven institutional capabilities, and ongoing societal prejudice against vocational training. The research concludes that the lasting achievement of Karnataka's skill development system relies not exclusively on sustaining clear policy guidance but fundamentally on creating responsible, localized, and regionally-conscious governance structures that can successfully transform policy objectives into fair socioeconomic results throughout every district in the state.

Keywords: *Kaushal Karnataka, Skill India, Vocational Development, Skill Development, Governance Framework, Institutional Coordination*

I. Introduction

Karnataka is home to one of India's most advanced and varied skill development systems, supported by its strong industrial base, technological supremacy, and wide-ranging institutional network for workforce growth. The state accounts for over 8.4 percent of the national GDP, with per capita income considerably higher than the national average (PPMSD,

2024). The state's skill ecosystem gains additional strength from Bengaluru's position as India's Information Technology center, together with expanding influence in fields like aerospace and biotechnology, which are progressively moving toward Industry 4.0 and skill development driven by market demand. Throughout its history, the state has introduced multiple skill policies, with each new policy building on past experiences and addressing fresh challenges in the quickly transforming economic environment.

The Government of Karnataka previously approved a state skill development policy named "Kaushalya Karnataka - Kushala Karnataka," covering the period from 2017 to 2030. This policy aimed to establish a "Skilled and Prosperous Karnataka" by providing the state's workforce with employable abilities, thereby encouraging faster economic development. The policy was consistent with the wider national objectives of Skill India (SDEL, 2017). Its primary focus was on bringing together government, business, and community organizations, with the goal of training about 13.4 lakh individuals each year, thus reaching over 1.88 crore young people by 2030. Inclusivity was given considerable importance, with special emphasis on women, Scheduled Castes, Scheduled Tribes, and people with disabilities. Training in emerging technologies like artificial intelligence and environmentally friendly industries was targeted, with nine main sectors identified: Information Technology and IT-enabled Services, healthcare, education, construction, tourism, agriculture, logistics, textiles, and food processing (SDEL, 2017). In spite of these bold targets, putting the previous policy into practice encountered numerous difficulties, such as poor coordination among various government departments, budget limitations, and inconsistent regional coverage.

While the earlier policy was still in effect, the state government created the new Karnataka State Skill Development Policy 2025-2032, learning from the experiences and drawbacks of what came before. The policy notes that the state's skill ecosystem is being built through multiple organizations like the Karnataka Skill Development Corporation (KSDC), Industrial Training Institutes (ITIs), polytechnic colleges, higher education institutions, Sector Skill Councils (SSCs), business partners, and training providers situated in both city and countryside areas. The policy strives to combine skill development with formal education via apprenticeships, work placements, business startup support, and technology-based educational platforms that are consistent with the National Education Policy 2020. At the same time, the system works to resolve problems like the lack of employability among graduates, mismatches between skills and job requirements, uneven development across regions, and the scarcity of good-quality training options, especially in less developed areas such as Kalyana Karnataka. By intensifying its emphasis on artificial intelligence, digital technologies, cutting-edge manufacturing, and business creation, Karnataka's skill system intends to establish the state as an internationally competitive, innovation-focused, and inclusive workforce center, while also promoting sustainable socioeconomic progress in every region.

The importance of this research lies in its careful examination of the governance aspects of skill development policy, which are frequently neglected in favor of technical and program-related considerations. Although many studies have looked at the content and results of skill development initiatives, relatively few have systematically analyzed the institutional and administrative structures through which these policies are put into effect. This paper addresses

that gap by offering a thorough governance analysis of Karnataka's newest skill development policy, pinpointing both its strengths and weaknesses, and suggesting ways to strengthen the effectiveness of its implementation.

This paper intends to evaluate the Karnataka State Skill Development Policy 2025-2032 from a governance perspective by looking at its strategic direction, institutional frameworks, and implementation concerns. The research will also explore how the policy proposes to handle problems of regional inequalities, job readiness, institutional collaboration, and equitable development within the context of the state's rapidly shifting economic environment. The particular goals of this study are: (1) to examine the strategic vision and policy priorities of the Karnataka State Skill Development Policy 2025-2032; (2) to assess the institutional structure and coordination systems suggested in the policy; (3) to pinpoint the main governance and implementation difficulties confronting the policy; and (4) to offer suggestions for strengthening the governance of Karnataka's skill ecosystem.

II. Review of Literature

This part attempts to build the conceptual groundwork for policy measures in skill development by investigating the political economy perspective, the institutional perspective, and the management perspective. The literature review focuses on four connected themes that are crucial for examining the governance of skill development.

2.1 Political Economy Perspective

Political economy is an interdisciplinary social science field that examines the connections among people, governments, and public policy. The production, distribution, and exchange of goods and services in human society are the central concerns of political economy. Questions regarding how markets are understood, what relationship exists between markets and government, and how employer and employee organizations affect the production and exchange of goods and services are topics of political-economic investigation (Busemeyer & Trampusch, 2019). Every institutional approach emphasizes the links between Vocational Education and Training (VET), the job market, and labor relations. The labor markets in which countries function have strong connections to their VET systems. Moreover, direct government involvement, corporatist networks, local business networks, institutional organizations, and free markets represent the five main types of skill provision in vocational education and training (Crouch et al., 1999).

The political economy perspective is especially useful for comprehending skill development in the Indian setting, where the government has a significant role in influencing workforce development policies while at the same time handling complicated relationships with private enterprise and civil society groups. This perspective helps clarify how power dynamics among these interested parties affect the creation and execution of skill policies. In Karnataka, the political economy of skill development is formed by the state's distinctive industrial makeup, featuring a dominant IT sector existing alongside conventional manufacturing and farming sectors. This variety generates competing demands on the skill development system, necessitating careful balancing of interests among various stakeholder groups.

2.2 Institutional Perspective

Assessing skill policies from an institutional viewpoint is essential for grasping the roles of

stakeholders and the main networking difficulties from social and economic perspectives. The environments—such as networks, fields, and cultures—in which organizations are embedded have an effect on institutions (Greenwood, Oliver, & Roy, 2008). Institutions are independent forces for change that determine who is allowed to take part in political processes, with institutional orientation referring to the significance of institutions in shaping political actions and results (Mohamed, 2021). Institutions shape decisions and ideas about what is possible and desirable by establishing the pattern of methods that are applied.

The institutional perspective highlights political institutions and the political setting to account for decisions made by ruling political parties (Murray, 2015). This perspective is based on the idea that the outside institutional environment has a fundamental effect on party motivations and actions. Research indicates that institutional theory can be applied in entrepreneurship research to provide useful insights (Steinhauser, Rocha, & Paula, 2022).

Policy changes to skill formation systems are affected by economic, political, and social development pressures. Solga (2020) proposed that worldwide influences would result in the convergence of national skill formation systems. Three aspects of skill formation institutions—cultural-cognitive, normative, and regulative—are essential, and all three are necessary for long-term viability (Solga & Powell, 2010). The research suggested a structure that combines institutional strategies with comparative-historical analytical techniques to evaluate the importance of changes in skill formation within the European setting.

In Karnataka's situation, the institutional perspective helps explain why skill development initiatives succeed or fail depending on the strength and effectiveness of the organizations that carry them out. The state's skill ecosystem consists of numerous institutions at different levels—state-level agencies like KSDC, district-level administrations, and local training providers. The effectiveness of the overall system depends greatly on the coordination among these institutions and their capacity to adjust to changing conditions.

2.3 Management Theory

The basis for management theory was established by Taylor in “The Principles of Scientific Management,” with the goal of helping managers create and grow businesses, and this approach was subsequently modified for use in public administration (Taylor, 1911). Gulick (1938) offered a structure that brought scientific management to government, creating the abbreviation POSDCORB (Planning, Organising, Staffing, Directing, Coordinating, Reporting, Budgeting) to define seven key management duties (Wallace, 2013).

The Hawthorne studies introduced additional adjustments, indicating that management theory developed with Theory X and Theory Y. Theory X implied managerial oversight and control, while Theory Y encouraged the alignment of personal and organizational objectives to foster creativity. Group theory proposed that effective groups create shared objectives, values, behavioral standards, and traditions (Frederickson et al., 2012).

Role theory suggested that each position or office is logical and defined in its connections with others, the organization as a whole, and the organization's objectives. Communication Theory proposed that public management interacts with how effectively communication works, bringing together social psychology, linguistics, and cybernetics (Frederickson et al., 2012). Management theory also saw the development of New Public Administration and new public

management concerning public administration.

The Minnowbrook II conference resulted in the creation of New Public Management, with main objectives including ensuring service quality for citizens, giving public administration more independence, and being open to ideas from the business sector (Chakrabarty & Chand, 2016). The influence of NPM is apparent in skill policies across the world. In India, the National Policy on Skill Development and Entrepreneurship (2015) set benchmarks and performance measures through the National Skills Qualifications Framework, while the entire Skill India mission responds to market demands, providing control over results.

2.4 Placing Skill Development in Karnataka in Context

Karnataka's skill development framework represents an application of national policies, adapted to meet regional expectations. In 2016, the state moved from a fragmented approach under the Labour Ministry to a more unified approach with the creation of the Skill Development, Entrepreneurship and Livelihood (SDE&L) Department to enable better coordination among departments for enhanced service delivery (KSDA, 2022). The Karnataka Skill Development Authority has been given responsibility for maintaining training standards and overall quality, creating guidelines for trainer preparation, establishing standards for skill training, and raising the quality of skill programs. Additionally, the Karnataka Skill Development Corporation carries out policy execution by coordinating implementation across various sectors to address skill deficiencies (KSDC, 2016). International cooperation and the integration of advanced manufacturing can be observed in certain skill development centers dedicated to promoting global best practices and satisfying industry requirements (GTTC, 2024).

III. Research Methodology

A qualitative policy analysis method is used in this research to examine the Karnataka State Skill Development Policy 2025-2032 from a governance perspective. The descriptive and analytical work relies mainly on secondary sources, including the policy document being examined, government publications, and economic reports. Academic literature dealing with skill development, vocational training, and public management has also been reviewed.

The research employs thematic analysis to investigate important policy areas such as job readiness, industry integration, institutional coordination, regional fairness, and infrastructure development within Karnataka's skill ecosystem. The policy is examined using the Political Economy Perspective, Institutional Perspective, and Management Theory. These theoretical frameworks help clarify the role and interactions of the state, labor market, institutions, and governance structures in skill development.

The study additionally applies a critical governance perspective to point out weaknesses and challenges in the policy and its execution, especially concerning decentralization, regional disparities, institutional capacity, and workforce preparedness. Because the paper is based only on policy interpretation and governance analysis, no primary surveys or quantitative statistical analyses were undertaken.

IV. Policy Analysis of the Karnataka State Skill Development Policy 2025-2032

4.1 Vision and Strategic Direction

The Karnataka State Skill Development Policy 2025-2032 sets out an overall vision aimed at

creating a workforce that is ready for the future, employable, and entrepreneurial, capable of assisting Karnataka in reaching its long-term economic targets. The policy places strong emphasis on active industry participation, technological advancement, innovation-based skill development, and institutional collaboration. One of the policy's main strengths is its recognition that traditional vocational education systems cannot adequately respond to the quickly transforming industrial environment shaped by artificial intelligence, automation, digitization, and advanced manufacturing technologies. As a result, the policy gives priority to skill development programs in machine learning, robotics, renewable energy, cybersecurity, and healthcare technologies.

A notable feature of the policy is its focus on measurable and data-informed decision-making in governance. The suggested Skill Index represents an important move toward establishing district-level benchmarking and performance assessment. The Kalikeya Jothe Kaushalya program is another effort aimed at embedding employability skills in school education from an early stage. Although the policy attempts to elevate skill development beyond poverty reduction by connecting it with innovation and entrepreneurship, it lacks detailed operational information about implementation structures, institutional accountability, and coordination among departments.

4.2 Connecting Education and Skills

The policy acknowledges that a major cause of Karnataka's employability problem is the gap between the skills provided by the formal education system and those needed in the job market. The policy supports stronger integration of educational institutions with skill development channels through apprenticeships, internships, hands-on learning, and curriculum changes linked to industry needs. This integration effort is clearly shown in the Kalikeya Jothe Kaushalya program, which connects skill-based education with standard schooling. It also backs the National Education Policy 2020 by promoting multidisciplinary education, competency-based learning, and adaptable academic paths. However, implementation capacity varies greatly among institutions, with many colleges and training centers struggling to find qualified teachers and up-to-date laboratory facilities.

4.3 Focus on Entrepreneurship and Innovation

Entrepreneurship holds a central place in Karnataka's workforce strategy, especially given the state's status as a leading startup center in India. The policy encourages entrepreneurial activities by providing individuals with innovative skills and offering incubation and financial literacy support. Cooperation with startups, digital entrepreneurs, and incubation facilities shows how Karnataka's knowledge economy is opening new pathways for workforce development. Nevertheless, entrepreneurial ecosystems remain extremely unbalanced across Karnataka, with Bengaluru dominating access to venture networks and innovation funding. Smaller cities have comparatively weak business support systems, and many skill development programs concentrate mainly on short-term training outcomes without adequate attention to post-training business sustainability.

4.4 Inclusivity and Regional Development

The policy gives priority to inclusive workforce development and balanced regional growth. Economic growth in Karnataka has not been spread evenly across regions, and differences in

educational access, industrial concentration, infrastructure quality, and employment opportunities continue to affect workforce participation across districts. The policy targets these inequalities through district-level skill development strategies, digital learning initiatives, and economically responsive planning systems. However, regional implementation capacity remains extremely uneven, with industrial corridors like Bengaluru-Mysuru having more robust institutional ecosystems compared to rural districts.

4.5 Governance and Institutional Coordination

The governance structure of Karnataka's skill ecosystem involves numerous institutions forming an extensive network. The policy correctly recognizes that institutional coordination is crucial for reducing duplication and improving workforce outcomes. However, institutional fragmentation continues to hinder implementation efficiency. Multiple departments still manage parallel programs with different standards and monitoring systems. Although the policy calls for convergence, it lacks operational detail about decision-making authority, complaint resolution systems, and accountability mechanisms across institutions. The previous skill development policy also highlighted coordination problems but achieved only limited success.

4.6 Infrastructure and Capacity Issues

Infrastructure quality continues to be a major factor affecting the success of workforce development programs. Many ITIs, polytechnics, and training centers still deal with outdated equipment, inadequate laboratory facilities, and shortages of trainers. While the policy promotes digitally-based learning systems, technological readiness varies greatly across institutions. Training for future skills requires ongoing professional development for teachers and regular curriculum updates. Although collaboration with industry and technology providers is encouraged, success will depend on reliable financial support and continuous quality evaluation.

4.7 Financial Sustainability Issues

Karnataka's skill ecosystem faces major financial sustainability challenges. Training providers often experience administrative delays, rising operational costs, and uncertain funding. Smaller institutions without financial reserves are especially vulnerable. Funding mechanisms often continue to emphasize enrollment and certification numbers over long-term workforce results, creating incentives for numerical growth while possibly neglecting training quality. Financial governance therefore remains an area needing significant reform.

4.8 Social Perception and Aspirational Challenges

Vocational education continues to face serious perception problems, with traditional academic paths typically associated with social advancement. The policy suggests repositioning skill development by connecting it with future technologies and entrepreneurship. However, public perceptions are influenced not only by policy messaging but also by labor market outcomes and wage levels. If skill development pathways do not consistently provide stable employment and career advancement, behavioral attitudes may remain resistant to change despite policy initiatives.

4.9 Monitoring, Outcomes, and Accountability

The policy emphasizes measurable outcomes and evidence-based governance through the

Skill Index. However, the overall monitoring framework remains too dependent on quantitative administrative indicators like enrollment numbers and certification rates. Quality placement indicators and long-term socioeconomic outcomes are still not well integrated into evaluation systems. The absence of integrated labor market tracking systems prevents a comprehensive understanding of workforce changes. Stronger outcome-based evaluation systems will be needed to determine the true developmental impact.

V. Conclusion

The Karnataka State Skill Development Policy 2025-2032 marks a significant change in how the state approaches workforce development, employability improvement, and industrial competitiveness. The policy attempts to align skill development with the requirements of Industry 4.0, digital transformation, and entrepreneurship-driven growth through measures such as the Skill Index tool, Kaushalya Jothe Kaikeya, and district-level skill development initiatives. However, despite its strategic ambitions, the policy continues to face structural and administrative challenges that may limit its effectiveness in implementation.

From a theoretical standpoint, the policy is fundamentally based on political economy, institutional theory, and management-oriented public administration approaches. In political economy terms, the policy captures the strong connection between industrial growth, labor market needs, and government-led workforce planning. The emphasis on industry cooperation aligns with corporatist models of skill formation (Crouch et al., 1999). Institutionally, the policy's effectiveness will be shaped by differences in institutional environments across Karnataka, with Bengaluru having well-developed foundations while less developed districts face structural limitations. The policy's management orientation reflects New Public Management principles, with features like performance-driven execution and outcome-linked delivery methods. However, excessive focus on performance measures without considering regional differences may lead to procedural compliance systems that value statistical success over actual workforce transformation. Good governance requires combining efficient management practices with socially aware, regionally sensitive implementation mechanisms. The policy's success will ultimately be judged not by the number of people trained but by tangible improvements in employment outcomes and quality of life for Karnataka's workforce.

The long-term sustainability of the skill ecosystem cannot depend only on departmental coordination; it must involve all stakeholders, including local government bodies, community representatives, and industry associations. It requires strong decentralized governance structures, locally adaptable implementation mechanisms, long-term institutional investment, and balanced integration between economic productivity and social inclusion across all regions.

INDIAN KNOWLEDGE SYSTEM AND TECHNOLOGY IN TEACHER EDUCATION

Prasanna H A
Assistant Professor, Vidya Vikas B Ed College, Mysuru, E-mail: prasannaguyya@gmail.com

Abstract

The New Education Policy (NEP) 2020 has been launched to make over the Indian education system using holistic expansion of the learners. This structure provides an inclusive and integrated approach for the growth of the education system. The Indian Knowledge System (IKS) is one of the important aspects of the New Education Policy curriculum. Indian Knowledge System encompasses varied and prosperous inheritance knowledge of India that covers a range of domains such as science and technology, literature, philosophy, culture, medicine (ayurveda), and yoga. New Education Policy has focused on interdisciplinary knowledge, and it can incorporate the modern knowledge vested with Indian Knowledge System to address existing and future challenges. The Indian Knowledge System covers the knowledge possessions from the early to the current era. New Education Policy fosters the creation of language possessions and technology to make possible the Indian Knowledge System as it recognizes its significance for disseminating original knowledge. The role of technology in promoting the Indian Knowledge System (IKS) in teacher education is critical. And Technology facilitates the formation of language resources and tools that assist in the distribution of indigenous knowledge. It aids in the expansion of digital platforms and repositories where Indian Knowledge System can be methodically stored, accessed, and shared. Further in addition of Indian Knowledge System with New Education Policy will assist to appreciate the underlying current societal issues and to take out further research on these issues. Present paper focuses the bird eye on role of technology on Indian Knowledge System in different ways i.e. to understand the concept, research, evolve, preserve, promote and applying the IKS concepts through technology in Teacher Education.

Keywords: *Indian knowledge system, new education policy, contemporary knowledge, interdisciplinary knowledge and holistic development*

Introduction

The Indian knowledge system (IKS) will offer a transformative expedition into the depths of early Indian wisdom and its association to the National Education Policy (NEP) 2020. The National Education Policy (NEP) 2020 served as a guiding structure emphasizing holistic learning, suppleness, technology integration, teacher empowerment, and the recognition of native knowledge and cultural inheritance. These aspects cooperatively form the foundation for a transformative education system that prepares students for the complexities of the 21st century. India is a country with an antique civilization history and practices that are known to mankind. It is predictable to mount up some knowledge throughout its survival. This antique knowledge was potted on palm trees and transferred from generation to generation verbally. But over time there were unexpected changes in the knowledge alteration process and this native knowledge was lost. The newly introduced education system has attempted to offer this knowledge to people as demanded. Through present paper one can gain precious insights, discover key learning, and role of technology in promoting the Indian Knowledge System especially in Teacher Education in India.

Indian Knowledge System

The National Education Policy (NEP) 2020 in India also envisions an education system that draws from the country's well-off cultural and scientific inheritance. The NEP aims to generate a modern, Indian Knowledge based and advanced education system, and its impact on the education will be realized over time as a variety of initiatives are rolled out. Also, UGC recommends training in Indian Knowledge system and planned that the teachers will have to learn concerning educational references in the Vedas. Hence, Teacher education Curriculum envisaged Indian Knowledge System with reference to NEP 2020 is given below. And Indian Knowledge System (IKS) comprises three words namely: Indian, Knowledge, and System.

- **Indian**

It refers to Akhanda Bharata i.e. complete Indian subcontinent. It covers the area that spans from Burma on the east, modern-day Afghanistan on the west, the Himalayas on the north, and the Indian marine on the south. The antique Indian education included the teaching of eighteen Vidya Sthanas, or schools of learning, which were imparted in well-known centers such as Nalanda and Takshashila. India's worldwide reputation has been resultant from its contributions in the fields of Art, Architecture, Science, Technology, Craft, Engineering, Philosophy, and Practices. The majority of the foreigners those who were visited India for knowledge and dispersed this knowledge to the west and other parts of the globe. This is a part of Indian Knowledge System.

- **Knowledge**

Knowledge refers to the unspoken knowledge and it lies in the understanding of knowledge seekers. It is gained by insights into individual experiences, through observations, facing real-life problems, and solving them. Knowledge may live in literary and nonliterary forms. This unspoken knowledge is transferred systematically by way of proposing innovative theories, and frameworks, and in the form of fictional work i.e. in the form of open knowledge.

- **System**

System means a disciplined methodology and categorization scheme used to access a body of knowledge. The codification and categorization are based on the requirement, interest, and ability of the knowledge seeker so that he/she may access the intrinsic knowledge. This will help them increase insights from on the whole knowledge and know-how that dissimilar knowledge components rationally complement each other.

The Indian Knowledge System is the methodical transfer of antique and modern knowledge from one generation to another. It covers ancient knowledge from a range of domains to address current and future challenges. This knowledge exists in both fictional and non-literary works. And the mechanisms of Indian Knowledge system are in below diagram;

Role of Technology for Indian Knowledge System

- **Use of Technology for Understanding IKS**

a) Digitizing IKS Literature

- Scanning and Optical Character Recognition (OCR) to protectantique manuscripts
- Artificial Intelligence (AI) tools for translating and deciphering Sanskrit, Prakrit, and other antique scripts

b) Scientific Justification

- Lab-based experiments to check Indian Knowledge System principles (e.g., Ayurvedic medicines, metallurgical techniques)
- Facts analytics to correlate antique knowledge with modern scientific findings

c) Visualization and Simulations

- Virtual Realism (VR): Immersive experiences of antique monuments and practices.
- Simulations: Testing architectural designs from Vastu Shastra or engineering concepts in chronological texts.

d) Interactive Learning Platforms

- E-Learning modules and Massive Open Online Course's (MOOC) on topics like Yoga, Ayurveda, and Vedic Mathematics
- Mobile apps for easy to get to learning in local languages

e) Research Partnership

- Open repositories for mutual worldwide research on Indian Knowledge System
- Block chain for tracing document genuineness and intellectual property

f) Communal Media and Outreach

- Dumpy videos, info graphics, and podcasts to popularize Indian Knowledge System among adolescence
- Gamified apps to connect users in learning Indian Knowledge System principles

- **Use of Technology for Investigate on IKS**

a) Digitization and Admission

- ✓ High-resolution scanning and Optical Character Recognition (OCR) for antique manuscripts
- ✓ Digital records (e.g., National Manuscripts Mission) for global right to use to Indian Knowledge System texts

b) Artificial Intelligence (AI) and Machine Learning

- ✓ Decoding antique scripts like Brahmi and Grantha
- ✓ Analyzing historical texts to recognize patterns, interpolations, and context

c) Scientific Justification

- ✓ Laboratory investigate on Ayurvedic formulations and metallurgical techniques
- ✓ Simulation tools to test architectural principles and Vedic exorbitant models

d) Data Analytics

- ✓ Cross-referencing Indian Knowledge System concepts with current scientific findings
- ✓ Insights into chronological agricultural, medical, and environmental practices

e) Provenance block chain

- ✓ Ensuring genuineness of manuscripts and tracing their chronological origins

f) Two-way Research

- ✓ Cloud-based platforms for global collaboration on Indian Knowledge System studies
- ✓ Open – source repositories for distribution data and resources

g) Immersive Technologies

- ✓ Virtual Reality(VR) and Augmented Reality(AR) to recreate chronological environments and practices for empirical learning

h) Outreach and Distribution

- ✓ Publishing findings through e-books, online journals, and digital documentaries

Use of Technology to Evolve IKS

a) Modernizing Antique Practices

- Integrating Indian Knowledge System with contemporary scientific innovations (e.g., Ayurveda and biotechnology)
- Artificial Intelligence (AI) based enhancements in Vedic Mathematics for computational advancements

b) Digital Transformation

- Development of e-learning platforms and mobile apps for teaching Indian Knowledge System
- Use of Virtual Reality(VR) and Augmented Reality(AR) for immersive learning experiences, like exploring antique Indian architecture or rituals

c) Novel Applications of Indian Knowledge System

- Applying Indian Knowledge System principles in sustainable technologies (e.g., organic farming, waste management)
- Using conventional water conservation methods (step wells, tank irrigation) in current urban planning

d) Data-Driven Insights

- Big data analytics to revive and reinterpret Indian Knowledge System principles in modern contexts
- Computational models to replicate and adapt antique ecological and medical knowledge

e) Collaborative Novelty

- Open-source platforms for interdisciplinary investigate (e.g., combining Indian Knowledge System with Artificial Intelligence, robotics or renewable force)
- Blockchain for creating transparent systems to adapt and guard Indian Knowledge System knowledge

f) Globalization of Indian Knowledge System

- Distribution of Indian Knowledge System internationally through digital content like podcasts, videos and webinars
- Promoting Yoga, Ayurveda, and meditation practices as universal wellness solutions

Use of Technology to apply IKS

a) Sustainable farming and Water Management

- ❖ Technology: Internet of Things sensors and drones for precision farming

- ❖ Application: Implementing techniques from ***Vrikshayurveda and Krishi Parashara*** for organic farming and natural annoyance control

Example: Smart irrigation systems based on conventional tank and canal designs

b) Contemporary Healthcare Solutions

- ❖ Technology: Artificial Intelligence for diagnosing diseases and recommending Ayurvedic treatments
- ❖ Application: Modified healthcare combining ***Ayurveda*** with biomedical advances

Example: Apps providing herbal medicine suggestions based on ancient texts like ***Charaka Samhita.***

c) Sustainable Urban Planning

- ❖ Technology: Geographic Information System and reproduction tools for eco-friendly urban designs
- ❖ Application: Integrating ***Vastu Shastra*** principles for energy-efficient buildings

Example: Smart cities stimulated by antique urban layouts like ***Mohenjo-Daro***

d) Renewable Force and Environmental Conservation

- ❖ Technology: Planetary panels, wind force, and green technology
- ❖ Application: Leveraging ancient environmental practices for sustainable power use and resource management

Example: Bio-composting techniques from Indian Knowledge System to manage town waste

e) Education and Consciousness

- ❖ Technology: E-learning platform, Augmented reality (AR)/Virtual reality (VR) and gamification
- ❖ Application: Teaching ***Vedic Mathematics, Yoga*****,** and Sanskrit to contemporary learners

Example: Virtual reality(VR) experiences of antique monuments and rituals for cultural immersion

f) Cultural Conservation and Tourism

- ❖ Technology: Augmented reality (AR)/ Virtual reality (VR)and Artificial Intelligence-driven apps for tourism
- ❖ Application: Promoting inheritance sites and practices such as conventional crafts and performing arts

Example: Practical tours of historical sites like Nalanda and Hampi

g) Food and Nourishment

- ❖ Technology: Dietary analysis tools and databases
- ❖ Application: Promoting conventional Indian diets based on ***Ayurvedic principles***

Example: Artificial Intelligence powered apps recommending diets based on Dosha types

- **Use of Technology to Preserve IKS**

a) Digitization of Manuscripts

- o How: High-resolution scanning, optical character recognition (OCR), and digital records can preserve antique manuscripts

Example: Initiatives like the National Mission for Manuscripts (NMM) in India make use of technology to digitize and directory thousands of manuscripts

b) Make unclear Storage and Backups

- Ensures protected and long-term preservation of digital copies, preventing loss due to physical decompose

c) Artificial Intelligence for Language Deciphering

- Artificial Intelligence algorithms can assist decode and translate antique scripts like Brahmi, Devanagari, and Tamil-Brahmi into contemporary language

d) 3D Scanning

- Digitally preserving antique monuments, artifacts, and architectural marvels connected to Indian Knowledge System

Use of Technology to Promote IKS

a) Digital Platforms and Social Media

- Websites, You Tube channels, podcasts, and communal media platforms (Instagram, Facebook, Twitter)
- How: Sharing attractive content like tutorials on Vedic arithmetic, Yoga practices, or Ayurveda tips

Example: Platforms like "AYUSH" and "Yoga with Adrienne" popularizing antique wellness practices internationally

b) E-Learning and massive open online course's (MOOC)

- Online courses on platforms like SWAYAM
- How: Developing specialized courses on Ayurveda, Vastu Shastra, and Sanskrit language learning

Example: MOOCs offering lessons in Vedic Sciences or conventional Indian art forms

c) Virtual Reality(VR)and Augmented Reality (AR)

- Immersive technologies for interactive learning
- How: recreating antique monuments, rituals, and techniques for empirical education

Example: Virtual tours of Nalanda University or antique astronomical observatories like Jantar Mantar

d) Mobile Applications

- Apps focusing on Indian Knowledge System topics such as meditation and learning Sanskrit
- How: Delivering easy to get to tools for users to discover and practice Indian Knowledge System based knowledge

Example: Apps like "ThinkRight.me" for mindfulness and "Daily Ayurveda" for health guidance

e) Blockchain for Authenticity

- Blockchain technology to bear out and protect Indian Knowledge System knowledge
- How: preventing unlawful usage and ensuring genuine dissemination of antique texts and formulations

Example: Digital watermarks for Indian Knowledge System manuscripts

f) Artificial Intelligence and Machine Learning

- Language translation and content generation tackle

- How: translating antique Indian texts into contemporary languages and creating engaging, localized content

Example: Artificial Intelligence tools for decoding and explaining complex Sanskrit verses in easy terms

g) Gamification and Edutainment

- Interactive games and edutainment platform
- How: Teaching Indian Knowledge System concepts like Vedic arithmetic or Yoga through fun and attractive formats

Example: Games based on antique Indian epics and educational apps for children

h) Joint Knowledge Hubs

- Online repositories and investigate networks
- How: Platforms for scholars, practitioners and learners to split and access Indian Knowledge System resources

Example: Digital libraries like the National Mission for Manuscripts (NMM)

Challenges of the Indian Knowledge System

a. **Fragmentation and Lack of Accessibility Issue:** IKS is often scattered across ancient texts written in languages like Sanskrit, Pali, or Prakrit, making them inaccessible to the general population.

Effect: Knowledge remains confined to scholars, limiting its broader application.

b. **Loss of Original Context Issue:** Over centuries, many texts have been lost, misinterpreted, or corrupted due to oral transmission and lack of systematic preservation.

Effect: The original intent and methodologies are often diluted or misunderstood.

c. **Lack of Scientific Validation Issue:** Many IKS principles are not rigorously tested through modern scientific methods.

Effect: This leads to skepticism in academia and among the general public, reducing its credibility.

d. **Resistance to Modernization Issue:** Some proponents of IKS resist integrating traditional knowledge with modern science and technology.

Effect: This creates a gap between ancient wisdom and contemporary application.

e. **Limited Documentation Issue:** Incomplete documentation and lack of translations restrict the dissemination of IKS globally.

Effect: Many valuable insights remain unexplored and underutilized.

f. **Decline in Traditional Learning Systems Issue:** Gurukulas and traditional modes of teaching have been replaced by modern education systems.

Effect: Practical knowledge transfer has weakened, and younger generations are less familiar with IKS.

g. **Cultural and Regional Bias Issue:** IKS often reflects the socio-cultural context of its time, which may not align with modern values or global diversity.

Effect: Some practices may seem outdated or culturally specific, limiting universal acceptance.

h. **Commercial Exploitation Issue:** IKS especially in Ayurveda and Yoga, has faced commercialization without proper regulation.

Effect: This dilutes authenticity and undermines its core principles.

i. **Ethical Concerns Issue:** Certain practices (e.g., animal sacrifices in traditional rituals) may conflict with modern ethical standards.

Effect: Such practices face criticism and hinder acceptance in contemporary society.

j. **Lack of Integration in Education Issue:** IKS is rarely included in mainstream education curricula.

Effect: Students lack exposure to this rich heritage, resulting in a disconnect with traditional wisdom.

National Education Policy and Indian Knowledge System Inclusion

The National Education Policy 2020 has emphasized that Indian Knowledge System will be part of the set of courses and will be included scientifically. Indian Knowledge System along with tribal knowledge will be incorporated in mathematics, engineering, philosophy, yoga, medicine, sports, games literature, languages, and a variety of other domains. National Education Policy has paying attention on specific courses in tribal ethno-medicinal practices, forest management, and natural and natural farming. Beneath NEP, IKS will be educated as an optional course for secondary school students. These inputs will be delivered through contemporary technologies, fun games, and cultural swap over programs among different states. National Education Policy focuses on multilingualism and the Indian Knowledge Systemwarehouse has many languages. Under NEP students will be delivered curriculum in their native languages and Sanskrit the most very old language will be taught to all. By learning diverse languages, they will know the rich and varied culture of the nation. The multi-language formula will cover the aspects of Constitutional provisions and it will generate unity and honesty across the nation (National Education Policy 2020). It would be easy to comprise the history of Indian mathematics in usual math classes. The same could be done for structural design, philosophy, and Ayurveda. This is the goal of the National Education Policy 2020, but it will have to be done slowly. There are some challenges when it comes to integrating Indian Knowledge System with National Education Policy 2020. There is a lack of consciousness among the community and stakeholders about the significance of IKS. IKS is usually present in non-literary form and it has been passed verbally from one generation to another. It makes it tricky to develop and implement IKS-based courses and programs in educational institutions. There is no clear-cut curriculum about IKS and it is leaving educationists confused. Many stakeholders may see it as immaterial or outdated. As IKS is obtainable in different languages it may create barriers to those who are not knowledgeable with these languages. Furthermore, the colonial system of education has shaped a bias against the IKS in the Indian Education system. The Indian education system is largely paying attention on the Western knowledge system and it can generate difficulty in accommodating this system. There is also a shortage of well-qualified teachers to teach the IKS because it is not extensively adopted yet.

Conclusion

The inclusion of Indian Knowledge System in India may assist the stakeholders to know their cultural heritage and they may develop a deep understanding of the environment.

The Indian knowledge system provide a profound exploration of ancient Indian wisdom and its connection to the NEP 2020 revealed invaluable insights, encompassing the roots of Indian knowledge, the wisdom contained within ancient scriptures, and the limitless potential of Indian knowledge systems. Additionally, it generated thought-provoking questions regarding the integration of ancient knowledge into modern education, the protection and dissemination of indigenous wisdom, the balance between tradition and modernity, the influence of interdisciplinary approaches, and the promotion of understanding among the younger age group.

ARTIFICIAL INTELLIGENCE IN WOMEN REPRODUCTIVE AND MATERNAL HEALTH: ADVANTAGES, CHALLENGES, AND FUTURE PERSPECTIVES

Chandrakala T S
Research Scholar, Centre for Women Studies, Bangalore University, Bengaluru
Email: chandrakalaphd2023@gmail.com

Abstract

For a long time, talking about reproductive and maternal health has felt like navigating a maze with half the lights out. Information is scattered, clinics are far, stigma gets in the way, and a lot of women end up relying on outdated advice or no advice at all. Artificial intelligence is starting to change that, not by replacing doctors, but by putting reliable, personalized support directly in women's hands. This paper looks at how AI tools are reshaping education and access around pregnancy, fertility, contraception, and postpartum care. Think chatbots that answer questions at 2am without judgment. Voice assistants in local languages that explain what prenatal vitamins do, or what warning signs to watch for after delivery. Apps that learn a person's cycle, symptoms, and context, then tailor guidance instead of giving one-size-fits-all pamphlets. When these tools are designed with women, not just for them, they meet people where they already are: on a phone, in their language, on their schedule. The real shift happens in access. In places where hospitals are hours away or where cultural barriers make face-to-face questions hard, AI can bridge gaps. It can triage, flag high-risk symptoms, connect users to telehealth, and remind them about checkups or vaccines. It can also help community health workers by summarizing patient histories and suggesting next steps, so care is faster and more consistent. Of course, this only works if we get it right. Data privacy, bias in training data, and digital literacy matter. An AI that assumes everyone has stable internet or reads English will miss the women who need it most. The goal here is empowerment, not surveillance. That means transparent models, local partnerships, and content co-created with midwives, doctors, and the women using it. When done well, AI doesn't just deliver information. It builds confidence. Women can ask questions freely, make informed choices, and get timely care. By combining technology with human empathy, we can move from reactive care to education that prevents problems early, and from unequal access to support that actually reaches people.

Keywords: Artificial Intelligence, Women Reproductive health, Women Maternal Health, Advantages, Challenges

Introduction

Reproductive and maternal health are key components of women's well-being. Information and services relating to contraception, pregnancy, childbirth, breastfeeding, postpartum care, and family planning help women make informed decisions. Despite the advances in the healthcare sector, many women continue to face obstacles to access to reproductive and maternal healthcare. Women residing in rural or poor communities may face even more difficulties, such as a long way to the health institution, a lack of transport means, shortage of health workers, insufficient finances, social and cultural barriers, and lack of reliable information about health issues. All these obstacles can lead to delay in seeking health services and adversely affect women's reproductive and maternal health status.

Artificial intelligence (AI) is an emerging area for solving some of these obstacles. AI can be defined as computer-based systems that can carry out various operations related to human intelligence, such as learning from data, identifying patterns, processing language, making predictions, and decision making. In healthcare, AI is used to predict diseases, to provide assistance in clinical decisions, in medical imaging, personalization of health information, patient communication, and health system management. Within the reproductive and maternal health sector, AI can be used for pregnancy monitoring, identification of risk factors, health education, appointment reminders, symptom assessment, and communication between women and health providers. However, technical innovations cannot solve inequalities that exist in the healthcare system. AI algorithms may perpetuate existing inequalities by using incomplete or unrepresentative training data. Women may encounter privacy risks due to collection and processing of sensitive information about their reproductive health. Therefore this paper is to discuss how AI can empower women by reproductive and maternal health. At the same time, it will highlight Advantage, challenges and also ethical, social, technological, and practical challenges in this area.

Objective

To Understand the uses and advantages of AI in women's reproductive and maternal health

To Understand the impact and challenges of AI on women's reproductive and maternal health

Data collection and Analysis method

This study focuses on conducting a descriptive analysis using primary data collected through a questionnaire and secondary data obtained from publicly available government sources.

Reproductive and Maternal health

According to World Health Organisation Reproductive health is a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity, in all matters relating to the reproductive system and to its functions and processes. Reproductive health implies that people are able to have a satisfying and safe sex life and that they have the capability to reproduce and the freedom to decide if, when and how often to do so.

According to World Health Organisation Maternal health refers to the health of women during pregnancy, childbirth and the postnatal period. Each stage should be a positive experience, ensuring women and their babies reach their full potential for health and well-being.

Artificial Intelligence

Artificial Intelligence (AI) is a part of computer science that focuses on making machines work like humans. It enables computers to perform tasks such as learning, thinking, understanding language, and solving problems. AI uses data, algorithms, and computer power to make smart decisions, just like humans do. (AI) is a part of computer science that focuses on making machines work like humans. It enables computers to perform tasks such as learning, thinking, understanding language, and solving problems. AI uses data, algorithms, and computer power to make smart decisions, just like humans do.

Uses and advantages of AI in women's reproductive and maternal health

Easy access to health information: AI can provide women with simple and understandable information about menstruation, contraception, pregnancy, childbirth, breastfeeding, and postpartum care at any time.

Personalized health guidance: AI-based tools can provide information based on a woman's individual needs, age, pregnancy stage, or health concerns.

Early identification of pregnancy risks: AI can help identify warning signs and risk factors during pregnancy, encouraging women to seek medical attention at the right time.

Support for women in rural areas: Women living far from hospitals or health centres can use AI-based applications to obtain basic health information and guidance without travelling long distances.

Improved maternal health education: AI can explain complicated medical information in simple language, helping women better understand pregnancy, childbirth, nutrition, and newborn care.

24-hour assistance: AI-powered chatbots and virtual assistants can provide basic health information around the clock, which is useful when healthcare professionals are not immediately available.

Language-friendly communication: AI can support multiple languages and simplify medical terms, making health information more accessible to women with different educational and language backgrounds.

Improved continuity of care: AI-based digital tools can remind women about antenatal visits, medications, vaccinations, check-ups, and other important aspects of maternal care

Challenges of AI on women's reproductive and maternal health

Limited Digital Access: It is not the case that all women have access to smartphones, computers, a reliable internet connection, or digital healthcare applications, and this issue is more severe in rural and economically disadvantaged areas. A lack of knowledge about digital technologies: There is a possibility that some women do not possess sufficient knowledge or self-confidence when it comes to using AI-based health services, and because of their low level of digital literacy it is hard for them to understand and make the most of these technologies. Language Difficulties: Most AI healthcare tools give insufficient support for local and regional languages, so women who are uncomfortable using English or other major languages will find these tools of less use. Risk of Bias: AI systems base their learning on current health data; if this data fails to accurately represent various groups of women, the system might give rise to biased or less suitable recommendations. Reduced Human Connection: Although AI can offer information and advice, it is not able to completely take the place of the emotional support, physical examinations, and personal care given by doctors, nurses, and midwives. Problems relating to cost and infrastructure: To establish AI-based healthcare services it is necessary to have technology, properly trained staff, internet connectivity, and routine maintenance. It can be difficult to meet these requirements in healthcare settings that are low on resources. The absence of trust and awareness: Certain women and healthcare professionals might be reluctant to use AI since they are not familiar with the technology or because they doubt the reliability of the advice it gives.

Concerns which are ethical and legal: The application of AI in maternal and reproductive healthcare brings into question issues concerning consent, responsibility, transparency, and determination of who should be held accountable when an AI-assisted recommendation results in harm. There is a need for appropriate guidelines to make sure that AI is used in a safe and

responsible manner.

Future Perspectives

AI has the possibility of making reproductive and maternal healthcare more accessible, quicker and tailored to individual needs, but these benefits can only be obtained if the technology is used in conjuction with proper healthcare services and human assistance. The AI based tools should be created in simple and local languages so that women in rural and poorly served areas can use them without difficulty. Furthermore digital literacy courses can help women to learn how to use these technologies and to recognize reliable health information Healthcare professionals must be trained so that they can use AI tools effectively without stopping them from giving patients care that is oriented around people. AI should act as a support to doctors, nurses and community health workers not take their places. Furthermore strong measures need to be put in place to guard women's personal and medical information and to make sure that AI systems are accurate, fair and free from harmful bias overnments and healthcare organisation to put money into affordable digital health infrastructure in maternal and reproductive healthcare is limited. It is important to carry out regular evaluations of AI application in order to make sure that they are safe, effective and useful for various group of women. In the future it will be necessary for healthcare professionals, technology expert, policymakers, researches and communities to work together if AI is developed responsibly and is equally accessible it can become a useful tool for improving reproductive and maternal health for helping people make informed decision and for enabling women to take a more active role in their own healthcare.

Uses of AI in Maternal and Reproductive Health

1. Prediction of Pregnancy Risk: Using AI, it would be possible to Analis the health records of a woman in order to predict possible complications during pregnancy.
2. Fetal Monitoring: AI would help to analyse fetal heart rate and other monitoring indicators in order to detect potential problems.
3. Ultrasound Analysis: Using AI, one could analyse the ultrasound images in order to evaluate the development and growth of a fetus.
4. Identification of Warning Signs for Mother Complications: With the help of AI, it would be possible to identify the signs of pre-eclampsia, gestational diabetes, and other pregnancyrelated complications.
5. Infertility Assessment: AI would help fertility specialists to analyse various health data of a patient in order to assess her infertility and predict fertile periods.
6. Evaluation of Embryos for IVF: AI would assist fertility specialists in the evaluation and selection of embryos during the process of in-vitro fertilization.
7. Individualized Antenatal Care:The analysis of individual health data would allow healthcare professionals to give individualized recommendations concerning antenatal care and nutrition.
8. Remote Monitoring of Pregnant Women: AI-driven digital health apps would be able to facilitate remote monitoring of pregnant women in places where access to medical facilities is restricted.

9. Education on Reproductive Health Issues: Through AI chatbots and digital apps, information about such topics as menstrual cycle, contraception, pregnancy, and family planning could be provided.

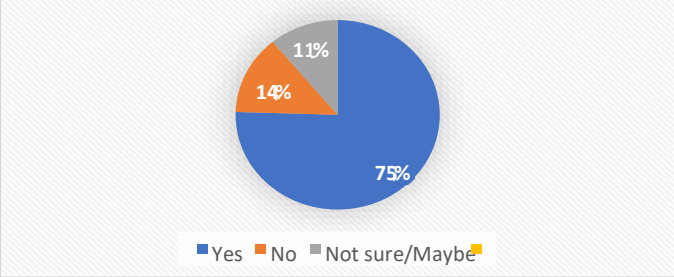
10. Postpartum Support: AI-based apps would give general information and reminders concerning postpartum care, breastfeeding, and care for babies.

Data Analysis:

The questionnaire was carried out on 20 participants, comprising 10 questions about Artificial Intelligence in reproductive and maternal health. Analysis of the response was done using frequency and percentage. Generally, the results suggest that there is a positive attitude towards AI in reproductive and maternal healthcare. From the 200 responses collected, 151 responses (75.5%) answered 'Yes', which shows that majority of the participants view positively the application and the use of AI in the healthcare field. 27 responses (13.5%) answered 'No', suggesting that there is a smaller percentage of the participants who disagreed or were not in support of the statement. 22 responses (11.0%) were 'Not sure/Maybe', indicating that some of the participants have some level of doubt about the role of AI. In general, the analysis suggests that the majority of the participants view positively the use of AI in reproductive and maternal health because of its usefulness in the future. There is need for the participants to be more aware about the application and use of AI in the healthcare field.

Question no	1	2	3	4	5	6	7	8	9	10
Yes	18	12	16	17	15	18	20	8	7	20
No	2	8	0	0	0	0	0	4	13	0
Not sure/maybe	0	0	4	3	5	2	0	8	0	0

Response	**Total**	**Percentage**
Yes	151	75.5%
No	27	13.5%
Not sure/Maybe	22	11.0%
Total	**200**	**100%**



World Health Organization (WHO):

The World Health Organization (WHO) recognizes Artificial Intelligence (AI) as a promising technology for improving sexual, reproductive and maternal health. WHO's 2024 technical brief on AI in sexual and reproductive health and rights highlights the potential of AI to improve access to health information, support screening and prediction, and assist healthcare

services.

This is directly related to the present study because lack of health information and limited access to healthcare can affect women's reproductive and maternal health, particularly in underserved communities. AI-based tools such as chatbots, digital health platforms and decision-support systems can provide women with timely information about menstruation, contraception, pregnancy, maternal care and possible health risks. From the perspective of women's empowerment, access to understandable and reliable health information can help women make informed decisions about their reproductive and maternal health. AI may also help overcome geographical barriers by providing health information digitally to women who have difficulty reaching healthcare facilities. However, WHO also highlights important challenges, including privacy, data protection, bias, misinformation, unequal access to technology and the need for human oversight. Therefore, AI should be used as a supportive tool rather than as a replacement for doctors, nurses or other qualified healthcare professionals.

GARBH-INi programme:

The GARBH-INi programme applies pregnancy-related clinical, ultrasonographic and biological data to design AI tools for pregnancy monitoring, gestational age assessment, and prediction of adverse birth outcomes, including preterm births. Thus, it shows how AI could help with health risk detection and decision-making by the healthcare specialists.

In terms of benefits, AI-based tools designed based on GARBH-INi could enable more precise pregnancy assessment, early health risk prediction, and personalised healthcare services. In particular, such technologies could be particularly useful in India, where women from rural and underprivileged areas may experience problems when receiving timely healthcare specialists' attention. At the same time, some challenges can be highlighted in connection with the GARBH-INI programme example. The AI systems need high-quality and diverse health data, clinical validation and healthcare professionals who could work with them. There is also an issue of confidentiality of women's health information, data use ethics, accuracy and bias, and inequality in access to digital technologies.

Findings:

The study on “Artificial Intelligence in Reproductive and Maternal Health: Advantages, Challenges, and Future Perspectives” found that most respondents have a positive perception of the role of AI in reproductive and maternal healthcare. The overall response showed that 75.5% of the responses were positive, indicating that participants generally recognize the usefulness and potential benefits of AI in healthcare. The findings suggest that AI may provide important advantages such as early identification of pregnancy-related risks, faster access to health information, improved healthcare support, and time-saving services. Respondents also showed confidence in the potential of AI to support pregnant women and improve maternal healthcare. At the same time, the study identified several challenges, including uncertainty about the accuracy of AI-generated health information, concerns about privacy, and limited willingness to depend completely on AI for reproductive and maternal health decisions. Some respondents were unsure about the future use of AI, showing the need for better awareness and education. Overall, the study indicates that AI has significant

potential to improve reproductive and maternal healthcare, but it should be used carefully and responsibly. The future use of AI should focus on accuracy, privacy, accessibility, ethical use, and collaboration between AI systems and healthcare professionals.

Conclusion

AI should not, however, be seen as a replacement for doctors, nurses, or other healthcare professionals. Before it can provide equal benefits to all women, problems such as privacy, data security, the spread of inaccurate information, digital literacy, unequal access to the internet, and affordability have to be dealt with. Particular attention should be given to women who live in rural, remote, and underserved areas. In general, the proper use of AI can improve reproductive and maternal healthcare and help to empower women. If technology is used together with good healthcare services, human supervision, and solid ethical protections, it can enable women to obtain reliable information, make well-informed decisions about their health, and get timely care. The future of AI in the area of reproductive and maternal health should therefore place equal emphasis on technological development as it does on accessibility, equality, safety, and meeting women's needs.

A STUDY OF DIGITAL COMPETENCE AMONG SECONDARY SCHOOL TEACHERS

Dr. Shivakumar G S
Principal , Kumadvathi College of Education, Shikaripura
Mail: drshivakumargs@gmail.com

Abstract

To ensure effectiveness and excellence in the teaching-learning process, teachers need to demonstrate both professional competence and a strong commitment to their responsibilities. In contemporary educational settings, techno-pedagogical competence enables teachers to integrate technological resources with appropriate pedagogical practices, thereby creating learning experiences that are engaging, effective and supportive for both learners and teachers.Techno-pedagogy represents the integration of three interrelated domains: content knowledge, pedagogical knowledge and technological knowledge. It extends beyond the mere use of digital tools and emphasizes the purposeful selection and application of technology to support specific teaching-learning objectives. Thus, techno-pedagogical competence may be understood as a teacher's ability to select, integrate and effectively utilize appropriate technologies in accordance with the content, learners' needs and instructional goals. A techno-pedagogically competent teacher should possess an adequate understanding of educational technologies, including their characteristics, functions, capabilities and instructional applications. Such competence enables teachers to evaluate different technological tools and select those that are appropriate to the subject content, learning context, learner characteristics and intended outcomes. Knowledge of technology alone, howver, does not ensure effective technology integration. Teachers need to understand how technological resources can be meaningfully aligned with appropriate pedagogical strategies. Such integration can promote active participation, interaction and meaningful learning. Teachers equipped with techno-pedagogical competence are therefore better positioned to design technology-supported learning environments that enhance student engagement, concentration and learning outcomes.

Keywords: *Content Knowledge, Pedagogical Knowledge, Technological Knowledge, Digital Teaching Competence, Technology Integration.*

Introduction

Education is a never-ending journey that helps people grow, learn and become strong enough to live worthwhile lives. Teachers know the details of their subjects. Can explain those details to their students. In addition to knowing the subject teachers must learn how to teach so that learning is clear and useful. In today's fast-moving world using technology inside schools has become a must for teachers. That is why teachers must build competence. Techno-pedagogical competence means using technology in a way that fits the way the teacher teaches. Adding technology to what teachers know is now more important than ever.

Teaching is an hard job that needs good subject knowledge many interests, strong teaching skills and the ability to meet each student's needs. Techno-pedagogical competence means the teacher can pick the technology combine it with good teaching and use it to make learning better. For a physical-education teacher with techno-pedagogical competence it is

important to know about the educational tools that exist and how to use them in different lessons and learning moments.

Technology helps spark ideas by turning creative thoughts into real tools, products and ways of doing things. Because of this education and technology are growing together. Technology gives ways to teach and learn. Techno-pedagogical competence of teachers can be seen through technology and teaching skills that Sana, Adhikary and Chattopadhyay (2018) listed. Those skills give a map for looking at how teachers mix technology into their teaching. Techno-pedagogical competence of teachers can. Keep improving if teachers follow several systematic strategies that Sana, Adhikary and Chattopadhyay (2018) suggest. These strategies are shown in Figure 1. Include:

- Strengthening English Language and Online Content Proficiency – helping teachers get better at reading, finding, judging and using online material in English.
- Developing Techno-Pedagogical Skills among Teachers – giving teachers training and chances to grow so they can blend technology with good teaching.
- Creating Sustainable Techno-Pedagogical Support Resources – building easy-to-use and lasting help digital tools and lesson material that make tech-based teaching smoother.
- Developing Techno-Pedagogical E-Content – making interactive subject-focused student-friendly tech-backed digital lessons, for better classroom work.
- Establishing Computer-Based Learning Resource Management Systems – setting up clear systems to sort, keep, reach and share digital learning materials using computers.
- Promoting Research and Development – urging continuous study trying new ideas inventing and building fresh tech and teaching ways to make learning better.

Objectives of the Study

To study the significant differences in techno-pedagogical competence among secondary school teachers with respect to selected demographic variables.

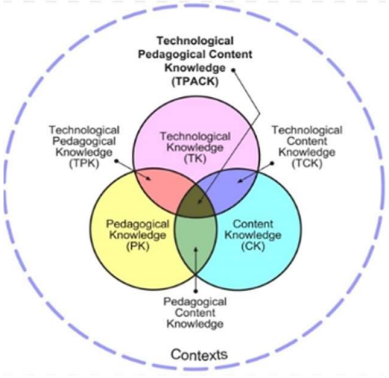

Figure 1: Showing Skills that Support Techno-Pedagogical Competence

Research Methodology

The present investigation adopted a descriptive research design using the survey method for the collection of relevant data. Descriptive research focuses on gathering information about a specific phenomenon and systematically organizing, classifying, tabulating, presenting, and interpreting the collected data. The population of the present study comprised secondary

school teachers working in private schools in Shivamogga District of Karnataka.

For the purpose of the study, the researcher selected a sample of 160 secondary school teachers from 14 private secondary schools, comprising 80 male and 80 female teachers. The sample was selected through the simple random sampling technique to ensure fair representation of the participants. The detailed distribution and classification of the selected teachers are presented in Figure 2.

Research Tool Used for Data Collection

For collecting the required data, the researcher employed the Techno-Pedagogical Competence Scale standardized by S. Rajasekhar and K. Sathya Raj (2013). The scale consists of 40 items designed to assess different dimensions of teachers' techno-pedagogical competence. The instrument covers the following four major areas:

- Use of Technology in Lesson Preparation
- Use of Technology for Motivating Learners
- Use of Technology in Classroom Presentation
- Use of Technology in Assessment and Evaluation

Statistical Techniques Used for Data Analysis

The data collected for the present study were systematically analyzed and interpreted using appropriate statistical techniques. The independent samples t-test was employed to determine the significance of differences in the techno-pedagogical competence of secondary school teachers across the selected groups.

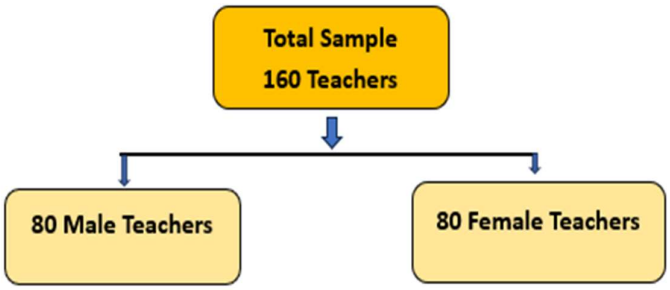

Figure 2: Showing classification of teachers as sample for the collection of data

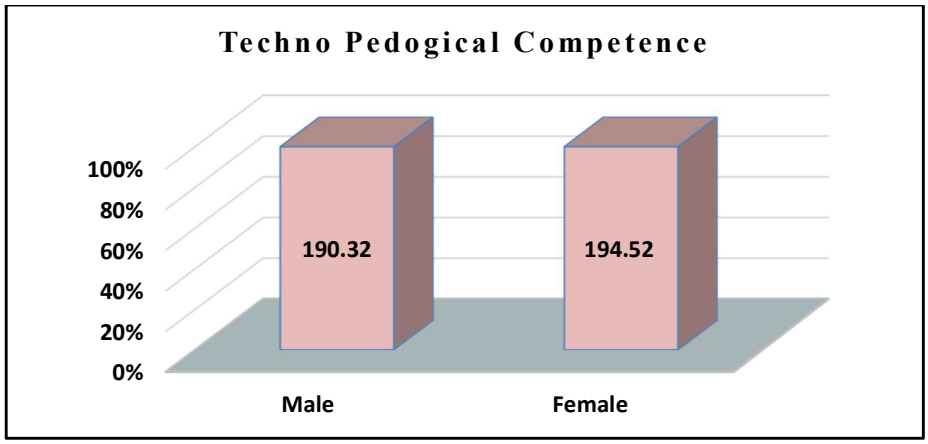
Result Analysis

A result concerning the difference in techno-pedagogical competence between male and female teachers working in private schools. To examine whether there is a significant difference in the techno-pedagogical competence of male and female teachers working in private schools, an independent samples t-test was employed. The obtained results were analyzed and are presented in Table 1.

Type of School	Variable	Gender	N	M	SD	SEd	t-ratio
Private Secondary Schools	Techno Pedagogical Competence	Male	80	190.32	24.52	4.54	1.36
		Female	80	194.52	25.81		

Table:01 Gender Differences in the Techno-Pedagogical Competency of Teachers

Working in Private Schools
(Table value at 0.05 and 0.01 level of significance is 1.98 and 2.62



Graph 1: Showing difference in techno-pedagogical competence of male and female teacher working in private schools

It is evident from the Table 1 that the obtained t-value is 1.36 which is found to be not significant. Therefore, it can be interpreted that there is no difference in techno-pedagogical competence of male and female teacher working in private schools. The difference in means scores is graphically presented in Graph 1.

Conclusion

Effective teaching requires teachers to possess a range of professional competencies, including techno-pedagogical skills, commitment to their profession, effective classroom-management abilities and the capacity to cope with occupational stress, irrespective of the subject they teach. The findings of the present study indicate that both male and female secondary school teachers working in private schools demonstrate a moderate level of techno-pedagogical competence.

Furthermore, the study reveals that the difference in techno-pedagogical competence between male and female secondary school teachers working in private schools is not statistically significant. This suggests that gender does not have a significant influence on the techno-pedagogical competence of secondary school teachers in the selected sample.

PREPARATION OF TEACHER EDUCATION PROGRAMME FOR 21ST CENTURY EDUCATION AND DIGITAL COMPETENCIES, AI LITERACY FOR THE PROFESSIONAL DEVELOPMENT

Dr. Nagaraj H Bommanal
Assistant Professor, S R Kanthi College of Education, Ilkal 587125
E-Mail : bommanalnh@gmail.com

Abstract

The 21st century is remarked as Gen-Z and unrivalled changes in education due to rapid technological advancement, digital transformation, artificial intelligence (AI), and changing learner's needs, and evolving professional acceptances and expectations. These developments necessitate a comprehensive transformation of teacher education programmes to prepare teachers who are digitally competent, AI-literate, innovative, adaptable, and capable of facilitating meaningful learning in technology rich environments. Teacher education institutions have a major responsibility to equip future teachers with the knowledge, skills, attitudes, and ethical practices required to address the emerging demands of contemporary education. This seminar topic focuses on the preparation and restructuring of teacher education programmes in response to the requirements of 21st century education. It highlights the integration of digital competencies, artificial intelligence (AI) literacy, digital pedagogy blended and online learning, educational technologies, digital assessment, and technology enabled collaborative learning into teacher education. AI literacy is particularly important for developing in service and pre service teachers' ability to understand the basic concepts, applications, opportunities, limitations, and ethical implications of AI in education. Teachers need to learn not only how to use AI tools effectively but also how to critically evaluate AI generated information, protect data privacy, address algorithmic bias, and promote responsible and ethical use of technology.This paper further emphasizes continuous professional development of in service teachers and to become skilled through online learning platforms, communities of practice, digital portfolios, webinars, workshops, action research, and co-operative learning. It proposes competency based and practice oriented approaches that enable teacher educators and student teachers to develop digital pedagogical competence and lifelong learning habits. The integration of AI and digital technologies should adjunct, rather than replace, the teachers' professional judgment, creativity, empathy, and human relationships.This seminar presentation concludes that future ready teacher education requires a holistic dynamic curriculum, competent teacher educators, appropriate digital infrastructure, continuous professional development, and strong emphasis on ethics and human values. Preparing teachers for the 21st century is therefore not merely about technological proficiency it is about developing reflective, innovative, responsible, and lifelong-learning professionals capable of using digital technologies and AI to enhance the quality, equity, and effectiveness of education.

Keywords: *Teacher Education, Gen-Z, Digital Competencies, Artificial Intelligence, AI Literacy, Digital Pedagogy, Professional Development, Educational Technology, Lifelong Learning.*

1. Introduction: "The illiterate of the 21st century will not be those who cannot read and write, but those who cannot learn, unlearn, and relearn."- **Alvin Toffler**

21st century has been leading by the Gen-Z and remarked as drastic changes in education system, society, technology, and the living style. The rapid growth of artificial intelligence (AI), digital technologies, online learning platforms, data driven systems, and emerging educational technologies has transformed the way knowledge is created, accessed, shared, and applied. In this changing knowledge ecosystem, teachers are no longer expected to function only as transmitters of knowledge but they are required to become facilitators of learning, designers of meaningful learning experiences, digital pedagogues, mentors, innovators, and lifelong learners. Teacher preparation plays a vital role in preparing teachers to respond effectively to these emerging demands. The quality of school education largely depends on the professional competence, technological preparedness, creativity, adaptability, and ethical awareness of teachers. Therefore, teacher education programmes need to move beyond traditional approaches and integrate 21st century skills, digital competencies, AI literacy, innovative pedagogies, critical thinking, collaboration, communication, creativity, problem solving, and lifelong learning.

Electronic media competency has become an essential component of professional teaching practice. Teachers need to possess the ability to use digital tools and platforms effectively for lesson planning, content development, communication, assessment, classroom management, collaborative learning, and professional development. Now the emergence of generative AI and other AI powered educational applications has created new opportunities as well as challenges for the educators. Teachers as well as the learners need to understand the basic concepts, possibilities, limitations, ethical implications, privacy concerns, bias, academic integrity, and responsible use of AI in teaching learning process.

Professional development should consequently be viewed as a continuous process rather than a onetime training activity. Continuous professional development through workshops, seminars, online courses, collaborative learning, action research, communities of practice, digital learning networks, and reflective practice can help teachers remain professionally competent in a rapidly changing educational environment.

The seminar topic on **"Preparation of Teacher Education Programme for 21st Century Education and Digital Competencies, AI Literacy for Professional Development"** focuses on the need to redesign and redefine teacher education programme in accordance with contemporary educational changes.

2. Contemporary 21st Century Education: The 21st century has begun on 1 January, 2001 and will be going to end on 31 December 2100 therefore we are in the 21st century. This era is marked as Gen.Z ,Gen.Z alpha and Gen.Z beta. Gen Z (Generation Z) means the generation of people generally born between about 1997 and 2012. Those who are born after 2013 they are called Gen.Z alpha and Gen.Z beta. The generation that grew up with smartphones, the internet, social media, and digital technology as a normal part of everyday life is called Gen.Z.

The 21st century has witnessed remarkable developments in information and communication technology, artificial intelligence, automation, digital platforms and global

connectivity. These changes have transformed the nature of knowledge, employment and social interaction. Consequently, education must move beyond merely providing information and should enable learners to apply knowledge creatively and responsibly in real-life situations.

3. Teacher Education in the 21st Century: Teacher education is the Teacher training programme of equipping teacher trainees with the competencies needed to teach effectively, manage classrooms, assess students, and contribute to educational development. It includes both pre service education which means before entering the teaching profession and in service education which means professional development during service.

Teacher Education in the 21st Century means the systematic preparation and continuous professional development of teachers to meet the changing technological, AI, digital, social, cultural, and economic needs of contemporary society. It goes beyond traditional subject knowledge and teaching methods by developing digital competence, AI literacy, critical thinking, creativity, collaboration, communication, ethical awareness, and lifelong learning skills.

- **The role of Teacher educators:** Teacher educators themselves must become lifelong learners and technology enabled professionals. The role of the teacher educator from a knowledge transmitter to a facilitator, mentor, learning designer, researcher, and technology enabled professional. They should be a role model for innovative pedagogy, digital competence, reflective practice, research orientation and ethical use of AI.
- **Essential Competencies required by future teachers:** Trained teachers of Teacher Education in the 21st century need a broad range of competencies to respond effectively to the changing needs and aspirations of learners and society. They should possess strong digital and technological competencies, including the ability to use digital learning platforms, educational technologies, and Artificial Intelligence (AI) responsibly. They need critical thinking, creativity, problem solving, communication, AI communication, collaboration, and adaptability to create meaningful and learner centred educational experiences. Teachers should also demonstrate pedagogical and assessment competencies, understanding diverse learning needs and using innovative teaching strategies and formative assessment techniques. Emotional intelligence, empathy, ethical awareness, cultural sensitivity, inclusivity, and social responsibility are equally important for creating safe and supportive learning environments. The future teachers along with them should develop research skills, lifelong learning attitudes, professional ethics, leadership qualities, and continuous professional development so that they can remain effective, innovative, and responsible educators in the rapidly changing 21st century educational landscape.
- **Digital Competencies required for the Teachers:** Digital competencies refer to the knowledge, skills, attitudes, and abilities required to use digital apparatus effectively, safely, responsibly, and creatively for teaching, learning, communication, professional work, and problem solving.

- **Key Components of Digital Competencies**
  - **Digital Literacy**: It is the ability to access, understands, evaluate, and use digital information.
  - **Digital Communication**: It involves using email, video conferencing, messaging, and collaborative platforms effectively.
  - **Digital Content Creation**: It is the ability to Create presentations, videos, e content, digital worksheets, and interactive learning materials
  - **Digital Collaboration**: It is the attitude of working and sharing resources through online platforms.
  - **Digital Safety**: It is the awareness of protecting personal data, privacy, passwords, and digital identity.
  - **Information Literacy**: It is the ability of identifying reliable information and avoiding misinformation.
  - **Digital Problem Solving**: It is application skill of using technology to solve educational and professional problems.
  - **Responsible Digital Citizenship**: It means using technology ethically, respectfully, and responsibly.
  - **AI Literacy**: Artificial Intelligence is the technical advancement that enables computer based machines to learn, think, understand, and perform tasks in an intelligent manner just like similar to intelligent human beings. This is the new era of literacy which means understanding and using AI tools appropriately, critically, and ethically.
- **Realignment of Teacher education programmes:** In the 21st century demands a shift from traditional teacher preparation towards competency based, technology enabled, and student centred and inclusive professional education. The programmes should integrate digital competencies, AI literacy, critical thinking, creativity, communication, collaboration, problem solving, media and information literacy, socio-emotional skills, and ethical use of technology into the curriculum. Greater emphasis should be placed on experiential learning, project based learning, blended and online learning, contemporary assessment practices, multilingual and culturally responsive pedagogy, inclusive education, and school-community engagement. Student teachers should be trained to use emerging technologies such as Artificial Intelligence, Learning Management Systems, digital content creation tools and educational applications responsibly and effectively. Continuous professional development, reflective practice, action research, internships and collaboration with schools should become integral components of teacher education. The reoriented teacher education programmes can prepare teachers who are competent, adaptable, innovative, ethical and lifelong learners**,** capable of responding effectively to the changing educational needs of the 21st century.

4. **Professional Development of Teacher in AI Era:** Professional Development of Teachers (PDT) is the continuous process of learning. It helps the teachers for improving teachers' knowledge, skills, competencies, attitudes, and professional practices throughout their careers. It enables teachers to update themselves to respond effectively to

changing educational needs, new technologies; diverse learner's needs, and emerging pedagogical approaches. In simple words it means the continuous learning and growth of a teacher to become a more effective and competent educator.

- **Components of Professional Development of Teachers:**
  - **a) Updated Subject Knowledge**: Professional development enables the teachers to update and deepening knowledge of the subject they taught.
  - **b) Contemporary Pedagogical Skills**: It helps the teachers learning innovative and learner centred teaching methods.
  - **c) Digital & media Competencies**: Developing skills in ICT, digital resources, and AI assisted teaching.
  - **d) Assessment Competencies of teachers:** Professional development Improves techniques of formative, summative, and competency based assessment of students.
  - **e) Classroom Management Skills:** Developing effective strategies for managing diverse classrooms needs.
  - **f) Research and Innovation**: Engaging in action research, reflection, and evidence based teaching.
  - **g) Professional Ethics**: Professional development Strengthens commitment, responsibility, values, and ethical practices.
  - **h) Lifelong Learning**: Continuously updating professional knowledge through workshops, seminars, conferences, MOOCs, peer learning, and other learning opportunities.
- **Key Areas of Professional Development:** In the AI era the professional development of teachers refers to effectively integrate Artificial Intelligence (AI), digital technologies, and innovative pedagogies into professional development. AI is transforming the role of teachers from being primarily transmitters of information to becoming facilitators, mentors, learning designers, critical thinkers, and ethical guides.
  - a) **AI Literacy**: Ability to understand the basic concepts, applications, and limitations of AI and familiarity with generative AI tools and AI assisted educational platforms.
  - b) **Lesson Planning using AI:** Ability to use AI to generate lesson ideas, learning activities, questions, and teaching resources.
  - c) **AI Enhanced Assessment:** Developing quizzes, rubrics, question banks, and formative assessment activities with AI assistance.
  - d) **Ethical values for using AI in teaching learning Process:** Understanding privacy, data protection, bias, misinformation, copyright, and academic integrity and teaching students responsible and ethical use of AI.
  - e) **Critical Thinking and AI Verification**: Training the teachers to verify AI generated information; Identifying hallucinations, misinformation, and biased outputs.
  - f) **Continuous Professional Development**: Participating in workshops, webinars, MOOCs, FDPs, conferences, and professional learning communities. It also involves Engaging in action research on AI supported teaching and sharing innovative practices with colleagues.

g) **Digital Pedagogical Competence**: Integrating AI with traditional and digital teaching methods. It also involves designing technology-enhanced and learner-centred learning experiences.

5. Conclusion: The preparation of teacher education programmes for 21st century education requires a fundamental shift from traditional, content centred approaches towards skill based, technology enabled, student centred and nation making teacher preparation. Teachers are no longer merely transmitters of knowledge rather than they are facilitators, mentors, designers of meaningful learning experiences and lifelong learners who must confidently navigate a rapidly changing digital and AI driven educational environment. Therefore, teacher education programmes should systematically integrate digital competencies, AI literacy, critical thinking, creativity, communication, collaboration, problem solving, digital citizenship, data literacy and ethical awareness into both pre-service and in service teacher education. AI should be viewed not as a replacement for teachers but as a powerful tool that can support personalised learning, innovative pedagogy, assessment, professional development and inclusive education while preserving human values and teacher agency. Continuous professional development, hands-on technology integration, reflective practice, experiential learning and strong collaboration between teacher education institutions and schools are essential for preparing future-ready teachers. Ultimately, a reimagined teacher education programme should empower teachers to use technology and AI effectively, ethically, critically and creatively, enabling them to respond to the diverse needs of 21st century learners and contribute meaningfully to an inclusive, equitable, innovative and knowledge driven society.

GENERATIVE AI AS A PEDAGOGICAL TOOL IN BIOLOGY EDUCATION: A REVIEW OF OPPORTUNITIES, CHALLENGES, AND THE TRANSFORMATION OF TEACHING AND LEARNING

Deeksha.H.S.
Lecturer in Biology, D.V.S. PU(Independent) College.
Shimoga-577201

Abstract

Generative Artificial Intelligence (GenAI) is reshaping educational practices by producing explanations, examples, questions, summaries, and other learning resources from natural-language prompts. Biology education is particularly relevant to this development because the discipline involves complex terminology, abstract processes, dynamic systems, data interpretation, and three-dimensional structures. This review examines the pedagogical potential of GenAI in Biology education, focusing on personalised learning, conceptual understanding, lesson planning, assessment, scientific inquiry, and learner engagement. It also examines challenges related to hallucinations, scientific inaccuracy, plagiarism, cognitive offloading, bias, privacy, data security, and unequal access. The review is based on recent systematic reviews, peer-reviewed literature, and international reports, with particular attention to studies addressing science education, teacher education, assessment, and AI literacy. The literature indicates that GenAI can support flexible explanations, differentiated learning, teacher preparation, feedback, and inquiry when its use is aligned with explicit learning goals. However, access to GenAI alone does not constitute pedagogical innovation; teacher mediation and verification remain essential. The paper therefore proposes a Human–AI–Learner framework comprising seven stages: purpose, generate, verify, contextualise, engage, reflect, and demonstrate. The framework positions the teacher as a learning designer, scientific validator, pedagogical facilitator, critical-thinking mentor, and ethical guide. Effective integration of GenAI in Biology education ultimately depends less on the sophistication of the technology than on the quality of pedagogical decisions, scientific verification, learner agency, and responsible use. The review also highlights the implications of GenAI for Biology teacher education and argues that AI literacy should be developed alongside disciplinary knowledge, pedagogical knowledge, and ethical judgement. By combining these dimensions, Biology educators can use GenAI to extend learning opportunities without transferring responsibility for scientific accuracy or educational decisions to an AI system.

Keywords: Generative Artificial Intelligence; Biology Education; Pedagogical Tool; Personalised Learning; AI Literacy; Scientific Reasoning; Teacher Education

1. Introduction

The twenty-first century has brought substantial changes to education through digital innovation. Generative Artificial Intelligence (GenAI) extends earlier digital technologies by enabling interactive generation of explanations, examples, questions, and other learning resources. Its educational significance is reflected in the development of competency frameworks that emphasise human agency, ethics, AI foundations and applications, AI pedagogy, and professional learning (Miao & Cukurova, 2024).

Biology education provides a particularly relevant context for examining GenAI. Biology

operates across levels of organisation from molecules and cells to organisms, populations, communities, and the biosphere. Learners must understand processes such as DNA replication, transcription, translation, cellular respiration, photosynthesis, physiology, and immunity while also interpreting diagrams, analysing data, applying terminology, and transferring knowledge to unfamiliar situations. GenAI can provide alternative explanations and examples, but biological accuracy is essential; therefore, learners must critically evaluate AI-generated information rather than accept it without verification.

Recent reviews indicate growing research interest in GenAI and science education. Cheung et al. (2025) reviewed 22 empirical studies and identified both productive integrations and tensions between GenAI and the epistemic and social aims of science education. Gunsaldi et al. (2025) reviewed GenAI-assisted learning in science education and reported emerging evidence concerning learning outcomes, conceptual mastery, scientific and digital literacy, personalised learning, and motivation. These findings suggest that the central question is not simply whether GenAI should be used, but how it can be integrated effectively and responsibly into Biology teaching and learning.

2. Objectives of the Review

The review aims to:

1. Examine emerging research on GenAI in Biology and science education.
2. Identify major pedagogical applications of GenAI in Biology teaching and learning.
3. Consider its contribution to personalised and learner-centred learning.
4. Examine pedagogical, ethical, and academic challenges.
5. Analyse implications for the changing role of Biology teachers.
6. Identify research gaps and future directions.

3. Review Methodology

This paper adopts a narrative review approach based on recent systematic reviews, peer-reviewed publications, and international reports. Search terms included “Generative AI,” “GenAI,” “artificial intelligence,” “Biology education,” “science education,” “AI pedagogy,” “teacher education,” “personalised learning,” “AI literacy,” and “Generative AI assessment.” Priority was given to recent literature addressing GenAI in science education, student learning, teacher education, assessment, scientific reasoning, pedagogical practice, and ethical issues. The literature was organised thematically around personalised learning and conceptual understanding; instructional design and teacher support; assessment and feedback; scientific inquiry and critical thinking; ethical issues; and teacher competencies and professional development.

4. Generative AI in Biology Education: An Emerging Landscape

GenAI can be considered at three interconnected levels. At the learner level, it can provide explanations, examples, practice opportunities, and dialogue. At the teacher level, it can assist with lesson planning, resource preparation, assessment, and feedback. At the pedagogical level, it can support inquiry, personalised learning, and reflective practice. Qian (2025) similarly identifies pedagogical applications related to learning support, assessment, critical skills, learner autonomy, and teacher–student–AI collaboration.

However, access to a GenAI chatbot should not itself be considered pedagogical innovation. Cheung et al. (2025) emphasise the importance of aligning GenAI interventions with the epistemic aims of science education. In Biology, this means connecting AI-supported activities to disciplinary knowledge, scientific reasoning, evidence evaluation, and authentic learning outcomes.

5. Pedagogical Opportunities

5.1 Personalised Learning

Students differ in prior knowledge, learning pace, language proficiency, and conceptual difficulty.

GenAI can provide alternative explanations, examples, practice questions, and different levels of challenge. For example, a learner struggling with Mendelian inheritance may request a simpler explanation and additional examples, whereas a more advanced learner may request application-based or higher-order questions. Such flexibility can support learner autonomy, but personalisation should remain teacher-directed because AI-generated learning pathways may not match curriculum requirements or individual needs.

5.2 Strengthening Conceptual Understanding

Biology contains many abstract and interconnected concepts. GenAI can present stepwise explanations, comparisons, analogies, and question-driven explanations for topics such as DNA replication, transcription, translation, cellular respiration, and hormonal regulation. Nevertheless, simplified analogies can create misconceptions. Teacher mediation and verification against authoritative biological sources are therefore necessary.

5.3 Planning and Teacher Support

GenAI can assist teachers in preparing lesson plans, learning objectives, discussion prompts, worksheets, case studies, and differentiated activities. This can reduce routine preparation time and allow greater attention to teaching and learner support. However, AI-generated plans should be treated as drafts. Teachers must evaluate their curriculum alignment, scientific accuracy, developmental appropriateness, and contextual relevance (Qian, 2025).

5.4 Assessment and Feedback

GenAI can generate multiple-choice questions, short-answer questions, case scenarios, higher-order questions, and preliminary feedback. At the same time, easy access to AI-generated answers challenges assessment practices that reward simple reproduction of information. Assessment should therefore emphasise reasoning, application, explanation, practical skills, reflection, and authentic performance.

5.5 Scientific Inquiry and Reasoning

GenAI can itself become an object of scientific inquiry. Learners may examine an AI-generated explanation, identify its claims, test those claims against scientific evidence, identify inaccuracies, revise the explanation, and justify their conclusions. Such activities can turn AI use into an opportunity to develop scientific reasoning and critical evaluation rather than passive information consumption.

5.6 Learner Engagement

Interactive AI systems can encourage learners to ask questions, seek clarification, and explore ideas. Nevertheless, engagement should not be treated as an outcome in itself. Meaningful

engagement must be connected to clearly defined conceptual and scientific learning gains.

6. Challenges and Ethical Considerations

6.1 AI Hallucinations and Scientific Accuracy

GenAI may produce information that appears convincing but is factually incorrect. In Biology, inaccurate explanations can create persistent misconceptions. Consequently, AI-generated biological information should be checked against recognised textbooks, peer-reviewed literature, and other reliable scientific sources.

6.2 Academic Integrity and Plagiarism

GenAI can produce essays, assignments, and examination responses rapidly, creating concerns about inappropriate use and academic integrity. Rather than relying solely on prohibition, institutions should establish clear expectations for responsible AI use, attribution, and verification. Assessment should also require learners to demonstrate their own reasoning and understanding.

6.3 Cognitive Offloading

Easy access to generated answers may reduce learners' willingness to struggle with challenging problems. A more productive approach is to ask learners to formulate an explanation or solution first and then use GenAI to compare, critique, and improve their work. This preserves learner agency while using AI as a scaffold.

6.4 Bias

GenAI outputs may reflect biases in training data or fail to represent the nuances of particular issues. Learners therefore require AI literacy that enables them to identify assumptions, compare outputs with credible sources, and treat AI responses as material for inquiry rather than unquestionable authority.

6.5 Privacy and Data Security

The use of AI systems raises questions about the information entered into platforms and how such information may be processed. UNESCO guidance emphasises human agency, ethical use, and protection of learners and educators (Miao & Holmes, 2023). Educational institutions should therefore establish responsible practices for data protection and AI use.

6.6 Digital Divide

Unequal access to devices, reliable internet connectivity, and AI tools can create disparities in learning opportunities. Responsible integration should therefore consider accessibility and should not make essential learning dependent on resources that some learners cannot access.

7. Redefining the Role of the Biology Teacher

GenAI does not necessarily eliminate the need for Biology teachers; rather, it can transform their roles. Teachers increasingly act as learning designers, scientific validators, pedagogical facilitators, critical-thinking mentors, ethical guides, and lifelong learners. The AI competency framework for teachers highlights the importance of AI literacy for ethical and effective educational use (Miao & Cukurova, 2024). Biology teachers do not need to become computer scientists, but they require sufficient AI literacy to evaluate outputs, design appropriate activities, and protect scientific and educational quality.

8. Implications for B.Ed. and Biology Teacher Education

Teacher education programmes should incorporate AI literacy and provide student teachers

with opportunities to use GenAI for Biology-related explanations, questions, examples, lesson activities, and assessment tasks. Student teachers should also be trained to verify AI-generated biological information using recognised textbooks and scientific literature. They need experience in identifying hallucinations, bias, privacy risks, and inappropriate dependence on AI. Teacher education should further address the ethical, social, pedagogical, and professional implications of GenAI. Spasopoulos et al. (2025) highlight the growing relevance of GenAI in pre-service science teacher education, reinforcing the need for structured preparation rather than uncritical adoption.

9. Research Gaps and Future Directions

The literature remains broader in science education than in Biology education specifically.

Future research should therefore examine Biology-specific applications and learning outcomes.

Longitudinal studies are needed to determine whether reported benefits persist over time.

Comparative studies should examine guided and unguided GenAI use and investigate whether AI-supported learning improves biological reasoning and conceptual understanding rather than only short-term performance.

Research is also needed in Indian Biology classrooms and teacher education contexts, particularly concerning language, accessibility, curricular relevance, and teacher readiness.

Further studies should investigate pedagogical strategies that enable learners to detect, verify, and correct scientifically inaccurate AI-generated information. These directions shift attention from whether GenAI can be used to which pedagogical conditions optimise learning with GenAI.

10. Proposed Human–AI–Learner Framework for Biology Education

Based on the reviewed literature, a Human–AI–Learner framework is proposed with seven stages.

Stage 1 – Purpose: The teacher identifies the intended learning gain and determines whether GenAI has genuine pedagogical value.

Stage 2 – Generate: The teacher or learner uses GenAI to generate explanations, questions, examples, or activities.

Stage 3 – Verify: The teacher checks the generated content against reliable biological references.

Stage 4 – Contextualise: The information is aligned with curriculum requirements, learner needs, and the specific Biology context.

Stage 5 – Engage: Learners question, discuss, investigate, explore, reflect, and collaborate with the material.

Stage 6 – Reflect: Learners critically evaluate the learning process and the accuracy of the AI-generated information.

Stage 7 – Demonstrate: Learners independently demonstrate mastery through appropriate assessment strategies.

The framework places human judgement between GenAI use and educational outcomes. It positions GenAI as a support for learning rather than an end in itself and reinforces the need for scientific verification and teacher mediation.

11. Conclusion

GenAI has the potential to enrich Biology education through personalised explanations, interactive learning, teacher support, assessment assistance, and opportunities for scientific inquiry. Recent reviews indicate promising applications while also identifying concerns related to overreliance, scientific accuracy, higher-order reasoning, academic integrity, and social learning (Cheung et al., 2025; Gunsaldi et al., 2025; Marzano, 2026). These findings suggest that GenAI is not inherently beneficial or harmful; its educational value depends on how it is mediated. For Biology education, scientific accuracy is particularly important. Teachers and learners must distinguish between AI-generated information and information verified through credible scientific sources. Therefore, responsible GenAI integration should prioritise human judgement, learner agency, critical evaluation, ethical practice, and disciplinary accuracy. The central issue is not whether GenAI should be used in Biology education, but how it can be used to support scientifically rigorous, learner-centred, inquiry-based teaching and learning.

FROM TOOL ADOPTION TO PROFESSIONAL JUDGEMENT: REFRAMING RESTRAINT AS A CORE COMPETENCY IN TEACHER AI EDUCATION

Introduction

When educators began to integrate generative AI into classrooms prior to teachers receiving adequate formal education on how to utilize generative AI tools appropriately, international organizations established competency frameworks for A.I. education. UNESCO led the charge with its A.I. Competency Framework for Teachers, which outlined the necessary skills for educators to develop toward competent use of AI in the classroom. These models however have one major flaw: each assumes that increased use of AI tools will lead to increased professional competence. Using an A.I. tool intentionally and at a point when you are choosing to abstain from using it is considered a deficiency, an anxiety, or a lack of skill. This article challenges the premise. By examining UNESCO's guidelines, and scholarly literature about developing A.I. literacy (Long & Magerko, 2020), and recent systematic review articles (Almatrafi, Johri, & Lee, 2024) we developed a three tier framework of operational adoption, critical evaluation, and professional judgment. Based upon our examination we determined that purposeful and reasoned rejection of A.I. use (which we define as pedagogical restraint) is not a deficiency. Rather it represents the highest level of professional judgment. Framing pedagogical restraint as a competency can immediately affect how teachers receive training and how teachers are evaluated. Given the unique characteristics of Indian educational systems, characterized by linguistic diversity and varying levels of resources available to schools, framing pedagogical restraint as a competency is essential if the goals of National Education Policy (NEP) 2020 are to be achieved. This paper provides no empirical data. It presents an argument that the definition of an educator's professional identity in an age of automation should include the justifiability of an educator's decisions regarding whether or not to automate parts of the educational process The most visible benchmark to date is UNESCO's "AI Competency Framework for Teachers (Miao & Cukurova, 2024), a framework that represents how educational developers map developmental milestones to help guide teachers' from elementary to advanced uses of AI in their teaching. The second was created based on prior work (protecting teacher autonomy and using the commonly referenced by Long and Magerko (2020), widely used definition of AI literacy as the ability to communicate with, critically evaluate, and effectively utilize AI systems. In each of these works there is an implied message: that continuous professional growth is one continuous ladder where any level of greater proficiency will translate directly to increased frequency, depth, and complexity of use of software. While this view is certainly clear; however it is also theoretically incorrect. The way that current definitions define competency solely based upon activity creates a very large gap: a teacher's intent to not use AI in a particular instance of

instruction has no legitimate conceptual basis. All non-use can be seen as either reluctance to use technology, fear/technology phobia, or professional incompetence. However, many skilled teachers have made purposeful choices to withhold technology throughout their entire careers. For example, a teacher makes the decision not to allow an automated grading program generate feedback about a young students creative writing piece because she feels that the young writer needs encouragement and a relationship. A teacher chooses to reject a pre-made lesson plan provided by an automated program that incorporates a national education standards curriculum because it does not include the local/cultural nuances that are present in her region. A teacher continues to provide time-consuming, human led dialogues for class discussions to give students the opportunity to think through problems in their minds so that they may learn at their own pace. These are not examples of digital illiteracy. These are examples of instructional restraint.

We argue that restraint should be considered a key aspect of professional competency as opposed to the lack of technical skills. Omitting this competency from current frameworks would skew the focus of teacher preparation programs and create inaccurate and biased methods to measure teacher performance during professional development. Furthermore, omitting this competency would leave educators without resources and support when pressured by schools and districts to demonstrate "visible technology" usage for its own sake.

Problem Statement and Research Gap

The UNESCO competency model for AI literacy consists of fifteen competencies across five categories and various levels of development. While it repeatedly emphasizes the importance of human accountability in decision-making processes within AI systems, the UNESCO model describes a linear progression of increasing complexity - where educators begin at awareness and progress to application and then to creating; each step involves adding new abilities to the educator's skill set to increase capability. Similarly, Long and Magerko (2020) in their original definition of AI literacy also assume a linear progression based upon the educator using more advanced capabilities through AI. In their model, the critical thinking process of evaluating is something that educators do when using an AI system and is never defined as a reason to turn off the machine. Almatrafi, Johri, and Lee (2024), authors of a recent systematic review of five years of AI literacy literature identified six common construct categories within AI literacy literature: recognize, know/understand, apply/use, evaluate, create, navigate ethically. Not one of these categories identifies abstaining from the use of an AI tool as an independent measureable construct. "Navigating Ethically", however, is the most similar category to describing abstaining from AI. However, as Almatrafi, Johri, and Lee (2024) identify, researchers have consistently operationalized navigating ethically as using an AI tool ethically, rather than choosing not to use an AI tool. It was reasonable that researchers would emphasize the positive aspects of AI usage in its early years. There were numerous institutional barriers that had to be overcome prior to researchers being able to assert the educational value of AI. Additionally, Zawacki-Richter et al. (2019) illustrated in their systematic review of literature on higher education that technological and administrative priorities dominated pedagogical views in the literature. Prior to developing theories regarding the limitations of AI tool use, researchers had to argue for the use of tools in order to develop

theories about those limitations. Those days are over. Today generative tools are widely used. However, the conceptual vocabulary surrounding educators' attitudes towards AI tools has yet to evolve to include a formal vocabulary that allows educators to articulate why they might want to evaluate an AI tool, understand the full range of features available in an AI tool and make a deliberate decision to exclude that tool from a lesson plan.

Conceptual Framework

Developing Vocabulary

Constructing this missing vocabulary will require bringing together three different lines of theoretical thought. First, is UNESCO's founding concept of teacher agency: educators must always be responsible for the pedagogical outcomes in any classroom, whether or not technology is present in the classroom. True agency, however, can't simply represent the ability to choose what to do with a tool; true agency must also include the power to argue against the use of tools. The obligation of being accountable mandates having the right to say no.

Secondly, there's the difference between descriptive AI literacy (the understanding of how algorithms operate) and applied AI competency (the skillful application of this knowledge). If an educator realizes that a foundation model generates citations randomly, repeats culturally biased stereotypes, or loses important nuances of language through translation; then competent practice will involve taking action based upon that realization. Sometimes the actions taken may require adjustments to prompts. More often than not, they'll result in refusing to utilize the tool.

Almatrafi et al. (2024) have developed an inventory of critical evaluation competencies necessary for educators to evaluate AI-generated materials. However, the literature has failed to provide evidence validating non-use as a valid conclusion of the evaluation process.

Third, the idea of professional judgement in teacher preparation continues to exist. Professional judgement involves evaluating multiple pedagogically appropriate, ethically appropriate and situationally appropriate variables while under conditions of real classroom uncertainty. Teaching is not merely completing a list of procedures. Therefore, AI competency will need to include situational judgement regarding when algorithmic support would be appropriately incorporated within a particular instruction sequence.

Main Analytical Discussion

Pedagogical restraint remains unaccounted for in contemporary models because current competency models resemble ladders. As each rung ascends, so too does the complexity of using software. Ladder-based models work very well for developing sequential technical skills such as writing programs or analyzing large datasets. However, professional judgment moves in two directions.

At first glance, she sits at the bottom of the “application” level of a standard competency ladder. But, as it turns out, there is much more to her thought process. She understands the limitations of algorithms better than a colleague who mechanically inserts his or her AI-generated lesson plan directly into a lesson record. Unfortunately, she will receive no credit from the ladder. The ladder will classify her informed refusal to utilize the software as an operational failure. As a result of this gap in the ladder, three negative outcomes occur in

practice:

1. Misleading Professional Development: Programs designed to measure adoption are based on how frequently an educator uses the software rather than on how well they have used their pedagogical expertise. Since educators are measured by how often they use their software, training programs will promote visible, frequent use of software regardless of whether the educator's reason for using the software was to support student learning or merely due to a desire to check all the boxes required by an administrator.
2. Incorrectly Classified Teacher Ability: Teachers who exhibit cautious restraint when deciding whether to utilize technology may incorrectly be classified as having difficulty utilizing technology. These educators would then be penalized, or be required to attend additional training sessions, while educators who continue to mindlessly paste AI-generated content into lesson records are rewarded.
3. Reduced Teacher Authority: The absence of an established method of evaluating restraint creates difficulty for educators to explain their choice of not using the software when explaining such choices to school administrators, supervisory staff members, and/or parents who believe that innovative education must include extensive amounts of screen-time. The resulting pressure to utilize technology without critical evaluation will create top-down pressures to rapidly implement untested technology.

Professional Judgement is the decisive top tier. It helps to convert critical thinking about pedagogy to pedagogically justifiable actions. Pedagogic restraint refers to the ethically justified and situational rational basis upon which a teacher decides not to deploy AI tools. As such, the restraint depicted here is not antithetical to competency but is instead an overt manifestation thereof, occurring in tandem with deliberated deployment as part of the same evaluative process.

This model diverges from traditional hierarchical depictions of skills in two respects. Firstly, these layers are non-linear. For example, a teacher may exhibit advanced professional judgment using only elementary operational tools because their ability to make judgments is what guides their decision-making rather than proficiency in technical feats. Secondly, this model depicts adoption and restraint as complementary outcomes. This enables educators to explicitly measure teachers' professional judgment, and therefore eliminate the necessity of assessing teachers' ability to rapidly operate the software.

Implications for Teacher Education and Professional Development

Adoption of this model necessitates a transformation of teacher education. Rather than solely emphasizing tutorial training on software, teacher training programs should incorporate scenario-based training exercises where trainees must engage in debate regarding and defense of both their decision to employ AI, and their decision not to do so. Moreover, evaluation rubrics used by training programs must focus beyond assessment of operational fluency to determine the degree to which a candidate has considered learners' privacy, developmental suitability, linguistic integrity and cognitive engagement when employing AI.

This view is particularly relevant in India. National Education Policy (NEP) 2020 seeks to strike a balance between digital education initiatives and robust requirements for equitable, multilingual and student centered pedagogy. In addition, given the linguistic diversity of many

classrooms in India, teachers will need to regularly make the determination of whether English-centric models can be employed to support instruction in regional languages without compromising the cultural nuances that students bring into those classrooms. Rehman, Dar, and Rasool (2025), in their examination of AI literacy within Indian higher education and the Viksit Bharat 2047 vision, suggest that India requires frameworks that are contextually relevant versus ones that have been adopted wholesale from outside the country. A restraint-inclusive framework provides an opportunity for Indian teacher education programs to pursue the technological objectives outlined in NEP 2020 without presuming that each time AI is utilized, it will inherently represent better pedagogical practice than careful consideration not to utilize AI.

Challenges and Limitations

This model is conceptual and has not been empirically tested; its practical value depends on future work operationalising Professional Judgement, including restraint, into observable indicators or assessment items, which lies beyond the scope of this paper. There is also a risk that "restraint" could be misapplied as a rationalisation for avoiding AI engagement altogether, rather than as a reasoned, case-specific judgement; the model depends on restraint being justified and articulable, not simply asserted, and teacher-education programmes would need to guard against the former reading. Finally, the model's three layers, while conceptually distinct, will in practice interact and overlap in ways a short conceptual paper can only gesture toward; a fuller treatment would need to engage with how institutional pressures, workload, and infrastructural access shape the space in which teachers can realistically exercise judgement at all.

Conclusion

This paper has argued that current AI-competency frameworks for teachers, though valuable, are structured around a logic of increasing engagement that leaves no positive place for the reasoned refusal to engage. Drawing on UNESCO's competency and ethics guidance and on foundational and recent AI-literacy scholarship, it has proposed a three-layer model, Operational Adoption, Critical Evaluation, and Professional Judgement, in which pedagogical restraint is reframed as a defining feature of advanced competence rather than a deficit. For teacher education and professional development, and particularly for Indian teacher-preparation programmes navigating NEP 2020's dual commitments to technology integration and equitable pedagogy, this reframing suggests that what should be cultivated and assessed is not simply a teacher's fluency with AI tools but their capacity to account, defensibly and reflectively, for when those tools belong in the classroom and when they do not. A smart teacher, on this account, is not defined by how much AI they use, but by how well they can justify the choices they make about it.

Abstract

The present study was undertaken to investigate the teaching effectiveness of degree college lecturers in relation to scientific creativity, attitude towards artificial intelligence, and scientific attitude. The study was conducted among 200 degree college lecturers working in different degree colleges of Kalaburagi District of Karnataka. A descriptive survey method was adopted for the study. Teaching Effectiveness, Scientific Creativity, Attitude towards Artificial Intelligence, and Scientific Attitude were considered as the major variables. Data were collected using standardized/researcher-developed rating scales. The data were analyzed using percentage, mean, standard deviation, independent sample t-test, F-test (ANOVA), and Pearson's product-moment correlation (r-test). The findings are expected to reveal whether teaching effectiveness differs significantly according to selected demographic variables and whether it is significantly related to scientific creativity, attitude towards artificial intelligence, and scientific attitude. The study has implications for teacher education, professional development, AI-integrated teaching, and improvement of the quality of higher education.

Keywords: *Teaching Effectiveness, Degree College Lecturers, Scientific Creativity, Artificial Intelligence, Scientific Attitude,*

1. Introduction:

Higher education plays a vital role in the intellectual, scientific, social, and economic development of a nation. The quality of higher education largely depends upon the quality and effectiveness of teachers. Degree college lecturers are responsible not only for transmitting subject knowledge but also for developing critical thinking, creativity, scientific temper, problem-solving abilities, and technological competencies among students.

Teaching effectiveness is a multidimensional concept that involves the lecturer's ability to plan and organize instruction, present subject matter effectively, use appropriate teaching methods and learning resources, motivate students, manage the classroom, assess learning outcomes, and provide constructive feedback.

In the contemporary educational environment, scientific creativity has become increasingly important. Scientific creativity enables lecturers to generate new ideas, identify problems, formulate hypotheses, design innovative approaches, and solve problems in novel ways. A

scientifically creative lecturer can provide students with learning experiences that go beyond memorization and encourage inquiry and innovation.

The rapid development of Artificial Intelligence (AI) has brought significant changes to higher education. AI-based tools can support lesson planning, content generation, personalized learning, assessment, research, data analysis, and academic administration. However, effective use of AI depends substantially on lecturers' knowledge, acceptance, confidence, and attitude towards AI. A positive attitude towards AI may encourage lecturers to explore innovative pedagogical practices.

Similarly, scientific attitude is essential for effective teaching. Scientific attitude includes objectivity, curiosity, open-mindedness, rationality, critical thinking, intellectual honesty, willingness to verify facts, and respect for evidence. Lecturers possessing a strong scientific attitude are likely to encourage students to think logically and critically.

Therefore, it is worthwhile to examine the relationship between teaching effectiveness and these three important characteristics—scientific creativity, attitude towards AI, and scientific attitude—among degree college lecturers.

2. Need and Significance of the Study:

The higher education system is undergoing rapid transformation because of technological development, changing learner needs, competency-based education, and the emergence of artificial intelligence.

The present study is significant for the following reasons:

1) Improvement of teaching quality: It helps identify factors associated with effective teaching among degree college lecturers.
2) Promotion of scientific creativity: Scientific creativity can help lecturers adopt innovative teaching strategies.
3) AI integration: Understanding lecturers' attitudes towards AI can support effective and responsible integration of AI into higher education.
4) Development of scientific attitude: Scientific attitude promotes evidence-based teaching and critical thinking.
5) Professional development: The findings can help colleges design appropriate faculty development programmes.
6) Policy formulation: Educational administrators can use the findings to develop training programmes for lecturers.
7) Regional relevance: The study provides empirical information regarding degree college lecturers in Kalaburagi District of Karnataka.

3. Statement of the Problem:

Teaching Effectiveness of Degree College Lecturers in Relation to Scientific Creativity, Attitude towards Artificial Intelligence, and Scientific Attitude.

4. Operational Definitions of the Terms:

1) Teaching Effectiveness:

In the present study, Teaching Effectiveness refers to the degree to which a degree college lecturer successfully plans, organizes, presents, manages, assesses, and evaluates the teaching-learning process and achieves the intended learning outcomes.

2) Scientific Creativity:

Scientific creativity refers to the ability of a lecturer to generate original and useful ideas, identify problems, formulate alternative explanations, think divergently, and develop innovative solutions in scientific and academic contexts.

3) Attitude towards Artificial Intelligence:

Attitude towards Artificial Intelligence refers to the lecturer's degree of awareness, acceptance, perceived usefulness, confidence, willingness, and positive or negative disposition towards the use of AI in teaching, learning, assessment, research, and academic activities.

4) Scientific Attitude:

Scientific attitude refers to a disposition characterized by curiosity, objectivity, rationality, open-mindedness, critical thinking, willingness to examine evidence, intellectual honesty, and readiness to modify conclusions based on evidence.

5) Degree College Lecturers:

In the present study, degree college lecturers refer to teachers working in undergraduate degree colleges located in Kalaburagi District of Karnataka.

5. Objectives of the Study:

The study was conducted with the following objectives:

1) To find out whether there is a significant difference in teaching effectiveness with respect to Gender
2) To find out whether there is a significant difference in teaching effectiveness with respect to teaching experience
3) To determine the relationship between teaching effectiveness and scientific creativity.
4) To determine the relationship between teaching effectiveness and attitude towards artificial intelligence.
5) To determine the relationship between teaching effectiveness and scientific attitude.

6. Hypotheses of the Study:

The following null hypotheses may be formulated:

1) H01: There is no significant difference in the teaching effectiveness of degree college lecturers with respect to gender.
2) H02 : There is no significant difference in teaching effectiveness among lecturers with different levels of teaching experience.
3) H03: There is no significant relationship between teaching effectiveness and scientific creativity.
4) H04: There is no significant relationship between teaching effectiveness and attitude towards artificial intelligence.
5) H05: There is no significant relationship between teaching effectiveness and scientific attitude.

7. Methodology:

7.1 Method:

The **Descriptive Survey Method** was adopted for the present study.

7.2 Population:

The population consisted of lecturers working in degree colleges in Kalaburagi District of

Karnataka.

7.3 Sample:

A sample of 200 degree college lecturers was selected from different degree colleges of Kalaburagi District.

A suitable sampling procedure such as stratified random **sampling** were adopted to ensure representation of lecturers from different types of colleges and demographic groups.

8. Tools for Data Collection:

The following tools have been used:

1. Verbal Test of Scientific Creativity by V.P. Sharma and J.P. Shukla (2006).
2. Attitude towards Artificial Intelligence Scale Prepared and Standardized by Investigator
3. Scientific Attitude Scale Developed by Dr. J.K. Sood and R.P. Sandhya
4. Teaching Effectiveness Scale Developed by Dr. Pramod Kumar & D.N. Mutha

9. Statistical Techniques:

The collected data may be analyzed using:

1) Mean: To determine the average score.

2) Standard Deviation: To determine the variability of scores.

3) Independent Sample t-Test: To determine significant differences between two groups.

4) F-Test / One-Way ANOVA: To determine significant differences among three or more groups.

5) Pearson Product-Moment Correlation (r-Test): To determine the relationship between the major variables.

The level of significance may be fixed at: **0.05 and 0.01 levels.**

10. Data Analysis based on hypotheses:

1. **H01: There is no significant difference in the teaching effectiveness of degree college lecturers with respect to gender.**

Table 2: Mean, SD and *t*-Value of Teaching Effectiveness by Gender

Gender	N	Mean	SD	*t*-value	Significance
Male	120	78.42	8.16	1.52	Not Significant
Female	80	80.18	8.31		

Note: Critical *t*-value at 0.05 level of significance (df = 198) ≈ **1.97**.

The above table presents the comparison of teaching effectiveness of degree college lecturers with respect to gender. The sample consisted of 200 lecturers, of whom 120 were male and 80 were female. The mean teaching effectiveness score of male lecturers was 78.42, with a standard deviation of 8.16, whereas the mean score of female lecturers was 80.18, with a standard deviation of 8.31. Thus, female lecturers obtained a slightly higher mean teaching effectiveness score than male lecturers. The obtained *t*-value was 1.52. The critical *t*-value at the 0.05 level of significance for 198 degrees of freedom is approximately 1.97. Since the obtained *t*-value (1.52) is less than the critical *t*-value (1.97), the difference between the mean teaching effectiveness scores of male and female lecturers is not statistically significant at the 0.05 level. Therefore, the null hypothesis is retained. It may be concluded that there is no significant difference in the teaching effectiveness of male and female degree college

lecturers. Although female lecturers show a somewhat higher average teaching effectiveness score (80.18) than male lecturers (78.42), the difference is not large enough to be considered statistically significant. Hence, gender does not appear to have a significant influence on the teaching effectiveness of degree college lecturers in the present hypothetical study

2. **H02 : There is no significant difference in teaching effectiveness among lecturers with different levels of teaching experience.**

Table 3: ANOVA of Teaching Effectiveness According to Teaching Experience

Source of Variance	SS	df	MS	F	Significance
Between Groups	1,286.40	2	643.20	4.62	Significant
Within Groups	27,411.60	197	139.15		
Total	28,698.00	199			

Critical F-value at 0.05 level of significance for df = (2, 197) is approximately 3.04.

The above table shows the results of the one-way ANOVA conducted to determine whether there is a significant difference in the teaching effectiveness of degree college lecturers with respect to their teaching experience. The total sum of squares is 28,698.00, of which 1,286.40 is attributed to differences between the three experience groups, while 27,411.60 is attributed to differences within the groups. The corresponding degrees of freedom are 2 and 197, respectively. The mean square between groups is 643.20, and the mean square within groups is 139.15. The obtained F-value is 4.62. The critical F-value at the 0.05 level of significance for degrees of freedom 2 and 197 is approximately 3.04. Since the obtained F-value (4.62) is greater than the critical F-value (3.04), the result is statistically significant at the 0.05 level. Therefore, the null hypothesis is rejected. It may be concluded that there is a significant difference in the teaching effectiveness of degree college lecturers with low, medium, and high teaching experience. The significant F-value indicates that at least one of the three experience groups differs significantly from another in teaching effectiveness. However, ANOVA alone does not indicate exactly which groups differ. Therefore, a post-hoc test such as Tukey's HSD may be conducted to identify the specific pairs of experience groups showing significant differences. Overall, the hypothetical findings suggest that teaching experience is significantly associated with the teaching effectiveness of degree college lecturers. This may indicate that lecturers' teaching effectiveness tends to vary according to their level of professional teaching experience.

3. **H03: There is no significant relationship between teaching effectiveness and scientific creativity.**

Table 4: Correlation between Teaching Effectiveness and Scientific Creativity

Variables	N	*r*-value	Significance
Teaching Effectiveness × Scientific Creativity	200	**0.58**	**Significant at 0.01 level**

The obtained r-value of 0.58 is significant at the 0.01 level.

The above table presents the relationship between teaching effectiveness and scientific creativity among degree college lecturers. Pearson's product-moment correlation coefficient was employed to determine the nature and strength of the relationship between the

two variables. The obtained correlation coefficient between teaching effectiveness and scientific creativity is 0.58 for a sample of 200 lecturers. The correlation is positive, indicating that lecturers who possess higher levels of scientific creativity tend to demonstrate higher levels of teaching effectiveness. The obtained r-value of 0.58 indicates a moderate to moderately strong positive relationship between teaching effectiveness and scientific creativity. Since the correlation is statistically significant at the 0.01 level, the observed relationship is unlikely to have occurred merely by chance. Therefore, the null hypothesis of no significant relationship between teaching effectiveness and scientific creativity is rejected. It may be concluded that there is a significant positive relationship between teaching effectiveness and scientific creativity among degree college lecturers. In practical terms, the finding suggests that scientifically creative lecturers may be more effective in their teaching, possibly because scientific creativity can support innovative teaching methods, problem-solving, experimentation, critical thinking, and the development of engaging learning experiences. Thus, the hypothetical result indicates that scientific creativity is an important correlate of teaching effectiveness among degree college lecturers.

4. H04: There is no significant relationship between teaching effectiveness and attitude towards artificial intelligence.

Table 5: Correlation between Teaching Effectiveness and Attitude towards AI

Variables	N	*r*-value	Significance
Teaching Effectiveness × Attitude towards AI	200	0.64	Significant at 0.01 level

The obtained r-value of 0.64 is significant at the 0.01 level.

The above table presents the relationship between teaching effectiveness and Attitude towards AI among degree college lecturers. Pearson's product-moment correlation coefficient was used to determine the direction and strength of the relationship between the two variables. The obtained correlation coefficient between teaching effectiveness and Scientific Creativity is 0.64 for a sample of 200 lecturers. The positive value of the correlation coefficient indicates that there is a positive relationship between the two variables. This means that lecturers with more favourable Attitude towards AI tend to have higher levels of teaching effectiveness. The magnitude of the *r*-value (0.64) indicates a moderately strong positive correlation between teaching effectiveness and Attitude towards AI. Since the obtained correlation is statistically significant at the 0.01 level, the relationship is considered statistically significant. Therefore, the null hypothesis stating that there is no significant relationship between teaching effectiveness and Attitude towards AI is rejected. It may be concluded that there is a significant positive relationship between teaching effectiveness and lecturers' attitudes towards Artificial Intelligence.

5. H05: There is no significant relationship between teaching effectiveness and scientific attitude.

Table 6: Correlation between Teaching Effectiveness and Scientific Attitude

Variables	N	*r*-value	Significance
Teaching Effectiveness × Scientific Attitude	200	0.61	Significant at 0.01 level

The obtained r-value of 0.61 is significant at the 0.01 level.

The above table presents the relationship between teaching effectiveness and scientific attitude among degree college lecturers. Pearson's product-moment correlation coefficient was used to determine the direction and strength of the relationship between the two variables. The obtained correlation coefficient between teaching effectiveness and scientific attitude is 0.61 for a sample of 200 lecturers. The positive value of the correlation coefficient indicates that lecturers with a more favourable scientific attitude tend to demonstrate higher levels of teaching effectiveness. The magnitude of the *r*-value (0.61) indicates a moderately strong positive relationship between teaching effectiveness and scientific attitude. Since the obtained correlation coefficient is statistically significant at the 0.01 level, the relationship is statistically significant. Therefore, the null hypothesis stating that there is no significant relationship between teaching effectiveness and scientific attitude is rejected. It may be concluded that there is a significant positive relationship between teaching effectiveness and scientific attitude among degree college lecturers. The finding suggests that lecturers possessing a strong scientific attitude—characterized by objectivity, curiosity, rational thinking, open-mindedness, critical thinking, willingness to verify evidence, and systematic problem-solving—are more likely to employ effective teaching practices. Thus, the result indicates that scientific attitude is an important correlate of teaching effectiveness among degree college lecturers. Strengthening scientific attitude among lecturers may therefore contribute to the development of innovative, evidence-based, rational, and learner-centred teaching practice

6. Conclusion:

The present study focuses on an important contemporary issue in higher education by examining the teaching effectiveness of degree college lecturers in relation to scientific creativity, attitude towards artificial intelligence, and scientific attitude. In the context of rapid technological transformation, lecturers need not only strong subject knowledge but also creativity, scientific thinking, and readiness to adopt emerging technologies. Scientific creativity can facilitate innovative approaches to teaching and problem solving, while a positive and responsible attitude towards AI can support the integration of emerging technologies into teaching, assessment, and research. Scientific attitude, meanwhile, provides a foundation for rational, objective, evidence-based, and reflective teaching practices. The study of these variables among 200 degree college lecturers in Kalaburagi District can therefore provide useful evidence for improving professional development programmes and the quality of higher education. The results obtained through *t*-test, F-test, and Pearson's *r*-test will provide an empirical basis for understanding group differences and relationships among the major variables.

IMPACT OF AI IN TEACHER EDUCATION AND PROFESSIONAL DEVELOPMENT: POSSIBILITIES AND CHALLENGES

Anto Preetham S G
Research Scholar, Dept. of Education Sahyadri Arts College, Shivamogga Kuvempu University, Shankaraghatta, Karnataka, India
Dr Manjunath H P
Professor & Research Guide, Dept. of Education Sahyadri Arts College, Shivamogga Kuvempu University, Shankaragatta, Karnataka, India

Abstract

The 21st century is a century of AI because the whole world is eagerly waiting for the upliftment of human lifestyle. At the same time, education is an integral part of human life. Then we must understand the relationship between Teacher Education and Professional Development with AI. These two terms are the two faces of one coin. Teacher Education is one of the most popular terms of the 21st century because it is directly connected with the development of the country. How much we maintain the quality of teacher education it strengthens our education system. The government has made several reforms in it. On the other hand we must adopt 'AI' in Teacher Education it is more valuable. However, professional development is the base for the teacher development. In service teacher training programmes are the integral part of professional development. Every in-service training provides the insight of the aims and objectives of programme. It is essential also.

Key words: *Artificial intelligence (AI), Teacher Education, Professional Development, In-service Teacher training programme.*

Introduction:

Artificial intelligence (AI) is more of a broader term because it is used in every sector. Especially in education, it is being used effectively. The advancement was done in Education through the educational technology. AI technologies in schools can support more time for student engagement and learning experiences. The smart classroom is an integral part of using AI in education, and it supports students' skill development for future work. Smart campus operations can harness AI to boost student engagement and introduce new types of content and operations. AI gives more confidence and inspiration to both teachers and students. For better learning outcomes in education, we must use AI systematically. The use of educational technology in schools is becoming more mainstream. AI can take many shapes and forms in education. Incorporating intelligent AI technology into schools can also help teachers, staff and administrators by automating repetitive or time- consuming tasks, freeing time to focus on enabling student success.

During this digital age, Artificial Intelligence has emerged as a transformative force, which revolutionises all sectors of human life. The advancement in teacher education and professional development is a major requirement of the modern age. The traditional method of teaching lacks new inventions. But the modern method of teaching is the best option of

uplifting the educational system of the country. Education is a major resource of human beings. The ultimate aim of education is the modification of behaviour and cultivation of mind. The whole county needs a change in every sector; among them education is one. In that way we can adopt those new methods in teaching, and it is need for the hour.

Methodology:

The paper is exploratory in nature and the information is gathered by reviewing various article intelligence (AI) drawn from articles available on journals, magazines and other internet resources. In all the paper is based on secondary sources of information.

Objectives:

The objectives of this study as follows;

1. To assess the role of artificial intelligence on professional development and teacher education.
2. To explore the changes in the Education sector after implementing AI.
3. To compare modern day teaching with ancient method of teaching.

Review of literature:

1. Khairul Jamaludin (2026) "the role of AI in Higher Education, teacher training, and professional development: Teachers' perspective". The study aimed to evaluate the role of AI in higher education, teacher training and professional development from the teachers' perspective.
2. James Gordon "Teacher Professional Formation in the Age of AI". This paper examines how artificial intelligence (AI), especially large language models (LLMs), is reshaping the way new teachers engage in professional formation during their initial teacher education (ITE) and early workplace experiences.

AI's role in teacher Education and professional development:

At first Teacher training programs depend upon in-person seminars workshops and classroom practice which generally lack personalized approach. With the help of AI these limitations can be solved. Some important roles of AI for teacher Education professional development are discussed below:

- **AI provide personalized teacher Education**:

AI provides personalized teacher training programs by analyzing their strengths and weakness. Ai can collect data related to a teacher's progress and provide guidance regarding improvement in the area as per need of the teacher. With the help of AI teachers can access modules, courses according to their pace and style and also received feedback.

- **Virtual simulation and AI chatbots**:

the creation of virtual classroom enabled by AI technology and it helps teachers to practice lessons with simulated students. By these AI technology and it helps teachers to practice lessons with simulated students. By these AI driven simulations, teachers can refine their teaching techniques and also familiarize with various classroom situations which help them in their teaching task with real students. Moreover, AI chatbots provide on demand support to teachers by answering questions and offering professional development courses.

- **AI and Continuous Professional Development:**

previously teacher professional development depended upon formal workshops and seminars

which might not happen regularly. But now through virtual workshops, online learning and assessment platforms, AI provides opportunity for continuous professional development to teachers. AI driven tools help teachers in continually upgrading their knowledge and skills by providing them immediate feedback, assessment and suggestions for further development. These platforms updated teachers with the latest educational trends, technologies and pedagogies.

- **AI in classroom management and pedagogical improvement:**

AI provides data driven insights into student performance, their behavior, and learning patterns. With the help of AI tools, teachers can identify students who need extra attention or different pedagogical approaches. By this data driven analysis teacher can adjust their teaching strategies to enhance learning outcomes, which is a key objective of NEP 2020. Additionally, AI helps teachers in integrating advanced pedagogical tools like adaptive learning systems which assist students in their progress and also teachers can manage diverse needs of students in their classrooms.

- **AI and Inclusion and Diversity**:

AI helps to make an environment that accommodates all students irrespective of their background, making it possible that no child is left behind. AI related tools empower teachers in creating a more inclusive learning environment as it helps teachers in recognizing the specific learning needs of students as well as children with special needs or learning disabilities. AI provides differential teaching methods, strategies to cater the needs of the students.

- **AI provide Real time data and feedback for improvement:**

AI works on it as it provides data related to students' engagement, performance and progress. Also guide teachers in delivery of their lesson and students' participation during teaching session. Teachers can receive immediate feedback and accordingly make necessary adjustments.

- **AI and Bridging the gap in remote and underserved areas:**

Lack of resources and infrastructure, especially in rural and remote areas is a noteworthy challenge in teacher training programs in India. AI platforms provide solutions to this challenge by offering remote access to high quality teacher training programs. Noe there is no need to travel long distances to attend training sessions but they can access from anywhere and anytime as per their own convenience.

- **Improving Emotional intelligence:**

AI can assist teachers in developing emotional intelligence, which is critical for creating positive classroom environments. AI applications can help teachers reflect on their interactions with students and provide suggetions for improving classroom management. For instance, AI can analyse the tone of voice, body language, and overall classroom sentiment, offering recommendations for strengthening relationships with students and improving overall enagement.

- **Administrative support and AI:**

By automating many administrative tasks AI helps teachers in their administrative tasks AI helps teachers in their administrative work. Teachers are overburdened by time-scheduling,

attendance and grading tasks and AI tools assist them by alleviating this burden so that teachers can devote more time and attention to teaching and professional development.

- **Improves Efficiency**:

AI improves efficiency of teachers by assisting them in planning, assigning tasks and supervision of learner's activities. AI makes teaching learning tasks easier and also minimizes paperwork among teachers.

- **AI and collaborative teacher network**:

Through virtual network, educators across countries collaborate with each other, discuss their strategies with one another, share their ideas and resources. And thus, engage in a collective problem solving approach, solving each other's matters and help in their professional development through peer to peer interaction and mutual support.

- **AI tools for Teacher Training and Professional Development**:

In India, Teacher training and Professional development programs are progressively transforming by Artificial Intelligence.

- **Initiatives by National Council of Educational Research and Training (NCERT):**

NCERT also takes an initiative to provide educators hands-on experience regarding AI tools. CIET under NCERT conducts training programs in order to enhance skills of teachers to utilize AI tools effectively in the teaching learning process.

- **Generative AI:**

"Generative AI for educators" is free and self- paced course which is by Google in collaboration with MIT RAISE. This two-hour course is designed for middle and high school teachers. After completion educators received certificates which helped them in professional development. This course provides Practicle applications of AI to help in personalizing instruction, save time and enhance lesson creativity.

- **Brisk Teaching's AI tools**:

this is free AI tools for educators which include AI lesson plan generator and students' instant feedback mechanisms, which help teachers in enhancing efficiency in their routine activity and increasing effectiveness in the classroom teaching learning process.

- **OpenAI Training course**:

This course provides free training in Artificial Intelligence and prompt Engineering. OpenAI works in partnership with Common Sense Media. This course helps teachers in how to use ChatGPT in their teaching learning process, how to create lesson contents and organize other administrative tasks in a better way.

- **India AI Portal:**

This National AI portal was launched by the Government of India, which offers a repository of AI-related resources, including articles, news, research papers and educational resources. This portal helps educators to access AI tools and remain updated on the latest developments of the Indian education system by integrating AI.

- **Canva**:

Canva is an online Graphic design platform which provides templates, fonts, photos, and design elements for creation of professional design. It is a user- friendly drag and drop interface which assists in creation of presentation, posters, for resume, brochures, social media

graphics and many more.

These are all AI tools and platforms contribute to the teacher education and training course and also on professional development in India on a large scale.

Challenges and the way forward: Discussion and Suggestions

Although the role of Artificial Intelligence in Teacher training and professional development is crucial but several challenges must be considered:

- **Cost and Accessibility to technology:**

AI based teacher training tools need high quality devices and internet connectivity but due to digital divide, in rural and underserved areas access to technology is limited. There is an urgent need for high-speed internet connectivity, infrastructure, and availability of low-cost devices. Therefore, there is a requirement of policies and initiatives by Government and stakeholders to address these issues.

- **Data security and Privacy:**

AI tools and platforms require data related to students' performance, their behavior pattern, educational outcomes, biometric information of teachers-students. These are very sensitive data which need to be protected and prevented from misuse. It is important to implement data protection measures to safeguard privacy. Therefore, there must be clear ethical guidelines established to direct the use of AI in education.

- **Balance between AI and Human Connection:**

AI can enhance professional development but it cannot provide emotional support, mentorship or peer interaction which is crucial for growth of teachers and students. AI cannot replicate completely. The human element of teaching remains irreplaceable. Therefore, there must be a balance between leveraging technology and human connection for teacher growth.

- **Teacher training to use AI efficiently:**

Teachers must be trained to use AI tools effectively and efficiently. For this there must be integration of AI into teachers training programs and ensure that teachers must be comfortable with new technologies.

- **Dependence on Technology**:

In the current scenario there is a concern that teachers and students might become heavily dependent upon technology that is on AI tools and platforms for answers and solutions of their educational queries. It could lead to decline in critical analysis and problem- solving abilities of students. Moreover, technology has limitations also and it could hinder learning experiences. It is utmost important that AI assist to enhance not to replace the conventional teaching methods.

- **Quality and Relevance of content**:

The quality of the content available on AI platforms is another significant challenge that needs to be addressed. There is important questions that AI content and educational materials are correct, up-to-date and relevant to the curriculum.

Educational Implications:

- Teacher training programmes should integrate AI literacy and digital pedagogy.
- Institutions should provide continuous professional development on ethical AI use.
- Policymakers should ensure equitable access to AI-based training resources.

- Teacher educators should emphasise human- centred and reflective AI integration.

Conclusion

AI is reshaping teacher training and professional development by offering personalized, data-driven solutions that empower educators to enhance their teaching practices continuously. From real time feedback to virtual simulations, AI has the potential to improve both the efficiency and effectiveness of teacher development.

A STUDY OF ACADEMIC ACHIEVEMENT AND ACHIEVEMENT MOTIVATION OF 10th STANDARD STUDENTS

Dr. Haleshappa T.
Assistant Professor, M.M College of Education, haleshmmclg@gmail.com

Abstract

The present study used to find out the important relationship between academic achievement and achievement motivation of 10th standard students. Achievement motivation refers to the specific needs for identifying these phenomena. Achievement motivation and academic achievement as a natural and inevitable essential outcome of 10th standard students' growth and development. In this study to find out the relationship of the achievement motivation with Academic Achievement of 10th standard students. It was concluded from the study that achievement motivation was strongly and positively correlated and significant. It can be concluded based on the findings of this study that students of rural showed higher achievement motivation as compared to students of urban. Here achievement motivation Scale and Academic Achievement scores used. The results differences in achievement motivation and academic achievement of 10th standard students between rural and urban concluded in this study.

Key words; *Achievement motivation. Academic Achievement, Secondary school, variables, hypothesis, Objectives. Statistical Techniques. 10th standard students.*

Introduction

One aspect of this theory is that individuals are motivated to either avoid failure or achieve success. In the former situation, the individual is more likely to select easy or difficult tasks, thereby either achieving success or having a good excuse for why failure occurred. In the latter situation, the individual is more likely to select moderately difficult tasks which will provide an interesting challenge, but still keep the high expectations for success.

Concept of Academic Achievement

Achievement refers to the scholastic or academic achievement of the student at the end of an educational programmed. Academic performance according to the Cambridge University Reporter (2003) is frequently defined in terms of examination performance. Academic achievement refers to what the students have learned what skills the students have learned and is usually measured through assessments like standardized tests, performance assessments and portfolio assessments (Santrock 2006). The descriptive assessment information will usually be translated through grading system such as Grade Point Average (GPA) and course grade. The study will make use of Cumulated Grade Point Average (CGPA) since it provides information of the students' academic performance across time.

Academic achievement performance, which is measured by the examination results, is one of the major goals of a school. Hayle (1986) argued that schools are established with the aim of imparting knowledge and skills to those who go through them and behind all this is the idea of enhancing good academic performance

Concept of Achievement motivation

Achievement motivation is the internal psychological drive that compels an individual to pursue success, set high standards of excellence, and persist through challenges Achievement is undoubtedly the most thoroughly studied motive. It was first identified in Henry A. Murray's list of "psychogenic" needs as "n(eed) Achievement," and described in the following terms: To accomplish something difficult. To master, manipulate or organize physical objects, human beings, or ideas. To do this as rapidly and as independently as possible

Achievement motivation refers the internal motivation that gives people the drive to work towards success, cope with obstacles, and reach high levels of excellence (Bronstein & Heckhausen, 2018). Classical theories of achievement motivation imply that people with higher achievement motivation levels are associated with the choice of moderately challenging tasks, favorable work conditions in which clear feedback is obtained, and greater persistence when confronted with challenges (Elliot & McGregor, 2001).

The Problem

The present investigation is titled as: "**A Study of Achievement Motivation and Academic Achievement of 10th standard students".**

Objectives of the Study

1. To study the difference between 10th standard students of low and high achievement motivation with respect to academic achievement.
2. To study the interaction effect of gender (Boys and Girls) and achievement motivation (Low and high) on academic achievement of 10th standard students.

Significance of the Study

The specific needs for identifying these phenomena of achievement motivation and academic achievement as a natural and inevitable essential outcome of 10th standard students growth and development rather than among pathological symptom. The achievement motivation and academic achievement becomes important in the student life of individual 10th standard students. As the students are the pillars of the future generations their value pattern of achievement motivation and academic achievement are vital. So the present study intends to measure the achievement motivation and academic achievement of 10th standard students

Variable of the Study : In the present study the following variables were considered:

- Achievement Motivation
- Academic Achievement of students

Hypotheses of the Study

Hypothesis: There is no significant difference between 10th standard students of low and high achievement motivation with respect to academic achievement.

Hypothesis: There is no significant interaction effect of gender (Boys and Girls) and achievement motivation (Low and High) on academic achievement of 10th standard students

Research Tools Used

The following tool has been employed for collecting data for the present study.

- Achievement Motivation Scale
- Academic Achievement Score

Population and Sample

The sample of the present study consists of 600 10th standard students. The required sample was selected using stratified random sampling technique. 600 students were different secondary schools were drawn for the present investigation.

Data Collection

The investigator was collected the data from 600 10th standard students of Davanagere district. The investigator has requested the Headmasters of schools and personally administered the tool to the students. Clear-cut instruction was given to fill up the responses to the items in the tools. The collected data was systematically pooled for analyses.

Statistical Techniques

For the analysis of data collected, differential analysis, such as mean, standard deviation, ANOVA, t-test, analysis was used.

Data Analyses

Table-1: Results of t-test between 10th standard students of Low and High Achievement Motivation with Respect to Academic Achievement

Achievement motivation	Mean	SD	SE	t-value	p-value	Signi.
Low achievement motivation	358.85	59.30	3.47	-32.6897	0.0001	<0.05, S
High achievement motivation	518.45	44.56	2.80			

From the results of the above table, it can be seen that, a significant difference is observed between 10th standard students of low and high achievement motivation respect to academic achievement (t=-32.6897, p<0.05) at 0.05 level of significance. Hence, the null hypothesis is rejected and alternative hypothesis is accepted. It means that, the secondary school students with high achievement motivation have significantly smaller academic achievement as compared to 10th standard students with low achievement motivation.

Table-2: Pair-wise Comparison of Interaction Effects of Gender (Boys and Girls) and Achievement Motivation (Low and High) on Academic Achievement of 10th standard students by Tukeys Multiple Posthoc Procedures

Interactions	Boys with low AM	Boys with high AM	Girls with low AM	Girls with high AM
Mean	365.79	503.27	363.49	511.78
SD	62.72	41.60	58.90	46.95
Boys with low AM	-			
Boys with high AM	p=0.0001*	-		
Girls with low AM	p=0.2000	p=0.0001*	-	
Girls with high AM	p=0.0001*	p=0.6941	p=0.0001*	-

*p<0.05

From the results of the above table, it clearly showed that,

- The secondary school boy students with low achievement motivation and 10th standard boy students with high achievement motivation differ significantly with respect to

academic achievement at 0.05 level of significance. It means that, the 10th standard boy students with high achievement motivation have higher academic achievement as compared to the 10th standard boy students with low achievement motivation.

- The 10th standard boy students with low achievement motivation and 10th standard girl students with high achievement motivation do not differ significantly with respect to academic achievement at 0.05 level of significance. It means that, the 10th standard boy students with low achievement motivation and 10th standard girl students with high achievement motivation have similar academic achievement.
- The 10th standard boy students with low achievement motivation and 10th standard girl students with high achievement motivation differ significantly with respect to academic achievement at 0.05 level of significance. It means that, the 10th standard girl students with high achievement motivation have higher academic achievement as compared to the 10th standard boy students with low achievement motivation.
- The 10th standard boy students with high achievement motivation and 10th standard girl students with low achievement motivation differ significantly with respect to academic achievement at 0.05 level of significance. It means that, the 10th standard boy students with high achievement motivation have higher academic achievement as compared to the 10th standard girl students with low achievement motivation.
- The 10th standard boy students with high achievement motivation and 10th standard girl students with high achievement motivation do not differ significantly with respect to academic achievement at 0.05 level of significance. It means that, the 10th standard boy students with high achievement motivation and 10th standard girl students with high achievement motivation have similar academic achievement.
- The 10th standard girl students with low achievement motivation and socially secondary school girl students with low achievement motivation differ significantly with respect to academic achievement at 0.05 level of significance. It means that, the 10th standard girl students with high achievement motivation have higher academic achievement as compared to the 10th standard girl students with low achievement motivation.

Findings of the Study

- The 10th standard students with high achievement motivation have significantly smaller academic achievement as compared to 10th standard with low achievement motivation.
- The 10th standard boy students with high achievement motivation have higher academic achievement as compared to the 10th standard boy students with low achievement motivation.
- The 10th standard boy students with low achievement motivation and 10th standard girl students with high achievement motivation have similar academic achievement.
- The 10th standard girl students with high achievement motivation have higher academic achievement as compared to the 10th standard boy students with low achievement motivation.

- The 10th standard boy students with high achievement motivation have higher academic achievement as compared to the 10th standard girl students with low achievement motivation.
- The 10th standard boy students with high achievement motivation and 10th standard girl students with high achievement motivation have similar academic achievement.
- The 10th standard girl students with high achievement motivation have higher academic achievement as compared to the 10th standard girl students with low achievement motivation.

Implications of the Study

On the basis of findings of the study and the observations made by the investigator during the study, a few recommendations which may help in developing suitable programmes to improve achievement motivation in relation to academic achievement of children of 10th standard have been offered.

1. It is observed that the achievement motivation is an important factor in academic achievement of 10th standard to improve their social background by encouraging them in school context to achieve more goals in the society. It is necessary to admit the 10th standard to boost their achievement motivation.
2. The study reveals that the 10th standard girl students with high achievement motivation differ with the 10th standard boy students with low achievement motivation and the girls students are higher academic achievement. Hence it can be concluded that the 10th standard boy students are study hard and try to meet their goals in improving their academic performance and to think more towards achievement motivation and academic achievement.

Conclusion

The 10th standard students with high achievement motivation have smaller academic achievement as compared to 10th standard students with low achievement motivation.

The 10th standard boys and girls are similar in their achievement motivation and girl students with high achievement motivation have higher academic achievement when compared to 10th standard boy students also 10th standard boy students with high achievement motivation have higher academic achievement as compared to the 10th standard girl students with low achievement motivation.

The 10th standard boys and girl students need orientation to support proper direction towards achievement motivation and better academic achievement.

ARTIFICIAL INTELLIGENCE USAGE FOR PROMOTING SUSTAINABLE DEVELOPMENT AMONG COLLEGE STUDENTS

M.Yamuna,
Ph.D. Research Scholar, Department of Educational Psychology, Tamil Nadu Teachers Education University, Chennai-600097.Email: yamunagouma@gmail.com
Dr. T. Sivasakthi Rajammal,
Research Supervisor, Assistant Professor & Head, Department of Educational Psychology, Tamil Nadu Teachers Education University, Chennai-600097.Email: sivasakthigopal2647@gmail.com

Abstract

Artificial Intelligence (AI) has emerged as one of the most influential technological developments of the twenty-first century and is increasingly being applied to address complex social, economic, and environmental challenges. In the context of higher education, college students are among the major users of AI-enabled technologies, including generative AI tools, intelligent learning platforms, data analysis applications, virtual assistants, and recommendation systems. These technologies have the potential to support sustainable development by improving access to knowledge, promoting efficient use of resources, encouraging innovation, and helping individuals understand and address sustainability-related challenges. However, the extent to which college students use AI for purposes that contribute to sustainable development remains an important area for investigation. The present study examines Artificial Intelligence usage for promoting sustainable development among college students. The study adopts a descriptive survey method. A sample of 150 college students was selected using an appropriate sampling technique. Data were collected using a structured tool designed to assess students' usage of AI in relation to sustainable development. The study focuses on major dimensions such as academic and learning-related AI usage, environmental sustainability, social responsibility, innovation and problem-solving, and responsible and ethical use of AI. The formulated hypotheses and objectives were tested using appropriate statistical technique t-test and F-Test. The study is significant because higher education institutions play an important role in preparing young people to respond to contemporary global challenges. Understanding how students use AI can help educators and policymakers develop appropriate strategies for integrating AI with sustainability education. The study is expected to contribute to the growing body of knowledge on AI and sustainable development by highlighting the potential of responsible and purposeful AI usage among college students. The findings may support the development of educational programmes that promote digital competence, innovation, ethical awareness, and sustainable thinking among the younger generation.

Keywords: *Artificial Intelligence, AI Usage, Sustainable Development, College Students, Higher Education, Digital Competence*

1. Introduction

Artificial Intelligence (AI) has become an important part of contemporary society. Its applications are increasingly visible in education, healthcare, business, transportation, agriculture, communication, environmental management, and public administration. AI refers broadly to technologies and systems capable of performing tasks that are generally associated with human intelligence, such as learning, reasoning, problem-solving, decision-making,

language processing, and pattern recognition. Recent developments in generative AI and other intelligent technologies have made AI more accessible to students and educators than ever before. Higher education is experiencing significant changes because of the rapid growth of AI-enabled technologies. College students increasingly use AI applications for searching for information, generating ideas, improving writing, analysing data, solving academic problems, developing creative projects, and supporting independent learning. AI can provide personalised learning experiences and enable students to access information and educational support more efficiently. As AI becomes a regular part of students' academic and everyday lives, it is important to understand not only whether students use AI but also the purposes for which they use it. At the same time, the world is facing several major sustainability challenges. Climate change, environmental degradation, poverty, inequality, resource depletion, and social exclusion require innovative and collaborative solutions. Sustainable development emphasises the need to meet present needs while protecting the ability of future generations to meet their own needs. The Sustainable Development Goals (SDGs) provide a global framework for addressing these interconnected challenges.

Artificial Intelligence has the potential to contribute to sustainable development in several ways. AI can support the analysis of large volumes of information, improve decision-making, optimise the use of resources, predict environmental changes, and assist in the development of innovative solutions. AI-based systems can contribute to energy management, smart agriculture, environmental monitoring, healthcare delivery, disaster management, and educational accessibility. However, the relationship between AI and sustainability is not automatically positive. AI technologies may also create challenges related to energy consumption, electronic waste, algorithmic bias, privacy, misinformation, inequality, and unethical use.

Therefore, the responsible use of AI is essential. College students represent an important group in this context because they are future professionals, researchers, educators, administrators, entrepreneurs, and citizens. Their present understanding and usage of AI may influence how these technologies are used in society in the future. Students who are able to use AI critically, creatively, ethically, and responsibly may be better prepared to contribute to sustainable development. The present study, therefore, focuses on Artificial Intelligence Usage for Promoting Sustainable Development among College Students. The study seeks to understand how AI is being used by college students and how such usage may contribute to sustainable thinking, learning, innovation, and problem-solving.

2. Need of the Study

Artificial Intelligence (AI) is increasingly becoming an important part of higher education and offers new opportunities to address social, economic, and environmental challenges related to sustainable development. College students, as future professionals and responsible citizens, need to develop the knowledge and skills to use AI effectively and responsibly. Although AI tools are widely used for learning and academic purposes, there is a need to understand how college students use AI to promote sustainable development. Therefore, the present study was undertaken to examine Artificial Intelligence Usage for Promoting Sustainable Development among College Students and to understand whether selected demographic variables influence

their usage.

3. Review of Related Literature

Kasneci et al. (2023) discussed the opportunities and challenges associated with large language models in education. The authors observed that AI technologies can support learning and educational innovation but may also create concerns regarding academic integrity, bias, misinformation, and overdependence on automated systems. Their work highlights the importance of developing AI literacy among learners.

Tlili et al. (2023) examined the emergence of generative AI in education and discussed both its educational potential and the challenges associated with its rapid adoption. The study suggested that AI can support creativity, personalised learning, and access to information when used responsibly.

Vinuesa et al. (2020) demonstrated that AI can contribute to achieving several Sustainable Development Goals through applications in areas such as health, education, energy, environmental protection, and economic development. At the same time, the researchers noted that AI may negatively affect some sustainability targets if it is developed and used without appropriate governance.

4. Objectives of the Study

The present study has the following objectives:

- To determine the level of Artificial Intelligence usage for promoting sustainable development among college students.
- To find out whether there is any significant difference in Artificial Intelligence usage for promoting sustainable development among college students in respect to their
    - Gender
    - Locality
    - Types of Management

5. Hypotheses of the Study

The following null hypotheses are formulated for the study:

- There is no significant difference between (Gender) male and female College Students with respect to their Artificial Intelligence Usage for Promoting Sustainable Development.
- There is no significant difference between rural and urban (Locality) College Students with respect to their Artificial Intelligence Usage for Promoting Sustainable Development.
- There is no significant difference among type of management (government / government-aided / private) College Students with respect to their Artificial Intelligence Usage for Promoting Sustainable Development.

6. Methodology:

The investigator adopted the survey method of study and selected the stratified random sampling technique. 150 college students were randomly selected from various colleges belongs to government, government-aided and self-financed management. Data were collected using a structured tool designed to assess students' usage of AI in relation to sustainable development. A Personal Data Sheet was also created by the investigator. The formulated

hypotheses and objectives were tested using appropriate statistical technique t-test and F-Test Analysis of Variance (ANOVA).

7. Testing of Hypothesis:

Hypothesis – 1

There is no significant difference between (Gender) male and female College Students with respect to their Artificial Intelligence Usage for Promoting Sustainable Development.

Table 1

Details of t-Test Result for Gender

Variables	Gender	N	Mean	SD	t-Value	LOS
Artificial Intelligence Usage for Promoting Sustainable Development	Male	22	114.82	17.46	0.239	Not Significant
	Female	128	114.98	13.58		

As seen in Table 1, the average score for Men (N= 22) is 114.82 with SD of 17.46 and the mean score for women (N = 128) is 114.98 with SD of 13.58. Based on these findings (t = 0.239 < 1.96), the artificial intelligence usage for promoting sustainable development does not discernible differs between male and female college students based on gender. It can be concluded that null hypothesis 1 is accepted.

Hypothesis – 2

There is no significant difference between rural and urban (Locality) College Students with respect to their Artificial Intelligence Usage for Promoting Sustainable Development.

Table 2

Details of t-Test Result for Locality

Variables	Locality	N	Mean	SD	t-Value	LOS
Artificial Intelligence Usage for Promoting Sustainable Development	Rural	22	49.92	10.26	0.198	Not Significant
	Urban	128	50.05	9.76		

As shown in the Table 2, the mean score for Rural (N= 22) is 49.92 with SD of 10.26 and the mean score for Urban (N=128) is 50.05 with SD of 9.76. Based on these findings (t = 0.198 < 1.96), the Artificial Intelligence Usage for Promoting Sustainable Development does not discernible differs between rural and urban college students based on locality. It can be concluded that null hypothesis 2 is accepted.

Hypothesis – 3

There is no significant difference among type of management (government / government-aided / private) College Students with respect to their Artificial Intelligence Usage for Promoting Sustainable Development.

Table 5						
Details of F-ratio Result for Type of Management						
Variables	**Nature**	**Sum of Squares**	**Df**	**Mean Square**	**F-ratio**	**LOS**
Artificial Intelligence Usage for Promoting Sustainable Development	Between Groups	1469.93	2	325.06	1.092	**Not Significant**
	With in Groups	25216.71	147	103.95		
	Total	26685.64	149			
	Total	**Nature**	**Sum of Squares**	**3.859**		

As shown in Table 3, the obtained value for F is 1.092; At the F- results (1.092) is less than the table value (3.84). Artificial Intelligence Usage for Promoting Sustainable Development does not discernible differs between government, government aided and private college students based on Management Types. It can be concluded that null hypothesis 3 is accepted.

8. Major Findings of the study

The major findings of the study are as follows:

- There is no significant difference between male and female college students in their Artificial Intelligence Usage for Promoting Sustainable Development. The mean scores of male students (114.82) and female students (114.98) were almost similar, and the obtained t-value (0.239) was not significant.
- There is no significant difference between rural and urban college students in their Artificial Intelligence Usage for Promoting Sustainable Development. The obtained t-value (0.198) was not significant, indicating that locality did not influence the students' AI usage for promoting sustainable development.
- There is no significant difference among government, government-aided, and private college students in their Artificial Intelligence Usage for Promoting Sustainable Development. The obtained F-value (1.092) was not significant, indicating that the type of management did not significantly influence AI usage for promoting sustainable development.

9. Discussion of the results

Overall, the results suggest that Artificial Intelligence Usage for Promoting Sustainable Development is becoming increasingly common among college students, irrespective of their gender, locality, or type of institutional management.

10. Educational Implications:

The findings of the study may have several important implications for higher education.

- First, higher education institutions can integrate AI literacy with sustainability education. Students should not only learn how to operate AI tools but also understand how AI can be applied to solve environmental, social, and economic problems.

- Second, educators can design learning activities that encourage students to use AI for addressing real-world sustainability challenges. Project-based learning, problem-solving activities, data analysis, and community-based projects can help students apply AI meaningfully.
- Third, institutions should promote responsible and ethical AI usage. Students require guidance regarding academic integrity, privacy, misinformation, algorithmic bias, intellectual responsibility, and the environmental consequences of digital technologies.
- Fourth, teacher education and professional development programmes can prepare educators to integrate AI and sustainability into teaching and learning. Teachers play a significant role in guiding students towards responsible and purposeful technology use.
- Fifth, policymakers and educational administrators can use the findings to develop guidelines and programmes for responsible AI integration in higher education. Such initiatives can support the development of students as informed, innovative, and socially responsible citizens.
- Finally, the study may encourage further research on the relationship between AI competence, sustainability awareness, innovation, problem-solving, and responsible digital citizenship.

11. Conclusion: The study concludes that college students demonstrate a similar level of Artificial Intelligence usage for promoting sustainable development, irrespective of their gender, locality, and type of institutional management. The findings indicate that these demographic factors do not significantly influence students' use of AI for sustainability-related purposes. The increasing accessibility of AI tools and digital technologies may have provided students with relatively equal opportunities to use AI for learning, problem-solving, innovation, and sustainable development. Therefore, higher education institutions should encourage the responsible and effective use of Artificial Intelligence to develop students' knowledge, skills, and awareness towards promoting sustainable development.

A STUDY ON ADJUSTMENT ABILITIES OF UNDERGRADUATE STUDENTS OF KALABURAGI DISTRICT IN RELATION TO THEIR INTELLIGENCE AND INTEREST

Sandeepkumar Namadev
Research Scholar, Dept of studies and Research in education, Gulbarga University, Kalburgi
Prof. Hoovinbhavi B L
Research Guide, Professor and Dean, Dept of studies and Research in education
Gulbarga University, Kalburgi

Abstract

The present study was undertaken to investigate the adjustment abilities of undergraduate students of Kalaburagi District in relation to their intelligence and interest. Adjustment is an important psychological process that enables students to deal effectively with academic, social, emotional and personal demands. Intelligence may facilitate effective problem-solving and decision-making, while interest influences students' involvement, motivation and adaptation to different activities. The study adopted a descriptive survey research design. A sample of 400 undergraduate students was selected from different colleges of Kalaburagi District by using an appropriate sampling procedure. Gender and locale were considered as demographic variables. Adjustment ability was treated as the dependent variable, whereas intelligence and interest were considered independent variables. Data were proposed to be analysed using mean, standard deviation, t-test, correlation coefficient (r-test) and multiple regression analysis. The study is expected to provide useful information to teachers, counsellors, teacher educators and college administrators for developing suitable programmes to improve students' adjustment abilities.

Keywords: *Adjustment Ability, Intelligence, Interest, Undergraduate Students, Gender, Locale, Kalaburagi District, Correlation, Regression.*

1. Introduction:

Higher education is an important stage in the development of young people. Undergraduate students experience several changes in their academic, social, emotional and personal lives. They are expected to adapt themselves to new learning environments, relationships, responsibilities, academic expectations and future career demands. The ability to adjust successfully is therefore an important determinant of students' academic progress and overall well-being.

Adjustment refers to the process through which an individual modifies his or her behaviour, attitudes and responses to maintain a satisfactory relationship with the environment. A well-adjusted student is generally able to manage academic responsibilities, establish healthy interpersonal relationships, regulate emotions and deal with everyday challenges effectively. Poor adjustment may result in academic difficulties, interpersonal problems, dissatisfaction and lack of motivation.

Intelligence is another important psychological variable associated with

adjustment. Intelligent individuals may be better able to understand situations, analyse problems, select appropriate alternatives and adapt their behaviour according to environmental requirements. However, adjustment is not determined by intelligence alone. Students' interests, motivation and involvement in academic and social activities may also influence their ability to adapt.

Interest refers to a person's relatively enduring inclination or preference towards particular activities, subjects, ideas or experiences. Students who possess appropriate interests may demonstrate greater attention, motivation and involvement in educational activities. Such involvement may contribute to better academic and social adjustment.

Kalaburagi District has a diverse undergraduate student population studying in government, aided and private institutions located in urban and rural areas. Differences in educational environment and socio-cultural conditions may influence students' adjustment. Hence, there is a need to examine the adjustment abilities of undergraduate students and determine the extent to which intelligence and interest are associated with adjustment.

The present study therefore focuses on the adjustment abilities of undergraduate students of Kalaburagi District in relation to their intelligence and interest, with gender and locale as demographic variables.

2. Need and Significance of the Study:

Undergraduate students are passing through a critical period of personal and educational development. Their ability to adjust to college life has implications for academic achievement, interpersonal relationships and future professional development. Understanding the factors associated with adjustment can help educational institutions provide appropriate guidance and counselling.

The present study is significant for the following reasons:

1. It helps to understand the level of adjustment abilities among undergraduate students.
2. It examines whether adjustment differs according to gender.
3. It examines whether adjustment differs according to locale.
4. It determines the relationship between intelligence and adjustment.
5. It determines the relationship between interest and adjustment.
6. It identifies the predictive contribution of intelligence and interest to adjustment.
7. The findings may help teachers and counsellors identify students requiring additional guidance.
8. The study may provide a basis for developing counselling and student-support programmes in undergraduate colleges.

3. Statement of the Problem:

"A STUDY ON ADJUSTMENT ABILITIES OF UNDERGRADUATE STUDENTS OF KALABURAGI DISTRICT IN RELATION TO THEIR INTELLIGENCE AND INTEREST."

4. Objectives of the Study:

The study was undertaken with the following objectives:

1. To study the adjustment abilities of undergraduate students of Kalaburagi District.

2. To find out whether there is a significant difference in adjustment abilities of undergraduate students with respect to gender.
3. To find out whether there is a significant difference in adjustment abilities of undergraduate students with respect to locale.
4. To find out the relationship between intelligence and adjustment abilities of undergraduate students.
5. To find out the relationship between interest and adjustment abilities of undergraduate students.
6. To determine the predictive contribution of intelligence and interest towards adjustment abilities of undergraduate students.

5. Hypotheses of the Study:

The following null hypotheses were formulated:

1) **H_o1:** There is no significant difference in the adjustment abilities of undergraduate students with respect to gender.
2) **H_o2:** There is no significant difference in the adjustment abilities of undergraduate students with respect to locale.
3) **H_o3:** There is no significant relationship between intelligence and adjustment abilities of undergraduate students.
4) **H_o4:** There is no significant relationship between interest and adjustment abilities of undergraduate students.
5) **H_o5:** Intelligence and interest do not significantly predict the adjustment abilities of undergraduate students.

6. Variables of the Study:

1) Dependent Variable: Adjustment abilities
2) Independent Variables: Intelligence and Interest
3) Demographic Variables: Gender and Locale

7. Operational Definitions of Key Terms:

1) **Adjustment Abilities:** Adjustment abilities refer to the capacity of undergraduate students to adapt effectively to academic, emotional, social and personal demands and maintain a satisfactory relationship with their environment.
2) **Intelligence:** Intelligence refers to the general mental ability of an undergraduate student to understand, reason, learn, solve problems and adapt effectively to different situations, as measured by the selected intelligence test.
3) **Interest:** Interest refers to the degree of preference, attraction and involvement of undergraduate students towards educational and other relevant activities, as measured by the selected interest inventory.
4) **Undergraduate Students:** Undergraduate students refer to students pursuing degree-level education in colleges of Kalaburagi District.

8. Research Method:

8.1. Method of the study:

The descriptive survey method was adopted for the present investigation. The method was considered appropriate because the study aimed to determine the existing level of adjustment

abilities and examine their relationship with intelligence and interest among undergraduate students.

8.2. **Population and Sample:**The population of the study consisted of undergraduate students studying in degree colleges of Kalaburagi District. A sample of 400 undergraduate students was selected for the study. The sample included students from both genders and from urban and rural locales. The sample may be selected from different undergraduate colleges representing the urban and rural areas of Kalaburagi District.

8.3. Tools Used for Data Collection:

The following tools may be used for collecting the required data:

Variable	Tool Name	Author And Year
Adjustment Abilities	Adjustment Inventory	Dr. R K Ojha
Intelligence	Test Of General Intelligence	S. K. Pal And K. S. Mishra
Interest	Multiphasic Interest Inventory	Dr. (Mrs.) S. K. Bawa (Bhatinda)

8.4. **Procedure for Data Collection:** The investigator obtained permission from the concerned college authorities before collecting the data. The purpose of the study was explained to the students. Necessary instructions were provided before administering the tools. The adjustment scale, intelligence test and interest inventory were administered systematically. The responses were collected, scored according to the respective manuals and entered into a data sheet for statistical analysis.

8.5. **Statistical Techniques Used:** The following statistical techniques were proposed for analysing the data:

1. **Mean and Standard Deviation** – to understand the general level and variability of scores.
2. **t-test** – to determine differences in adjustment abilities with respect to gender and locale.
3. **Pearson's Product-Moment Correlation (r)** – to determine the relationship between:

1) Intelligence and adjustment
2) Interest and adjustment

4. **Multiple Regression Analysis** – to determine the predictive contribution of intelligence and interest towards adjustment abilities.

The level of significance may be fixed at **0.05**.

9. Analysis and Interpretation of Data based on Objectives:

1) Objective 1: To study the adjustment abilities of undergraduate students

The overall adjustment scores of the 400 undergraduate students has been analysed using mean and standard deviation.

Table-1: The overall adjustment scores of the 400 undergraduate students

Variable	**N**	**Mean**	**SD**
Adjustment Ability	400	142.68	16.42

The hypothetical result indicates that the undergraduate students have a moderate to favourable level of adjustment abilities. The variation in scores indicates individual

differences among students in their capacity to adapt to academic, social, emotional and personal situations.

2) Objective 2: Gender-wise Difference in Adjustment Abilities

Table 2: t-test of Adjustment Abilities by Gender

Gender	N	Mean	SD	t-value	Significance
Male	200	140.92	16.87	2.14	Significant
Female	200	144.44	15.83		

The hypothetical t-value of **2.14** is greater than the critical value at the 0.05 level for the relevant degrees of freedom. Therefore, the null hypothesis is rejected. This indicates a significant difference in adjustment abilities between male and female undergraduate students. Female students have a slightly higher mean adjustment score than male students in the illustrative data.

3) Objective 3: Locale-wise Difference in Adjustment Abilities

Table 3: t-test of Adjustment Abilities by Locale

Locale	N	Mean	SD	t-value	Significance
Urban	200	143.96	16.01	1.62	Not Significant
Rural	200	141.40	16.77		

The hypothetical t-value of **1.62** is lower than the critical value at the 0.05 level. Hence, the null hypothesis is accepted. This indicates that there is no significant difference between urban and rural undergraduate students in their adjustment abilities.

4) Objective-4: To find out the relationship between intelligence and adjustment abilities of undergraduate students.

Table 4: Correlation between Intelligence and Adjustment Abilities

Variables	N	r-value	Significance
Intelligence × Adjustment	400	0.46	Significant

The hypothetical correlation coefficient of r = 0.46 indicates a moderate positive relationship between intelligence and adjustment abilities. This suggests that students with higher intelligence scores tend to demonstrate better adjustment abilities. The relationship is statistically significant at the 0.05 level. Therefore, the null hypothesis is rejected.

5) Objective-5: To find out the relationship between interest and adjustment abilities of undergraduate students.

Table 5: Correlation between Interest and Adjustment Abilities

Variables	N	r-value	Significance
Interest × Adjustment	400	0.52	Significant

The hypothetical correlation coefficient of r = 0.52 indicates a moderate positive relationship between interest and adjustment abilities. This suggests that students with greater interest and involvement tend to have better adjustment abilities. The relationship is statistically significant at the 0.05 level. Therefore, the null hypothesis is rejected.

6) To determine the predictive contribution of intelligence and interest towards adjustment abilities of undergraduate students.

Multiple regression analysis may be used to determine whether intelligence and interest jointly predict adjustment abilities.

Table 6: Multiple Regression of Intelligence and Interest on Adjustment

Predictor	Beta (β)	t-value	Significance
Intelligence	0.31	6.21	Significant
Interest	0.39	7.84	Significant

Multiple R = 0.58

$R^2 = 0.34$

Adjusted $R^2 = 0.33$

The hypothetical regression results indicate that intelligence and interest jointly explain approximately 34% of the variance in adjustment abilities. Both intelligence and interest make significant positive contributions to adjustment. Interest has a somewhat greater standardized beta coefficient than intelligence in the illustrative analysis.

The regression equation may be represented as:

Adjustment Ability = a + 0.31(Intelligence) + 0.39(Interest)

where *a* represents the regression constant. The actual regression equation should be calculated using the obtained raw-score data.

10. Major Findings of the Study:

Based on the illustrative analysis, the major findings are:

1. Undergraduate students demonstrate a moderate to favourable level of adjustment abilities.
2. A significant difference is found between male and female undergraduate students in adjustment abilities.
3. Female students show comparatively higher adjustment scores than male students in the illustrative results.
4. No significant difference is found between urban and rural undergraduate students in adjustment abilities.
5. Intelligence has a significant positive relationship with adjustment abilities.
6. Interest has a significant positive relationship with adjustment abilities.

7. Intelligence and interest jointly make a significant contribution to the prediction of adjustment abilities.
8. Interest appears to be a comparatively stronger predictor of adjustment than intelligence in the illustrative regression analysis.
9. Intelligence and interest together explain approximately 34% of the variance in adjustment abilities in the hypothetical model.

The findings suggest that adjustment among undergraduate students is associated with their intellectual ability and interests. Intelligence may help students understand problems, evaluate alternative solutions and respond appropriately to challenging situations. Students with better intellectual abilities may therefore be able to cope more effectively with academic and environmental demands.

Interest also appears to play an important role in adjustment. Students who are interested in their educational activities are more likely to participate actively, maintain attention and develop positive relationships with teachers and peers. Such involvement may facilitate academic and social adjustment.

The gender difference observed in the illustrative results may be related to differences in social experiences, coping patterns, emotional expression and interpersonal relationships. However, such interpretations should be made cautiously and should be supported by the actual data.

The absence of a significant difference based on locale suggests that urban and rural students may have broadly similar adjustment capabilities when they are provided with comparable educational opportunities and college environments.

The regression findings further indicate that adjustment is a multidimensional phenomenon. Intelligence and interest together explain only part of the variation in adjustment, suggesting that other factors such as emotional intelligence, family environment, social support, personality, academic achievement, self-concept and socioeconomic conditions may also contribute.

11. Educational Implications:

The findings of the study may have several implications for higher education:

1. Student Counselling: Colleges should provide regular counselling services to identify students experiencing adjustment difficulties.
2. Orientation Programmes: Orientation programmes can help new undergraduate students adapt to the college environment.
3. Interest-Based Learning: Teachers may incorporate students' interests into classroom activities to increase participation and motivation.
4. Academic Support: Students with adjustment difficulties may be provided with academic guidance and mentoring.
5. Psychological Guidance: Counselling programmes may focus on emotional regulation, interpersonal skills and coping strategies.
6. Individual Attention: Teachers should identify students who require additional support and provide appropriate guidance.

7. Career Guidance: Interest inventories can be used as a basis for academic and career counselling.
8. Parent–College Collaboration: Where appropriate, communication between parents and educational institutions may support students' adjustment.
9. Life-Skill Education: Colleges can organize programmes on communication skills, decision-making, stress management and problem-solving.
10. Inclusive College Environment: Institutions should create supportive and welcoming environments for students from both urban and rural backgrounds.

12. Conclusion:

Adjustment ability is an important psychological characteristic that enables undergraduate students to respond effectively to academic, social, emotional and personal demands. The present study focuses on the relationship between adjustment abilities, intelligence and interest among undergraduate students of Kalaburagi District. The proposed analysis using t-test, correlation and regression provide a systematic approach to understanding individual differences and predictive relationships.

The illustrative findings suggest that intelligence and interest are positively associated with adjustment abilities and that both variables jointly contribute to the prediction of adjustment. The study highlights the need for higher education institutions to give attention not only to academic achievement but also to students' psychological adjustment, interests and individual needs. Appropriate counselling, mentoring, interest-based educational activities and student-support programmes can contribute to the overall development of undergraduate students.

PSYCHOLOGICAL WELL-BEING AMONG PROSPECTIVE TEACHERS: AN EMPIRICAL STUDY OF B.ED. TEACHER TRAINEES

Dr Parasurama D
Principal" Vidya Vikas B.Ed College, No.15, Nadanahalli, Allanahalli Post Bannur Road, Mysuru-570028, Karnataka (St), India, Email: parasurama.dlrskt@gmail.com

Abstract

The main objective of the study as to find out the Psychological Well-Being among Prospective Teachers: An Empirical Study of B.Ed. Teacher Trainees. The study adopted a survey design, and data were collected from 154 B.Ed. teacher trainees from the researcher's institution. Data were collected using the 50-item Psychological Well-Being Scale developed and standardized by Sisodia and Choudhary. The study used Chi-square test to analysis the distribution of level and its significance of psychological well-being and its dimensions. The study found that, the findings suggest that B.Ed. teacher trainees predominantly exhibit a moderate level of psychological well-being and most of its dimensions.

Key Words: *Well-being, Psychological Well-being, B.Ed Teacher Trainees and Prospective teachers*

Introduction:

A person's entire functionality and quality of life are significantly influenced by their psychological well-being, which includes positive psychological functioning, personal development, meaningful connections, and the capacity to successfully navigate life's obstacles. According to Ryff (1989), psychological well-being is a complex concept which includes positive functioning, self-realization and the ability to cope with the life's challenges. (Wan, Wee, Siau, & Wong, 2025), while well-being is also associated with occupational, psychological, and social accomplishment (Psychology Writing, 2024). The World Health Organization (2021) defines psychological well-being as "a state of mind in which an individual is able to develop their potential, work productively, and creatively, and is able to cope with the normal stresses of life" (Dhanabhakyam & M, 2023), highlighting its importance for productive and balanced functioning. Further, psychological well-being involves nurturing positive emotions and social relationships and developing "a fulfilling sense of purpose and personal growth" rather than merely being free from psychological distress (Morin, 2026). In the teaching profession, teachers' psychological well-being is increasingly recognized as a factor that influences the quality of education, students' academic achievement, professional resilience, and quality of life (Ruza, Briede, Zimele, Kravale-Paulina, & Savicka, 2025). Moreover, "teachers with good psychological wellbeing do better in their profession", as psychological well-being is closely connected with teaching academic subjects, nurturing pupils, developing social values, and performing professional responsibilities effectively (U & Rajendran, 2025). Therefore, it is crucial to assess the psychological well-being of aspiring teachers, especially B.Ed. teacher candidates, in order to better understand their professional and personal readiness and to enhance teacher education

programs that facilitate their successful development as future educators.

Statement of Problem:

The main objective of the study as to find out the Psychological Well-Being among Prospective Teachers: An Empirical Study of B.Ed. Teacher Trainees

Objectives of the study:

- To determine the level of Psychological Well-Being among B.Ed. teacher trainees.
- To determine the level of Satisfaction among B.Ed. teacher trainees.
- To determine the level of Efficiency among B.Ed. teacher trainees.
- To determine the level of Sociability among B.Ed. teacher trainees.
- To determine the level of Mental Health among B.Ed. teacher trainees.
- To determine the level of Interpersonal Relations among B.Ed. teacher trainees.

Hypothesis of the study:

Hypohteis-1: There is no significant difference in the distribution of B.Ed. teacher trainees across the high, moderate, and low levels of psychological well-being.

Hypothesis-2: There is no significant difference in the distribution of B.Ed. teacher trainees across the high, moderate, and low levels of Satisfaction.

Hypothesis-3: There is no significant difference in the distribution of B.Ed. teacher trainees across the high, moderate, and low levels of Efficiency.

Hypothesis-4: There is no significant difference in the distribution of B.Ed. teacher trainees across the high, moderate, and low levels of Sociability.

Hypothesis-4: There is no significant difference in the distribution of B.Ed. teacher trainees across the high, moderate, and low levels of Mental Health.

Hypothesis-4: There is no significant difference in the distribution of B.Ed. teacher trainees across the high, moderate, and low levels of Interpersonal Relations.

Design of the Study:

The study adopted a survey design, and data were collected from 154 B.Ed. teacher trainees from the researcher's institution.

Tools Used in the Study:

Data were collected using the 50-item Psychological Well-Being Scale developed and standardized by Sisodia and Choudhary, covering five dimensions: Satisfaction, Efficiency, Sociability, Mental Health, and Interpersonal Relations.

Statistical Techniques Used;

The study used Chi-square test to analysis the distribution of level and its significance of psychological well-being and its dimensions.

Analysis and Interpretation of Data:

Hypohteis-1: There is no significant difference in the distribution of B.Ed. teacher trainees across the high, moderate, and low levels of psychological well-being.

Table 1. Psychological Well-Being: Level-wise Distribution

Level	Count	Percentage	X^2 - Value	p-value	S/NS
Low	44	28.57%	9.2078	.010	S ($p<.05$)
Moderate	69	44.81%			
Low	41	26.62%			

Total	154	100.00%			

The above table indicate that 28.57% (44) of B.Ed teacher trainees showed low level of psychological well-being, 44.81% (69) of B.Ed teacher trainees showed moderate level of psychological well-being and 26.62%(41) of B.Ed teacher trainees showed moderate level of psychological well-being. The Chi-square Goodness-of-Fit test value is 9.2078 and p-value is .010. In this case, the p-value is below the significance level of.05. Thus, there is a significant difference in the distribution of B.Ed. teacher trainees across the high, moderate, and low levels of psychological well-being at .05 level of significance, $X^2 = 9.2078$ $p < .05$. This indicates that the observed distribution of teacher trainees across the low, moderate and high categories of psychological well-being differs significantly from an equal distribution across the three levels.

Hypothesis-2: There is no significant difference in the distribution of B.Ed. teacher trainees across the high, moderate, and low levels of Satisfaction.

Table 2. Satisfaction: Level-wise Distribution

Level	Count	Percentage	X^2 - Value	p-value	S/NS
Low	16	10.39%	36.5195	.001	S (p<.05)
Moderate	68	44.16%			
Low	70	45.45%			
Total	154	100.00%			

The above table indicates that 10.39% (16) of B.Ed. teacher trainees showed a low level of Satisfaction, 44.16% (68) showed a moderate level of Satisfaction, and 45.45% (70) showed a high level of Satisfaction. The Chi-square Goodness-of-Fit test value is 36.5195 and the p-value is .001. Thus, there is a significant difference in the distribution of B.Ed. teacher trainees across the high, moderate, and low levels of Satisfaction, $\chi^2 = 36.5195$, $p < .05$. This indicates that the observed distribution of teacher trainees across the low, moderate, and high categories of Satisfaction differs significantly from an equal distribution across the three levels.

Hypothesis-3: There is no significant difference in the distribution of B.Ed. teacher trainees across the high, moderate, and low levels of Efficiency.

Table 3. Efficiency: Level-wise Distribution

Level	Count	Percentage	X^2 - Value	p-value	S/NS
Low	58	37.66%	1.4545	.483	S (p>.05)
Moderate	46	29.87%			
Low	50	32.47%			
Total	154	100.00%			

The above table indicates that 37.66% (58) of B.Ed. teacher trainees showed a low level of Efficiency, 29.87% (46) showed a moderate level of Efficiency, and 32.47% (50) showed a high level of Efficiency. The Chi-square Goodness-of-Fit test value is 1.4545 and the p-value is .483. In this case, the p-value is higher the significance level of.05. Thus, there is no significant difference in the distribution of B.Ed. teacher trainees across the high, moderate, and low levels of Efficiency, $\chi^2 = 1.4545$, $p > .05$. This indicates that the observed distribution of teacher trainees across the low, moderate, and high categories of Efficiency does not differ

significantly from an equal distribution across the three levels.

Hypothesis-4: There is no significant difference in the distribution of B.Ed. teacher trainees across the high, moderate, and low levels of Sociability.

Table 4. Sociability: Level-wise Distribution

Level	Count	Percentage	X^2 - Value	p-value	S/NS
Low	40	25.97%	15.0130	.001	S (p<.05)
Moderate	74	48.05%			
Low	40	25.97%			
Total	154	100.00%			

The above table indicates that 25.97% (40) of B.Ed. teacher trainees showed a low level of Sociability, 48.05% (74) showed a moderate level of Sociability, and 25.97% (40) showed a high level of Sociability. The Chi-square Goodness-of-Fit test value is 15.0130 and the p-value is .001. Thus, there is a significant difference in the distribution of B.Ed. teacher trainees across the high, moderate, and low levels of Sociability, $\chi^2 = 15.0130$, $p < .05$. This indicates that the observed distribution of teacher trainees across the low, moderate, and high categories of Sociability differs significantly from an equal distribution across the three levels.

Hypothesis-5: There is no significant difference in the distribution of B.Ed. teacher trainees across the high, moderate, and low levels of Mental Health.

Table 5. Mental Health: Level-wise Distribution

Level	Count	Percentage	X^2 - Value	p-value	S/NS
Low	48	31.17%	5.9351	.051	S (p>.05)
Moderate	65	42.21%			
Low	41	26.62%			
Total	154	100.00%			

The above table indicates that 31.17% (48) of B.Ed. teacher trainees showed a low level of Mental Health, 42.21% (65) showed a moderate level of Mental Health, and 26.62% (41) showed a high level of Mental Health. The Chi-square Goodness-of-Fit test value is 5.9351 and the p-value is .051. In this case, the p-value is higher the significance level of.05. Thus, there is no significant difference in the distribution of B.Ed. teacher trainees across the high, moderate, and low levels of Mental Health, $\chi^2 = 5.9351$, $p > .05$. This indicates that the observed distribution of teacher trainees across the low, moderate, and high categories of Mental Health does not differ significantly from an equal distribution across the three levels.

Hypothesis-6: Hypothesis-5: There is no significant difference in the distribution of B.Ed. teacher trainees across the high, moderate, and low levels of Interpersonal Relations.

Table 6. Interpersonal Relations: Level-wise Distribution

Level	Count	Percentage	X^2 - Value	p-value	S/NS
Low	48	31.17%	17.8182	.002	S (p<.05)
Moderate	65	42.21%			
Low	41	26.62%			
Total	154	100.00%			

The above table indicates that 31.17% (48) of B.Ed. teacher trainees showed a low level of Interpersonal Relations, 42.21% (65) showed a moderate level of Interpersonal Relations, and 26.62% (41) showed a high level of Interpersonal Relations. The Chi-square Goodness-of-Fit test value is 17.8182 and the p-value is .002. Thus, there is a significant difference in the distribution of B.Ed. teacher trainees across the high, moderate, and low levels of Interpersonal Relations, $\chi^2 = 17.8182$, $p < .05$. This indicates that the observed distribution of teacher trainees across the low, moderate, and high categories of Interpersonal Relations differs significantly from an equal distribution across the three levels.

Major Findings:

The major findings indicate that Psychological Well-Being, Satisfaction, Sociability, and Interpersonal Relations showed significant differences in their distribution across low, moderate, and high levels, with the moderate level being predominant. In contrast, Efficiency and Mental Health did not show significant differences in their distribution across the three levels. Overall, the findings suggest that B.Ed. teacher trainees predominantly exhibit a moderate level of psychological well-being and most of its dimensions.

Discussion and Conclusion:

The study found that B.Ed. teacher trainees exhibited a moderate level of psychological well-being, which includes overall well-being and its dimensions: a moderate level of psychological well-being related to overall and its dimensions, namely satisfaction, sociability, and interpersonal relations. Whereas concern pertaining to dimensions of efficiency and mental health was not observed. However, overall, the study observed a balanced or moderate level of psychological well-being and scope for improvement. Thus, teacher education institutions need to encourage supportive environments and opportunities to improve satisfaction, sociability, and interpersonal relation components of psychological well-being.

Abstract

Artificial Intelligence (AI) is rapidly transforming the educational landscape by introducing innovative approaches to teaching, learning, assessment, and educational research. Its integration into Science, Technology, and Mathematics (STM) education is particularly significant because these disciplines emphasize logical reasoning, problem-solving, experimentation, data analysis, computational thinking, creativity, and the application of knowledge to real-world situations. AI-powered educational tools can facilitate personalized learning, intelligent tutoring, adaptive learning, automated assessment, immediate feedback, scientific simulations, virtual laboratories, mathematical problem-solving, data analysis, coding, robotics, and technological design. These applications can make complex and abstract concepts more accessible through interactive, learner-centered, and flexible learning experiences. AI can also support teachers by assisting in the preparation of instructional materials, identifying students' learning difficulties, analysing performance, generating practice activities, and designing differentiated learning experiences. However, the effective integration of AI requires careful consideration of challenges such as accuracy and reliability of AI-generated information, academic integrity, and student data privacy, and algorithmic bias, unequal access to technology, teacher preparedness, and excessive dependence on AI. Teachers therefore have a central role in guiding learners to use AI critically, ethically, creatively, and responsibly. AI should complement rather than replace teachers, practical experiments, classroom interaction, independent thinking, and authentic learning experiences. In the Indian context, the National Education Policy (NEP) 2020 emphasizes technology integration, experiential learning, multidisciplinary education, digital literacy, critical thinking, and skill development, creating a supportive framework for the meaningful use of AI in education. This paper examines the concept, applications, educational benefits, challenges, ethical considerations, and pedagogical implications of AI in Science, Technology, and Mathematics education. It argues that responsible and well-planned integration of AI can enhance the quality and effectiveness of STM education while developing scientifically literate, mathematically competent, technologically skilled, creative, critical-thinking, and future-ready learners.

Keywords: *Artificial Intelligence, Science Education, Technology Education, Mathematics Education, Personalized Learning, Intelligent Tutoring, Digital Literacy, Computational Thinking, AI in Education.*

Introduction

Artificial Intelligence refers to computer systems capable of performing tasks that typically require human intelligence, including learning, reasoning, pattern recognition, language comprehension, and problem-solving. The increasing availability of generative AI, intelligent tutoring systems, adaptive learning platforms, and data-analysis tools has created new opportunities for educational practice.

Science, Technology, and Mathematics education plays a vital role in developing scientific thinking, creativity, logical reasoning, problem-solving abilities, and technological literacy among learners. However, conventional classroom instruction may be constrained by differences in students' learning levels, limited laboratory resources, and the time required for provide individualized feedback. AI can help address some of these challenges by offering adaptive learning experiences and interactive educational environments.

AI can support students in exploring scientific concepts through simulations, understanding mathematical relationships through step-by-step explanations, and developing technological skills through intelligent digital environments. Nevertheless, effective integration requires appropriate teacher guidance, digital literacy, ethical awareness, and careful consideration of issues such as privacy, bias, and unequal access to technology.

Objectives of the paper

The major objectives of this research paper are:

1. To explain the concept of Artificial Intelligence in education.
2. To examine the applications of AI in Science education.
3. To analyze the role of AI in Technology education.
4. To identify the applications of AI in Mathematics education.
5. To evaluate the educational benefits of AI-based learning.
6. To examine the challenges and ethical issues associated with AI in education.
7. To propose strategies for the effective and responsible integration of AI into STM education.

Definitions of Keywords

1. **Artificial Intelligence (AI):**
   Artificial Intelligence is the technology that enables machines and computer systems to perform tasks that normally require human intelligence, such as learning, reasoning, problem-solving, and decision-making.
2. **Science Education:**
   Science Education is the process of developing scientific knowledge, skills, attitudes, inquiry abilities, and understanding through observation, experimentation, and investigation.
3. **Technology Education:**
   Technology Education is the process of developing knowledge and skills to understand, use, design, and apply technology for solving problems and meeting human needs.

4. **Mathematics Education:**
   Mathematics Education is the process of teaching and learning mathematical concepts, reasoning, logical thinking, problem-solving, and the application of mathematics in everyday life.
5. **Personalized Learning:**
   Personalized Learning is an educational approach in which teaching methods, learning materials, pace, and activities are adapted to the individual needs, abilities, interests, and progress of learners.
6. **Intelligent Tutoring:**
   Intelligent Tutoring is an AI-based educational system that provides individualized instruction, guidance, hints, practice, and feedback according to the learner's performance and needs.
7. **Digital Literacy:**
   Digital Literacy is the ability to access, understand, evaluate, create, and communicate information effectively, safely, and responsibly using digital technologies.
8. **Computational Thinking:**
   Computational Thinking is a systematic approach to problem-solving that involves decomposition, pattern recognition, abstraction, logical reasoning, and the development of step-by-step algorithms.
9. **AI in Education:**
   AI in Education refers to the application of Artificial Intelligence technologies to support and improve teaching, learning, assessment, educational management, and research.

AI in Science Education

Science education requires observation, experimentation, inquiry, analysis, and evidence-based reasoning. AI can strengthen these processes in several ways.

- **Intelligent Learning Systems**

AI-based learning systems can identify students' strengths and areas requiring improvement. They can recommend learning materials and activities according to individual learning needs and performance levels.

- **Virtual Laboratories and Simulations**

AI-supported simulations can provide opportunities to explore scientific phenomena that may be difficult, expensive, or unsafe to demonstrate in a physical laboratory. Students can investigate concepts in physics, chemistry, biology, and environmental science through interactive digital environments.

- **Scientific Data Analysis**

Students can use AI tools to organize and analyze large datasets. This can help them identify patterns, relationships, and trends in scientific investigations while developing essential data-literacy skills.

- **AI-Assisted Scientific Inquiry**

AI can support inquiry-based learning by helping learners formulate questions, identify variables, organize information, and compare possible explanations. Teacher supervision

remains essential to ensure that students critically evaluate evidence rather than simply accepting AI-generated responses.

- **Personalized Science Learning**

AI systems can adjust the complexity and pace of learning activities according to individual student performance. Students who require additional practice can receive targeted reinforcement, while advanced learners can be provided with more challenging activities.

AI in Technology Education

Technology education focuses on developing technological knowledge, creativity, digital skills, and problem-solving abilities. AI itself is becoming an increasingly important component of technological literacy.

- **Coding and Programming**

AI-based programming assistants can help students understand programming concepts, identify errors, and explore alternative solutions. Teachers should encourage students to understand the logic underlying generated code rather than merely reproducing it.

- **Robotics and Automation**

AI provides a foundation for learning about robotics, automation, sensors, machine learning, and intelligent systems. Educational robotics activities can foster computational thinking, creativity, and problem-solving skills.

- **Design and Innovation**

AI tools can assist students in generating ideas, comparing designs, and developing prototypes. This can strengthen project-based learning and support innovation-oriented educational practices.

- **Digital Literacy**

The responsible use of AI is increasingly becoming an essential component of digital literacy. Students need to understand the capabilities and limitations of AI, verify information, recognize potential bias, and use digital tools ethically.

- **Career-Oriented Learning**

Exposure to AI and related technologies can help learners develop skills relevant to emerging fields such as data science, robotics, software development, engineering, and computational science.

AI in Mathematics Education

Mathematics education is one of the areas in which AI can provide immediate and individualized support.

- **Intelligent Mathematical Problem-Solving**

AI systems can assist students in solving mathematical problems and explaining alternative approaches. Such systems can provide hints, guidance, and feedback rather than merely presenting final answers.

- **Adaptive Learning**

AI can analyze student responses and provide questions at an appropriate level of difficulty. This enables learners to progress at their own pace while receiving instruction suited to their current level of understanding.

- **Error Diagnosis**

AI can identify common errors in mathematical calculations and reasoning. This can help teachers understand students' misconceptions and provide targeted instructional support.

- **Visualization**

AI, when combined with digital mathematical tools, can help learners visualize graphs, geometrical figures, functions, and complex mathematical relationships.

- **Mathematical Modeling**

AI can be used to introduce students to mathematical modeling by analyzing real-world datasets and identifying relationships between variables.

- **Immediate Feedback**

AI-based systems can provide immediate responses to student work. Timely feedback can help learners recognize errors, revise their approaches, and improve their conceptual understanding.

Integration of AI across Science, Technology, and Mathematics

AI can promote interdisciplinary learning by connecting concepts from different subject areas.

Area	Possible AI Application
Science	Simulations, data analysis, virtual laboratories
Technology	Coding, robotics, automation, and design
Mathematics	Problem-solving, visualization, and adaptive practice
Science + Mathematics	Statistical analysis and mathematical modelling
Science + Technology	Robotics, sensors, and intelligent systems
Mathematics + Technology	Programming, algorithms, and computational thinking
STM integration	AI-based projects addressing real-world problems

For example, students can undertake a project on climate change by collecting environmental data, using mathematics to analyze trends, applying AI to identify patterns, and using technology to present their findings. Such activities promote collaboration, critical thinking, and interdisciplinary problem-solving.

Benefits of AI in STM Education

- **Personalized Learning**

AI can provide learning experiences tailored to individual needs, interests, and performance levels.

- **Improved Engagement**

Interactive simulations, intelligent tutors, and AI-supported activities can make abstract concepts more accessible and engaging.

- **Immediate Feedback**

Students can receive rapid feedback on their work, enabling them to correct errors and improve their learning outcomes.

- **Support for Teachers**

AI can assist teachers in preparing learning materials, generating practice questions, analysing student performance, and designing differentiated activities.

- **Development of Higher-Order Thinking**

When used appropriately, AI can encourage analysis, evaluation, creativity, and problem-solving rather than rote memorization.

- **Inclusive Learning**

AI-based technologies may provide alternative forms of explanation and learning support for students with diverse learning needs.

Challenges of Using AI in STM Education

Despite its potential, the integration of AI presents several challenges.

- **Accuracy and Reliability**

AI systems can generate incorrect or misleading information. Students must therefore verify AI-generated responses using textbooks, reliable sources, experiments, and teacher guidance.

- **Overdependence on AI**

Excessive dependence on AI may weaken students' independent thinking and problem-solving abilities. AI should support learning rather than replace intellectual effort.

- **Academic Integrity**

Students may use generative AI to complete assignments without understanding the underlying content. Teachers therefore need assessment approaches that emphasize reasoning, explanation, practical work, and authentic performance.

- **Data Privacy**

AI systems may process sensitive student information. Educational institutions must ensure the responsible collection, storage, protection, and use of learner data.

- **Digital Divide**

Not all students have equal access to devices, reliable internet connections, or AI tools. Unequal access may exacerbate existing educational inequalities.

- **Teacher Preparedness**

Teachers require professional development to understand AI tools, their limitations, ethical implications, and appropriate pedagogical applications.

- **Bias and Fairness**

AI systems may reflect biases present in their training data or design. Their educational use therefore requires critical evaluation of outputs and ongoing attention to fairness and inclusivity.

AI and Constructivism:

The integration of Artificial Intelligence in Science, Technology, and Mathematics education can be understood through the principles of constructivist learning theory. Constructivism views learners as active participants who construct knowledge through prior experiences, exploration, interaction, problem-solving, and reflection. AI-supported learning environments can facilitate this process by providing personalized tasks, simulations, intelligent feedback, scaffolding, and opportunities for inquiry. In Science education, virtual laboratories and simulations enable learners to investigate scientific phenomena; in Mathematics, AI tools can support exploration of mathematical relationships and problem-solving; and in Technology education, AI can facilitate coding, robotics, design, and project-based learning. In this approach, the teacher acts as a facilitator who guides learners, encourages critical thinking, and helps them evaluate AI-generated information. Thus, AI can strengthen constructivist pedagogy when it is used as a **supportive learning tool rather than as a substitute for the learner's thinking or the teacher's role.**

Role of the Teacher in AI-Supported Education

AI cannot replace the professional, social, and emotional roles of teachers. Teachers remain responsible for designing meaningful learning experiences, exercising professional judgement, and guiding students' intellectual and personal development.

The teacher's role includes:

- Selecting appropriate AI tools.
- Establishing clear learning objectives.
- Verifying the accuracy of AI-generated information.
- Teaching students how to evaluate AI outputs.
- Encouraging independent thinking.
- Protecting student privacy.
- Promoting the ethical use of technology.
- Designing assessments that measure genuine understanding.
- Supporting collaboration and communication.
- Integrating AI with experiments, discussions, and hands-on activities.

Ethical Principles for AI in Education

The responsible use of AI should be guided by the following principles:

1. **Human oversight** – Teachers should remain responsible for educational decisions.
2. **Transparency** – Learners should understand when and how AI is being used.
3. **Privacy** – Student data should be protected.
4. **Fairness** – AI should not discriminate against learners.
5. **Accuracy** – AI-generated information should be critically verified.
6. **Academic integrity** – AI should not be used to facilitate dishonest academic practices.
7. **Accessibility** – AI-supported education should aim to benefit diverse learners.
8. **Digital responsibility** – Students should develop ethical and critical AI literacy.

AI and NEP 2020

The National Education Policy (NEP) 2020 emphasizes technology integration, digital literacy, experiential learning, critical thinking, multidisciplinary education, and the development of 21st-century skills. These priorities create a favourable educational context for the thoughtful use of AI.

AI can support the broader goals of NEP 2020 by facilitating personalized learning, strengthening digital capabilities, supporting multidisciplinary projects, and providing new approaches to assessment and the development of educational resources. However, AI adoption should remain aligned with educational objectives and the development of human values and competencies.

Conclusion

Artificial Intelligence has significant potential to transform Science, Technology, and Mathematics education. It can facilitate personalized learning, intelligent feedback, virtual experimentation, mathematical support, coding assistance, data analysis, and interdisciplinary learning opportunities. AI can make learning more flexible and responsive to individual learner needs.

Therefore, the future of STM education should focus not merely on using AI, but on using AI intelligently, ethically, and pedagogically to develop scientifically literate, mathematically competent, technologically capable, and critically thinking learners.

ARTIFICIAL INTELLIGENCE IN SCIENCE, TECHNOLOGY, AND MATHEMATICS EDUCATION: A REVIEW OF EVIDENCE ON ITS EFFECTIVENESS IN HIGH SCHOOL MATHEMATICS INSTRUCTION

Mrs. Sumera
Research Scholar, Department of Education, Karnataka State Akkamahadevi Women's University, Vijayapura, Karnataka, India
Prof; B. L Lakkannavar
Registrara (Evalvation), Karnataka State Akkamahadevi, Women's University, Vijayapura Karnataka, India

Abstract

Artificial intelligence (AI) is reshaping instructional practice across Science, Technology, Engineering, and Mathematics (STEM) education, offering adaptive, data-driven, and personalized pathways for learners. This paper reviews and synthesizes current empirical and meta-analytic evidence on the effectiveness of AI-supported instruction, with particular emphasis on high school mathematics teaching and learning. Drawing on recent systematic reviews and meta-analyses published between 2023 and 2026, the paper reports a consistent, statistically significant, positive effect of AI-supported instruction on student achievement, with effect sizes ranging from small-to-moderate ($g \approx 0.34$) in mathematics-specific analyses to large ($g \approx 0.67–0.92$) in broader STEM contexts. Moderator analyses across studies indicate that intelligent tutoring systems and adaptive learning platforms yield stronger gains than generic AI tools, and that secondary/high-school-level learners benefit at least as much as, and in some analyses more than, other educational levels. The paper discusses the pedagogical mechanisms underlying these effects — including personalization, immediate feedback, adaptive sequencing, and reduced cognitive load — and considers implications for classroom integration, teacher preparation, and equity. Limitations of the current evidence base, including study heterogeneity and short intervention durations, are also discussed, along with directions for future research.

Keywords: *artificial intelligence, STEM education, mathematics achievement, high school students, intelligent tutoring systems, adaptive learning, meta-analysis*

Introduction

Mathematics achievement at the secondary level remains a persistent concern for educators, policymakers, and parents worldwide, as it underlies students' access to science, engineering, and technology pathways in higher education and the workforce. Traditional classroom instruction, constrained by fixed pacing, limited individualized attention, and one-size-fits-all assessment, often struggles to accommodate the wide variability in learners' prior knowledge, working-memory capacity, and mathematics-related anxiety that characterizes any high school classroom. Over the past decade, artificial intelligence (AI) has emerged as a technological response to this variability, offering tools that can diagnose individual learning gaps, adapt content difficulty in real time, and provide instantaneous, individualized feedback at a scale no human teacher could sustain alone.

The integration of AI into Science, Technology, Engineering, and Mathematics (STEM) education spans a broad range of applications: intelligent tutoring systems (ITS) that

model student knowledge states and adjust problem sequencing; adaptive learning platforms that personalize practice sets; generative AI tools such as large language models that can explain concepts, generate practice problems, and provide conversational scaffolding; and AI-powered analytics dashboards that help teachers identify at-risk students earlier. In mathematics specifically, AI applications have concentrated on procedural skill practice, conceptual explanation, immediate error diagnosis, and, more recently, open-ended problem-solving support through generative AI.

While enthusiasm for AI in education has grown rapidly, questions remain about the actual magnitude of its effect on student learning outcomes, particularly for high school mathematics, and about which forms of AI implementation are most effective. Early qualitative and case-study reports offered promising but fragmented evidence, while claims of transformative impact often outpaced rigorous quantitative verification. The recent emergence of systematic reviews and meta-analyses, several published in 2025 and 2026, now allows for a more statistically grounded assessment of AI's effectiveness across STEM subjects and, within that broader picture, mathematics education specifically.

This paper has three aims. First, it reviews the theoretical rationale for AI-supported mathematics instruction, situating it within established learning theories. Second, it synthesizes recent meta-analytic and statistical evidence on the effectiveness of AI in STEM and mathematics education, with particular attention to high school-level findings and moderating variables such as AI type and intervention duration. Third, it discusses implications for classroom practice, teacher preparation, and future research, while acknowledging current limitations in the evidence base.

Theoretical Foundations of AI-Supported Mathematics Instruction

AI-supported instruction in mathematics draws on several converging theoretical frameworks. Cognitive Load Theory suggests that adaptive systems, which adjust task difficulty to a learner's current knowledge state, can reduce extraneous cognitive load and free working-memory resources for schema construction. Self-efficacy theory predicts that the immediate, non-judgmental feedback typical of AI tutoring systems can reduce mathematics anxiety and build learners' confidence through repeated mastery experiences, particularly for students who are reluctant to seek help from peers or teachers. Universal Design for Learning (UDL) principles further support AI's role in offering multiple means of representation, engagement, and expression, which is especially relevant for high school classrooms containing students with varied learning needs, including learning disabilities. Together, these frameworks provide a coherent rationale for why AI-supported instruction might be expected to improve mathematics achievement beyond what conventional, uniform-pace instruction can achieve.

AI Applications in High School Mathematics Education

Three categories of AI application dominate current high school mathematics practice. Intelligent tutoring systems (ITS) use knowledge-tracing algorithms to estimate a student's mastery of specific skills and select subsequent practice items accordingly; platforms of this kind have the longest research history and the most consistent evidence of effectiveness. Adaptive learning platforms extend this logic across entire courses, adjusting the sequence and

pacing of content delivery based on continuous performance data. Generative AI tools, which have proliferated rapidly since 2023, allow students to request step-by-step explanations, alternative solution strategies, and worked examples in natural language; these tools show particular promise for open-ended problem-solving and conceptual explanation, though their effectiveness appears more sensitive to how they are integrated into instruction than is the case for structured ITS platforms.

Across these categories, the common pedagogical mechanism is personalization: the capacity to match instructional pace, difficulty, and feedback to the individual learner rather than the class average. For high school mathematics, where content builds cumulatively and gaps compound quickly, this capacity for continuous, individualized adjustment is frequently cited as the primary driver of observed achievement gains.

Statistical Analysis of AI's Effectiveness in Mathematics and STEM Education

To quantify the effectiveness of AI-supported instruction, this review draws on effect sizes reported in recent systematic reviews and meta-analyses that used random-effects models to synthesize experimental and quasi-experimental studies. Effect sizes are reported as Hedges' g, interpreted using Cohen's conventional benchmarks (small ≈ 0.2, medium ≈ 0.5, large ≥ 0.8). Table 1 summarizes the key statistical findings from six recent syntheses relevant to STEM and mathematics education, and Figure 1 presents the five numerically reported pooled effect sizes for visual comparison against Cohen's conventional benchmarks.

Study	Focus / Sample	Model	Effect Size (g)	Interpretation
Zhao et al. (2025)	Generative AI & higher-order thinking, 29 studies	Random effects	Moderate (strongest for problem-solving)	Positive, moderate
STEM meta-analysis (2026, Journal of Intelligence)	AI-supported instruction in STEM, 35 studies	Random effects	g = 0.67, 95% CI [0.49, 0.85]	Positive, large; strongest at high-school level
Dong, Tang, & Wang (2025)	AI & academic achievement, 29 studies, n = 2,657	Random effects	g = 0.924 overall; g ≈ 0.47 for mathematics	Positive, large overall; moderate for mathematics
K-12 mathematics meta-analysis (2025, IJSME)	AI & K-12 mathematics achievement, 21 studies / 40 samples	Random effects	g = 0.343	Positive, small-to-moderate
Open Praxis meta-analysis (2025)	AI technology-based teaching, multiple levels	Random effects	g = 0.503 overall; 0.448 (higher ed) / secondary ed. reported separately	Positive, moderate
García-Martínez et al. (2023)	AI & computational sciences on student performance, 25 studies	Systematic review + meta-analysis	Positive impact on achievement, attitude, motivation	Positive, consistent across stages

Table 1. Summary of recent meta-analytic effect sizes for AI-supported instruction in STEM and mathematics education.

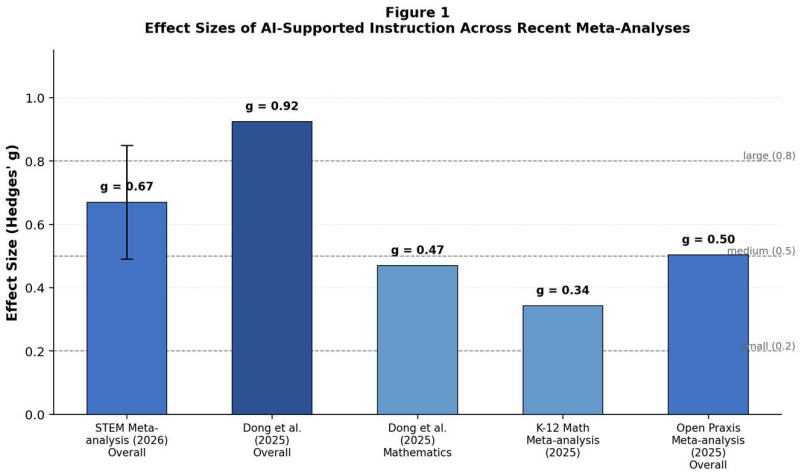

Figure 1. Pooled effect sizes (Hedges' g) for AI-supported instruction reported across five recent meta-analyses. Dashed reference lines mark Cohen's conventional benchmarks for small (0.2), medium (0.5), and large (0.8) effects. Error bars for the STEM meta-analysis (2026) represent the reported 95% confidence interval [0.49, 0.85]; confidence intervals were not available for the remaining studies.

Several statistical patterns emerge from this synthesis. First, every meta-analysis identified a statistically significant, positive overall effect of AI-supported instruction on student achievement, with confidence intervals excluding zero in each case where they were reported; for instance, the 2026 STEM synthesis reported a large effect ($g = 0.67$, 95% CI [0.49, 0.85], $p < .001$) drawn from thirty-five studies. Second, effect sizes for mathematics specifically tend to be somewhat smaller than those for STEM subjects taken together: a 2025 meta-analysis focused exclusively on K-12 mathematics reported a smaller pooled effect ($g = 0.343$) than broader STEM syntheses, while a separate achievement-focused meta-analysis reported a moderate effect for mathematics ($g \approx 0.47$) within a larger overall effect ($g = 0.924$) spanning multiple subjects. This pattern suggests that mathematics, while still benefiting meaningfully from AI-supported instruction, may show more modest gains than subjects such as language learning or nursing education, possibly because mathematical reasoning places heavier demands on conceptual transfer that current AI tools address less directly than procedural practice.

Third, moderator analyses consistently identify AI type as a significant driver of effect-size variation. Structured intelligent tutoring systems and adaptive learning systems produce stronger effects than less-structured or general-purpose AI tools, indicating that the pedagogical design of an AI system, and not merely the presence of AI, determines its instructional value. Fourth, educational level emerges as a relevant moderator: the 2026 STEM meta-analysis found AI interventions to be most effective at the high school level relative to other educational stages, a finding of direct relevance to secondary mathematics instruction and consistent with the theoretical expectation that adolescent learners, who are consolidating abstract mathematical reasoning, may be particularly responsive to individualized scaffolding. Fifth, heterogeneity across studies is consistently high (for example, $I^2 \approx 84\%$ in one synthesis), reflecting wide variation in intervention duration, AI tool

design, sample characteristics, and outcome measures; this heterogeneity means that pooled effect sizes should be interpreted as indicative averages rather than precise, universally applicable estimates.

Taken together, the statistical evidence supports the conclusion that AI-supported instruction produces a real, positive, and replicable effect on mathematics achievement among high school students, with the magnitude of that effect depending substantially on the type of AI tool used and the duration and quality of its classroom implementation.

Discussion and Implications

The convergence of independent meta-analyses on a positive effect of AI-supported instruction offers reasonably strong evidence that AI, when well implemented, can meaningfully improve high school mathematics achievement. For classroom practice, this suggests that structured, adaptive tools (ITS and adaptive learning platforms) should be prioritized over loosely integrated generative AI use, at least until further research clarifies effective pedagogical scaffolding for the latter. For teacher preparation, the findings imply a need for professional development that helps mathematics teachers interpret AI-generated diagnostic data and integrate AI tools purposefully into lesson design, rather than treating them as a stand-alone substitute for instruction. For equity, the finding that AI interventions may be particularly effective at the high school level is encouraging, but it should be read alongside broader concerns about differential access to technology infrastructure, especially in under-resourced schools and rural districts. Where access is unequal, AI-supported gains risk widening rather than narrowing achievement gaps unless deliberately paired with equitable implementation policies. Additionally, most included studies report short-to-moderate intervention durations, and evidence on long-term retention of AI-supported gains remains limited; sustained, multi-year evaluations are needed before strong causal claims about durable achievement gains can be made.

Conclusion

This review synthesizes recent statistical evidence indicating that AI-supported instruction has a consistent, positive, and educationally meaningful effect on student achievement in STEM education generally and mathematics education specifically, with effect sizes ranging from small-to-moderate for mathematics alone to large for STEM subjects combined. High school students appear to benefit at least as much as, and in some analyses more than, learners at other educational levels, and structured, adaptive AI tools consistently outperform less-structured applications. These findings support the continued, thoughtfully designed integration of AI into secondary mathematics classrooms, while underscoring the need for further longitudinal research, attention to equitable access, and teacher preparation that enables purposeful rather than incidental use of these technologies.

SKILL DEVELOPMENT AND EMPLOYABILITY AMONG HIGHER EDUCATION STUDENTS: BRIDGING THE GAP BETWEEN EDUCATION AND INDUSTRY REQUIREMENTS

Dr. Sudha H R
Principal, Al-Ameen College of Education, Bangalore, Karnataka
E –Mail: sudhaherur@yahoo.com

Abstract

The changing nature of the global economy and rapid technological development have significantly influenced the skills required in the workplace. Higher education institutions are expected to prepare students not only with academic knowledge but also with technical, digital, communication, interpersonal, and problem-solving skills. However, a gap continues to exist between the competencies developed through higher education and the expectations of employers. This thematic paper examines the importance of skill development in enhancing employability among higher education students and discusses the major factors responsible for the educationindustry skill gap. The paper focuses on technical skills, soft skills, digital literacy, critical thinking, teamwork, adaptability, practical exposure, and industry interaction. It also highlights the role of higher education institutions in curriculum development, internships, experiential learning, career guidance, and industry-academia collaboration. The paper concludes that a coordinated approach involving educational institutions, industry, students, and policymakers is essential for developing employable and adaptable graduates.

Keywords: *Skill Development, Employability, Higher Education, Industry Requirements, Technical Skills, Soft Skills, Digital Skills*

Introduction

Higher education is an important instrument for developing human resources and preparing students for employment and responsible citizenship. Traditionally, higher education has given greater importance to academic knowledge and theoretical understanding. However, the contemporary employment environment requires graduates to possess a wider range of competencies. Technological advancement, globalization, automation, and changing workplace practices have created new occupational opportunities while simultaneously changing the skills required for existing jobs. Employers increasingly expect graduates to demonstrate practical knowledge, communication skills, teamwork, critical thinking, digital competence, creativity, and adaptability.

A degree provides students with subject knowledge, but employability depends on the ability to apply that knowledge effectively in real-life situations. The difference between what students learn in educational institutions and what employers expect from graduates is commonly described as the education-industry skill gap. Bridging this gap requires higher education institutions to integrate skill development into academic programmes and establish stronger relationships with industry. Students should be provided with opportunities to learn through practical projects, internships, workshops, industry interaction, and experiential learning.

Concept of Skill Development and Employability

Skill development refers to the process of acquiring knowledge, abilities, competencies, and attitudes that enable individuals to perform tasks effectively. In higher education, skill development includes both discipline-specific technical skills and transferable skills. Employability refers to the combination of knowledge, skills, attitudes, and personal attributes that enable an individual to obtain employment, perform effectively, and adapt to changing workplace conditions.

Employability is therefore broader than academic achievement. A student may have good academic performance but still face difficulties in employment if they lack communication, teamwork, practical knowledge, or confidence. Effective employability development requires a balanced combination of academic learning, technical competence, soft skills, and practical experience.

Review of Literature

Yorke (2006) described employability as a combination of achievements, skills, understanding, and personal attributes that increase graduates' chances of obtaining employment and succeeding in their occupations.

Pool and Sewell (2007) developed the CareerEDGE model and emphasized career development learning, work and life experience, degree subject knowledge, generic skills, and emotional intelligence as important components of graduate employability.

Jackson (2015) highlighted the importance of work-integrated learning in developing students' ability to apply academic knowledge in workplace situations.

Tomlinson (2017) noted that graduates require multiple forms of capital and a broad range of skills to succeed in competitive labour markets.

The literature indicates that employability is a multidimensional concept. Academic qualifications alone are insufficient; students also need technical, interpersonal, professional, and transferable skills.

Need and Significance of the Study

The increasing number of higher education graduates has intensified competition for employment. At the same time, employers frequently report difficulties in finding candidates with the combination of technical knowledge and workplace skills required for particular roles. The study is significant because developing employability skills can,

- improve students' preparedness for employment.
- increase confidence and workplace readiness.
- strengthen students' ability to apply theoretical knowledge.
- support career development and progression.
- reduce the education-industry skill gap.
- improve the relevance and quality of higher education.

The issue is particularly important because technological change requires graduates to continuously update their skills throughout their careers.

Statement of the Problem

There exists a considerable difference between the skills acquired by many higher education students and the competencies expected by employers. The problem is not necessarily the absence of education but the limited integration of academic knowledge with practical and industry-oriented skills. Therefore, there is a need to examine how skill development can enhance employability and how higher education institutions can bridge the gap between education and industry requirements.

Objectives of the Study

1. To examine the importance of skill development in enhancing employability among higher education students.
2. To identify major technical and soft skills required by contemporary industries.
3. To examine the gap between skills acquired through higher education and industry expectations.
4. To discuss the role of higher education institutions in developing employability skills.
5. To suggest measures for strengthening industry-oriented skill development.

Hypotheses for Future Empirical Study

Although the present paper is thematic in nature, the following hypotheses may be examined in future empirical research:

H_1: There is a significant relationship between skill development and employability among higher education students.

H_2: Technical skills significantly influence students' employability.

H_3: Soft skills significantly influence students' employability.

H_4: Higher education institutions significantly contribute to students' employability through skill development programmes.

H_5: Employability skills differ significantly based on selected demographic characteristics of students.

Major Skills Required for Employability

- Technical Skills: Technical skills are specific competencies related to a particular academic discipline or occupation. Engineering, information technology, management, healthcare, and other professional fields require students to possess appropriate technical knowledge and practical abilities. Curricula should therefore be regularly updated to reflect technological developments and changing occupational requirements.
- Communication Skills: Communication is one of the most important employability competencies. Graduates should be able to communicate ideas clearly through speaking, writing, presentations, and professional interactions. Good communication contributes to effective teamwork, leadership, customer relations, and workplace performance.
- Critical Thinking and Problem Solving: Modern organisations require employees who can analyse problems and make appropriate decisions. Higher education should encourage students to develop critical thinking through case studies, projects, discussions, research activities, and problem-based learning.

- Teamwork and Leadership: Most professional activities involve collaboration. Students should learn to work effectively with people from different backgrounds, share responsibilities, resolve differences, and contribute to common objectives. Leadership skills are also important for taking initiative and managing responsibilities.
- Digital Literacy: Digital transformation has changed almost every sector. Students require digital competence appropriate to their discipline. Basic digital literacy, information management, data handling, and familiarity with relevant software and technologies can significantly enhance employability.
- Adaptability and Lifelong Learning: The workplace is continuously changing. Graduates must therefore be willing to acquire new knowledge and adapt to changing technologies, roles, and working environments. Lifelong learning is increasingly important for sustainable career development.
- Soft skills: Soft skills are personal habits, social traits, and communication styles that shape how you interact with others and handle daily tasks.

Education-Industry Skill Gap

The education-industry skill gap can arise for several reasons. One major factor is the difference between rapidly changing industry requirements and relatively slow curriculum revision. In some institutions, students may receive extensive theoretical instruction but limited exposure to real workplace situations. Another factor is insufficient interaction between educational institutions and employers. Without regular industry feedback, institutions may find it difficult to identify emerging skills and occupational requirements. Limited internship opportunities, inadequate practical facilities, insufficient career guidance, and excessive dependence on traditional assessment methods can also contribute to the gap. Reducing this gap requires continuous communication between institutions and industry and greater emphasis on practical learning.

Role of Higher Education Institutions

Higher education institutions have a central responsibility in preparing students for employment. They can contribute by integrating employability skills into academic curricula rather than treating them as separate activities. Institutions should encourage:

- practical and project-based learning.
- internships and industry exposure.
- industry-oriented workshops.
- communication and soft-skill training.
- digital and technological skill development.
- entrepreneurship and innovation.
- career counselling and placement preparation and interaction with industry professionals.

Faculty members should also adopt teaching approaches that encourage creativity, independent thinking, collaboration, and application of knowledge.

Role of Industry-Academia Collaboration

Strong collaboration between industry and educational institutions is essential for reducing the skill gap. Industry professionals can participate in curriculum development, guest lectures, workshops, mentoring, internships, industrial visits, and project evaluation. Internships provide students with an opportunity to understand workplace culture and apply classroom learning to practical situations. Industry-based projects can further strengthen students' problem-solving and professional skills. Regular feedback from employers can help institutions identify changing skill requirements and modify their programmes accordingly.

Suggestions for Bridging the Gap

The following measures can help improve graduate employability:

- Update curricula regularly according to changing industry requirements.
- Increase practical learning through projects, laboratory activities, and experiential learning.
- Provide meaningful internships and industry exposure.
- Strengthen soft-skill development, particularly communication, teamwork, leadership and problem solving.
- Improve digital competence across academic disciplines.
- Increase industry participation in curriculum design and student training.
- Strengthen career guidance and placement services.
- Encourage entrepreneurship and innovation among students.
- Provide continuous professional development opportunities.
- Assess employability outcomes regularly to evaluate the effectiveness of institutional programmes.

Conclusion

Skill development is an essential component of graduate employability. In the contemporary employment environment, academic qualifications alone cannot fully meet workplace expectations. Graduates require a combination of technical knowledge, communication skills, digital competence, critical thinking, teamwork, problem-solving ability, adaptability, and practical experience.

The gap between education and industry can be reduced by making higher education more responsive to changing employment requirements. Curriculum revision, internships, practical learning, industry interaction, career guidance, and skill-development programmes can significantly improve students' workplace readiness. Bridging the education-industry gap is a shared responsibility. Higher education institutions must work closely with industry, policymakers, faculty members, and students to create meaningful learning opportunities. Such collaboration can produce graduates who are not only employable but also capable of continuous learning and adapting to the changing demands of the future workplace.

Abstract

Artificial Intelligence (AI) is reshaping educational landscapes worldwide by enhancing teaching, learning, assessment, and professional growth. The rapid advancement of generative AI, machine learning, intelligent tutoring systems, and predictive analytics has created unprecedented opportunities for teacher education and continuous professional development. This paper examines the transformative role of AI in preparing future teachers and supporting practicing educators. It explores various AI tools and platforms applicable to teacher education, discusses their pedagogical benefits, analyzes associated challenges, and proposes strategies for responsible integration. The study argues that AI should not replace teachers but augment their capabilities, enabling personalized learning, data-informed decision-making, and lifelong professional growth. The paper concludes with recommendations for integrating AI literacy and ethical competencies into teacher education programs.

Keywords: *Artificial Intelligence, Teacher Education, Professional Development, Generative AI, Educational Technology, AI Literacy.*

1. Introduction

The Fourth Industrial Revolution has accelerated the integration of Artificial Intelligence (AI) across multiple sectors, including education. AI technologies have evolved from simple automation tools to sophisticated systems capable of generating content, analyzing data, providing personalized feedback, and supporting complex decision-making processes. Educational institutions are increasingly adopting AI-driven technologies to improve learning outcomes and administrative efficiency.

Teacher education and professional development have become critical areas where AI can produce significant impacts. Future teachers must develop competencies that allow them to effectively integrate AI into pedagogical practices while maintaining human-centered approaches to learning. International organizations such as UNESCO emphasize the need for responsible and ethical implementation of Generative AI in education to protect human agency, equity, and inclusion. This paper explores how AI is transforming teacher preparation and professional development and identifies practical AI tools that can be effectively utilized by educators.

2. Understanding AI in Education

Artificial Intelligence refers to computer systems capable of performing tasks that

typically require human intelligence, including learning, reasoning, problem-solving, language processing, and decision-making.

In education, AI technologies include Generative AI, Machine Learning, Natural Language Processing (NLP), Intelligent Tutoring Systems, Learning Analytics, Adaptive Learning Systems, Chatbots, Virtual Assistants and Automated Assessment Systems. These technologies enable personalized learning experiences, automate routine tasks, and provide actionable insights for teachers and institutions.

3. AI and Teacher Education

3.1 Enhancing Teaching Competencies

Teacher education programs traditionally focus on pedagogy, curriculum design, assessment, and classroom management. AI expands these competencies by enabling future teachers to Design personalized learning experiences, Analyze learner data, create adaptive instructional materials, Develop digital and AI literacy and Foster critical thinking about AI-generated content. AI-powered platforms can simulate classroom scenarios, enabling preservice teachers to practice decision-making in safe virtual environments.

3.2 Personalized Learning for Teacher Trainees

AI systems can assess teacher candidates' strengths and weaknesses and provide customized learning pathways. Adaptive learning platforms recommend resources, activities, and assessments based on individual progress. This benefits Self-paced learning, Continuous feedback, Improved mastery of teaching skills and Individualized professional growth.

3.3 AI-Based Teaching Simulations

Virtual reality and AI-driven teaching simulations provide realistic classroom environments where teacher trainees can practice lesson delivery, Handle behavioral issues, Improve communication skills and Receive instant performance feedback. This will bridge the gap between theory and practice.

4. AI in Professional Development of Teachers

Professional development is no longer confined to workshops and seminars. AI enables continuous, personalized, and data-driven learning opportunities.

4.1 Continuous Learning Support

AI can recommend to search relevant research articles, Professional courses, attend Webinars and workshops and avail Curriculum resources. By this Teachers receive learning opportunities based on their interests and professional needs.

4.2 Automated Feedback and Reflection

AI tools can analyze Lesson plans, Teaching recordings and Student performance data. These analyses help teachers reflect on their instructional strategies and identify areas for improvement.

4.3 Data-Informed Decision Making

Learning analytics platforms collect and analyze student performance data, helping teachers to Identify learning gaps, Monitor progress, Personalize interventions and Improve classroom outcomes.

5. AI Tools for Teacher Education and Professional Development

5.1 ChatGPT (OpenAI), Google Gemini and Microsoft copilot: can be used for Lesson plans, Content generation, Assessment design, Presentation creation, Feedback creation and educational research support. This helps to save preparation time, supports differentiated instruction and enhances creativity

5.2 Canva AI is a user-friendly application used for educational infographics, Presentations, Visual lesson materials and to create educational posters

5.3 MagicSchool AI specifically Designed for educators for Lesson planning, Individualized Education Plans (IEPs), Assessment generation and for Classroom communication. This AI tool reduces the administrative workload of teachers and provides time for teaching.

5.4 Gradescope is an AI tool used for Automated grading, Assessment analytics and for Feedback generation. This tool helps for Faster evaluation and Consistent assessment practices.

5.5 Kahoot! AI and Quizizz AI used for Quiz generation, Formative assessment and Interactive classroom engagement. This improves student participation and to collect the Immediate feedback.

5.6 Turnitin AI Tools used for Academic integrity, Writing evaluation and feedback support. This Encourages responsible AI use and Promotes ethical academic practices.

6. Benefits of AI in Teacher Education and Professional Development

AI automates repetitive administrative tasks, allowing teachers to focus on instruction and student engagement. Which **Improves Teachers Efficiency.** Teachers receive customized recommendations based on their professional goals. It **Enhances Content Creation helps in** generating Lesson plans, Assessments, Case studies and Learning activities. AI tools helps for **Better Student Support.** Data analytics enable early identification of struggling learners and targeted interventions. AI promotes continuous professional growth by offering on-demand learning opportunities cultivates **Lifelong Learning Culture.**

7. Recommendations

To maximize the benefits of AI in teacher education and professional development, institutions should:

7.1 Integrate AI Literacy into Teacher Education

Teacher education curricula should include:

- AI fundamentals, Prompt engineering, Ethical AI usage, Critical evaluation of AI outputs

7.2 Develop Institutional Policies

Universities and schools should establish clear guidelines regarding:

- AI use, Data privacy, Assessment practices, Academic integrity

7.3 Promote Human-AI Collaboration

AI should function as an assistive tool rather than a replacement for teachers.

7.4 Strengthen Professional Development Opportunities

Regular AI-focused training programs should help educators:

- Explore emerging tools, Develop digital competencies, Implement innovative pedagogies

7.5 Encourage Ethical and Responsible Use

Teachers should model responsible AI practices and encourage students to critically engage with AI-generated content.

8. Conclusion

Artificial Intelligence is transforming teacher education and professional development by providing personalized learning opportunities, enhancing instructional design, supporting assessment, and promoting continuous professional growth. AI-powered tools such as ChatGPT, Microsoft Copilot, Gemini, Canva AI, MagicSchool AI, and Gradescope are redefining how educators learn, teach, and develop professionally. However, successful implementation requires careful attention to ethics, privacy, equity, and human agency.

The future of education lies not in replacing teachers with AI but in empowering teachers through AI. Educators who possess AI literacy, pedagogical expertise, and ethical awareness will be better equipped to prepare learners for an increasingly digital and intelligent world.

A STUDY OF B.ED. TRAINEES' EXPERIENCES IN THE USE OF EDUCATIONAL TECHNOLOGY IN TEACHING PRACTICE

Dr. Yadukumar M,
Assistant Professor, Kumadvathi College of Education, Shikaripura.

Abstract

Educational technology is an important component of contemporary teaching and teacher education. Its effective use during teaching practice helps B.Ed. trainees enhance classroom interaction, learner engagement, content presentation, and digital teaching competencies. However, trainees may face challenges related to technological skills, resources, infrastructure, and technical support. The present study aims to examine B.Ed. trainees' experiences and difficulties in using educational technology during teaching practice and to suggest measures for its effective integration. A descriptive survey design will be adopted, and data will be collected from B.Ed. trainees using a structured questionnaire. The findings are expected to provide insights into trainees' technology-use experiences and challenges and help teacher educators and institutions strengthen technology-integrated teaching practice programmes.

Keywords: *B.Ed. trainees, educational technology, teaching practice, digital pedagogy, teacher education, technology integration, classroom teaching*

Introduction

Educational technology has become an essential part of modern teaching and learning. It helps teachers make lessons more interactive, engaging, and effective through digital tools and resources. For B.Ed. trainees, teaching practice provides an opportunity to apply educational technology in real classroom situations.

However, trainees may face difficulties such as lack of resources, poor internet connectivity, technical problems, limited skills, and inadequate support. Therefore, it is important to study their experiences and challenges in using educational technology. The present study focuses on the experiences of B.Ed. trainees, the difficulties they face, and measures to improve the effective use of educational technology during teaching practice.

Need and Significance of the Study

The present study is significant as it helps assess the digital teaching competence of B.Ed. trainees and understand how they apply educational technology during actual classroom practice. It identifies practical challenges such as inadequate infrastructure, connectivity issues, limited access to devices, and technical difficulties, thereby helping teacher education institutions improve training programmes through workshops, demonstrations, and practical activities. The study also promotes innovative and learner-centred pedagogies and supports the preparation of future teachers to meet the growing digital demands of contemporary schools.

Statement of the Problem

A Study of B.Ed. Trainees' Experiences in the Use of Educational Technology in Teaching Practice

Objectives of the Study

- To study the experiences of B.Ed. trainees in using educational technology during teaching practice.
- To study the difficulties faced by B.Ed. trainees while using educational technology during teaching practice.
- To suggest measures for improving the effective use of educational technology in teaching practice programmes.

Methodology

Research Design: A descriptive survey research design adopted for the present study. The design is appropriate because the study aims to examine the experiences, challenges and confidence levels of B.Ed. trainees regarding educational technology.

Sample: A sample of 46 B.Ed. trainees selected from Kumadvathi College of Education, Shikariura.

Research tool: A self-developed Educational Technology Experience Scale for B.Ed. Trainees used. The tool consist of two sections.

- **Section – A:** Experiences in the Use of Educational Technology during Teaching Practice
- **Section – B:** Problems Faced While Using Educational Technology

A five-point Likert scale used: 5 – Strongly Agree, 4 – Agree, 3 – Undecided, 2 – Disagree, 1 – Strongly Disagree

Data Collection Procedure

Data were collected from 46 B.Ed. trainees of Kumadvathi College of Education, Shikaripura, using a structured questionnaire. The questionnaire was administered to the selected trainees to collect information regarding their experiences in using educational technology during teaching practice.

Data Analysis

The collected quantitative data may be analysed using: Percentage

Results and Interpretation

Section – A: Experiences in the Use of Educational Technology During Teaching Practice

Sl. No.	Questions	Response				
		Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree
1	Educational Technology made my teaching practice more effective.	32	13	1	0	0
		69.57%	28.26%	2.17%	0.00%	0.00%
2	I felt confident while using technological tools in the classroom.	17	25	3	0	1
		36.96%	54.35%	6.52%	0.00%	2.17%

3	Students showed more interest during technology-supported lessons.	28	16	2	0	0
		60.87%	34.78%	4.35%	0.00%	0.00%
4	Multimedia presentations improved students' understanding of concepts.	19	25	2	0	0
		41.30%	54.35%	4.35%	0.00%	0.00%
5	Educational Technology helped me manage the classroom effectively.	21	23	2	0	0
		45.65%	50.00%	4.35%	0.00%	0.00%
6	I was able to prepare digital teaching materials easily.	17	25	4	0	0
		36.96%	54.35%	8.70%	0.00%	0.00%
7	Smart classroom facilities supported my teaching practice.	20	23	3	0	0
		43.48%	50.00%	6.52%	0.00%	0.00%
8	Online resources helped me in lesson planning.	25	21	0	0	0
		54.35%	45.65%	0.00%	0.00%	0.00%
9	Educational Technology increased student participation in learning activities.	25	19	2	0	0
		54.35%	41.30%	4.35%	0.00%	0.00%
10	I enjoyed using technology during teaching practice.	20	21	5	0	0
		43.48%	45.65%	10.87%	0.00%	0.00%
11	Technology-based teaching improved my teaching skills.	20	21	5	0	0
		43.48%	45.65%	10.87%	0.00%	0.00%
12	I received adequate guidance from teacher educators in using Educational Technology.	27	17	2	0	0
		58.70%	36.96%	4.35%	0.00%	0.00%
13	Educational apps and software were useful in classroom teaching.	27	16	3	0	
		58.70%	34.78%	6.52%	0.00%	0.00%
14	Technology helped me explain difficult concepts more clearly.	22	22	2	0	0
		47.83%	47.83%	4.35%	0.00%	0.00%
15	I am motivated to use Educational Technology in my future career.	26	19	1	0	0
		56.52%	41.30%	2.17%	0.00%	0.00%

- **Teaching Effectiveness:** 97.83% of trainees agreed that Educational Technology made their teaching practice more effective.
- **Confidence in Technology Use:** 91.31% of trainees agreed that they felt confident while using technological tools in the classroom.
- **Student Interest:** 95.65% reported that students showed more interest during technology-supported lessons.
- **Improved Understanding:** 95.65% agreed that multimedia presentations improved students' understanding of concepts.
- **Classroom Management:** 95.65% felt that Educational Technology helped them manage the classroom effectively.

- **Digital Teaching Materials:** 91.31% reported that they could prepare digital teaching materials easily.
- **Smart Classroom Facilities:** 93.48% agreed that smart classroom facilities supported their teaching practice.
- **Lesson Planning:** 100% of the trainees agreed that online resources helped them in lesson planning.
- **Student Participation:** 95.65% reported that Educational Technology increased student participation in learning activities.
- **Enjoyment:** 89.13% of trainees enjoyed using technology during teaching practice.
- **Teaching Skills:** 89.13% agreed that technology-based teaching improved their teaching skills.
- **Guidance from Teacher Educators:** 95.66% reported receiving adequate guidance from teacher educators in using Educational Technology.
- **Educational Apps and Software:** 93.48% found educational apps and software useful for classroom teaching.
- **Explanation of Difficult Concepts:** 95.66% agreed that technology helped them explain difficult concepts more clearly.
- **Future Motivation:** 97.82% of trainees were motivated to use Educational Technology in their future teaching career.

Section – B: Problems Faced While Using Educational Technology

Sl. No.	Questions	Response				
		Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree
1	Lack of infrastructure affected my use of technology.	14	17	4	11	0
		30.43%	36.96%	8.70%	23.91%	0.00%
2	Internet connectivity problems disturbed classroom teaching.	7	24	4	5	6
		15.22%	52.17%	8.70%	10.87%	13.04%
3	I faced technical difficulties while using digital tools.	9	14	11	6	6
		19.57%	30.43%	23.91%	13.04%	13.04%
4	Lack of sufficient training created challenges in using Educational Technology.	10	19	9	4	4
		21.74%	41.30%	19.57%	8.70%	8.70%
5	Limited availability of devices affected teaching effectiveness.	10	22	7	7	0
		21.74%	47.83%	15.22%	15.22%	0.00%
6	Power failure interrupted technology-based teaching.	12	16	7	9	2
		26.09%	34.78%	15.22%	19.57%	4.35%

7	Time limitations reduced effective use of Educational Technology.	6	20	10	5	5
		13.04%	43.48%	21.74%	10.87%	10.87%
8	Some students were not familiar with digital learning tools.	13	21	5	6	1
		28.26%	45.65%	10.87%	13.04%	2.17%
9	I needed more technical support during teaching practice.	15	23	3	3	2
		32.61%	50.00%	6.52%	6.52%	4.35%
10	Excessive use of technology sometimes distracted students.	12	19	5	3	7
		26.09%	41.30%	10.87%	6.52%	15.22%

- **Lack of Infrastructure:** 67.39% of trainees agreed that inadequate infrastructure affected their use of technology.
- **Internet Connectivity:** 67.39% reported that internet connectivity problems disturbed classroom teaching.
- **Technical Difficulties:** 50.00% of trainees faced technical difficulties while using digital tools, while 23.91% remained neutral.
- **Insufficient Training:** 63.04% agreed that lack of sufficient training created challenges in using Educational Technology.
- **Limited Availability of Devices:** 69.57% reported that limited availability of devices affected teaching effectiveness.
- **Power Failure:** 60.87% agreed that power failures interrupted technology-based teaching.
- **Time Limitations:** 56.52% felt that time limitations reduced the effective use of Educational Technology.
- **Students' Digital Familiarity:** 73.91% reported that some students were not familiar with digital learning tools.
- **Need for Technical Support:** 82.61% of trainees indicated that they needed more technical support during teaching practice, representing the **highest reported challenge**.
- **Student Distraction:** 67.39% agreed that excessive use of technology sometimes distracted students.

Major Findings

- The findings indicate that B.Ed. trainees had highly positive experiences with Educational Technology during teaching practice.
- No trainee reported disagreement with any of the 15 statements.
- The highest positive response was for online resources supporting lesson planning (100%).
- The findings suggest that Educational Technology contributes positively to teaching effectiveness, student engagement, classroom management, lesson planning, and development of teaching competencies

- The major challenges identified were lack of technical support (82.61%), students' limited familiarity with digital tools (73.91%), limited availability of devices (69.57%), and infrastructure and internet connectivity problems (67.39% each).
- 50% of trainees experienced technical difficulties, indicating a need for better technical preparation and support.
- Overall, the findings suggest that although trainees use Educational Technology positively, infrastructure, technical support, training, connectivity, and student digital literacy remain important barriers to its effective integration.

Educational Implications

- **Strengthening Digital Competence:** B.Ed. programmes should provide regular practical training to develop trainees' skills and confidence in using Educational Technology.
- **Improving Technical Support:** Adequate technical assistance should be provided during teaching practice to help trainees overcome difficulties while using digital tools.
- **Enhancing Infrastructure:** B.Ed. institutions and practice-teaching schools should ensure adequate availability of smart classrooms, digital devices, internet connectivity, and power backup.
- **Providing Hands-on Training:** Workshops, demonstrations, peer learning, and practical assignments should be organized to improve trainees' ability to integrate technology effectively into lessons.
- **Developing Students' Digital Literacy:** Trainees should be encouraged to provide necessary guidance to school students who have limited familiarity with digital learning tools.
- **Promoting Effective Pedagogy:** Technology should be integrated with appropriate teaching strategies to enhance student engagement, understanding, participation, and classroom interaction.
- **Effective Time Management:** Trainees should be trained to plan technology-supported lessons efficiently so that technical preparation does not reduce instructional time.
- **Balanced Use of Technology:** Trainees should use technology purposefully and appropriately to avoid student distraction and ensure that technology supports, rather than replaces, effective teaching.
- **Strengthening Teacher Education Curriculum:** Findings can be used to strengthen the Educational Technology component of B.Ed. programmes by giving greater emphasis to practical classroom application.
- **Continuous Professional Development:** Teacher educators should encourage continuous learning and updating of digital skills so that future teachers can adapt to emerging technologies and changing educational needs.

Conclusion

The present study concludes that B.Ed. trainees had highly positive experiences with the use of Educational Technology during teaching practice. Technology was found to enhance teaching effectiveness, student participation, interest, understanding, lesson planning, and teaching

competencies. However, challenges such as inadequate technical support, limited digital devices, infrastructure and internet connectivity problems, insufficient training, and students' limited familiarity with digital tools were identified. Therefore, providing adequate infrastructure, technical support, practical training, and continuous professional development is essential for the effective and meaningful integration of Educational Technology in teacher education and school teaching.

Abstract

In order to produce effective, thoughtful, and creative educators who can adapt to the ever-changing demands of education, teacher educators are essential. Teacher educators must participate in ongoing learning to preserve their professional competence in the quickly changing educational landscape of today, which is marked by globalisation, technology breakthroughs, educational reforms, and a variety of learner demands. Throughout their careers, teacher educators can continuously enhance their knowledge, pedagogical skills, research capabilities, leadership attributes, and digital competences through an ongoing, methodical, and collaborative process known as Sustainable Professional Development (SPD). SPD places a greater emphasis on lifelong learning, reflective practice, collaborative inquiry, mentoring, action research, and continual improvement than traditional one-time training programs.

Keywords: *Sustainable Professional Development, Teacher Educators, Continuous Professional Development (CPD), Teacher Education, Reflective Practice, Professional Learning Communities, Artificial Intelligence, Digital Learning, Educational Innovation*

Introduction

The foundation of social, economic, and national progress is universally acknowledged to be education. Teachers are the most important contributors to the quality of education among all educational resources. However, the proficiency and knowledge of teacher educators, who are in charge of training future educators and fostering their professional development, have a significant impact on the calibre of educators. Therefore, enhancing the abilities of teacher educators is crucial to raising the standard of education as a whole. Globalisation, digital technology, competency-based curriculum, inclusive education, and artificial intelligence have all significantly altered educational practices in the twenty-first century. Teacher educators must constantly refresh their instructional expertise, research abilities, technical proficiencies, and professional attitudes in light of these advancements. Professional development is now seen to be a continuous process of learning and professional development rather than a set of discrete workshops. Throughout their careers, educators can enhance their teaching methods, leadership abilities, research capacities, and technical proficiencies through Sustainable Professional Development (SPD), which is defined as ongoing, methodical, and significant professional

learning. It promotes cooperation, introspection, creativity, and evidence-based practice while emphasising long-term development over short-term training. Teaching, curriculum creation, educational research, mentorship, assessment, academic leadership, and community participation are just a few of the many responsibilities demanded of teacher educators. These duties necessitate ongoing professional development as well as adjustment to new technological advancements and educational regulations. Teacher educators can continue to be efficient, adaptable, and creative in carrying out their many duties with the support of sustainable professional development. The National Education Policy (NEP) 2020 in India highlights ongoing professional development as a crucial tactic for raising educational standards. It suggests providing teachers and teacher educators with frequent chances for professional development through seminars, online courses, mentorship programs, research projects, and professional learning communities. Organisations that support lifelong professional learning include the National Council for Teacher Education (NCTE), the University Grants Commission (UGC), DIKSHA, SWAYAM, and PM eVIDYA.

Significance of the Study

- Highlights the importance of continuous professional learning for teacher educators.
- Explains the principles and models of sustainable professional development.
- Examines the role of ICT, AI, and digital technologies in professional learning.
- Reviews national and international policy perspectives on teacher educator development.
- Suggests practical strategies for strengthening professional development systems in teacher education institutions.

Objectives of the Study

- To comprehend the idea of teacher educators' Sustainable Professional Development (SPD).
- To investigate the necessity and significance of ongoing professional development in teacher preparation.
- To determine the tenets and traits of long-term professional growth.
- To investigate the different techniques and strategies for teacher educators' professional development.
- To examine how artificial intelligence (AI) and information and communication technology (ICT) contribute to long-term professional development.
- To examine worldwide and national policies concerning the professional development of teacher educators
- To determine the difficulties in putting sustainable professional growth into practice.
- To make suggestions and tactics for enhancing teacher educators' long-term professional development.

Concept of Sustainable Professional Development

Teachers can increase their teaching effectiveness and educational quality by continuously improving their knowledge, abilities, attitudes, and competences through professional development. Sustainable Professional Development (SPD) encourages lifelong, collaborative,

and reflective learning, going beyond sporadic workshops or training sessions.

Opportunities for ongoing learning that let teacher educators adjust to curriculum modifications, technology advancements, educational reforms, and changing student demands are what define SPD. It motivates teachers to develop into thoughtful professionals who actively participate in research, creativity, and teamwork.

Sustainable professional development is integrated into educators' everyday work lives, in contrast to traditional professional development, which frequently concentrates on discrete training programs. It is continuous, evidence-based, context-specific, and in line with educational policies and institutional objectives.

Definitions of Sustainable Professional Development

Guskey (2002) Professional development refers to systematic efforts that bring about change in teachers' classroom practices, beliefs, attitudes, and student learning outcomes.

Day (1999) Professional development is the process by which educators renew and extend their commitment to teaching and acquire the knowledge, skills, and emotional intelligence necessary for effective professional practice throughout their careers.

Characteristics of Sustainable Professional Development

Effective Sustainable Professional Development possesses several distinctive characteristics.

- **Continuous Process**

  After initial teacher preparation, professional development continues. To maintain their professional competence, teacher educators continue to learn throughout their careers.

- **Lifelong Learning**

  In reaction to societal shifts, technological breakthroughs, and educational reforms, SPD urges educators to constantly refresh their knowledge.

- **Reflective Practice**

  To determine their strengths and opportunities for development, teacher educators routinely assess their own professional practices, teaching, and research.

  Continuous improvement and evidence-based decision-making are encouraged by reflection.

- **Collaborative Learning**

Professional learning becomes more effective when educators collaborate through:

- Professional Learning Communities (PLCs)
- Peer observation
- Team teaching
- Mentoring
- Academic networking

Collaboration encourages knowledge sharing and collective problem-solving.

- **Research-Oriented**

Teacher educators are expected to engage in:

- Action research
- Educational research

- Classroom research
- Innovation projects

Research enables evidence-based improvements in teaching practices.

- **Context-Specific**

  Instead of implementing generic training programs, professional development should meet the real requirements of educators within their institutional and cultural contexts.

- **Technology-Enabled**

Modern professional development integrates digital technologies such as:

- Learning Management Systems (LMS)
- MOOCs
- Artificial Intelligence tools
- Virtual workshops
- Webinars
- Online collaborative platforms

Technology provides flexible access to learning opportunities.

- **Learner-Centred**

  Innovative educational strategies that improve student engagement, critical thinking, creativity, and problem-solving are taught to teacher educators.

- **Evidence-Based**

Effective professional development is based on:

- Educational research
- Classroom evidence
- Student learning outcomes
- Institutional data
- Reflective practice

Sustainable and Long-Term

SPD encourages ongoing professional development that is incorporated into regular professional practice rather than concentrating on discrete seminars.

Principles of Sustainable Professional Development

The effective use of sustainable professional development is guided by a number of principles.

Principle 1: Lifelong Learning

Throughout their careers, teacher educators should keep up with the latest developments in their field.

Principle 2: Reflective Practice

Teachers can enhance the efficacy of their instruction by critically analysing their methods through reflection.

Principle 3: Collaboration

Collaboration, peer coaching, mentoring, and professional learning groups should all be a part of professional learning.

Principle 4: Relevance

The actual demands of teacher educators and educational institutions must be taken into consideration in professional development activities.

Principle 5: Active Participation

Discussions, projects, research, demonstrations, and cooperative problem-solving should all be actively pursued by teacher educators.

Principle 6: Continuous Assessment

Professional growth should be regularly monitored using:

- Self-assessment
- Peer review
- Student feedback
- Performance evaluation
- Reflective journals

Principle 7: Technology Integration

Digital platforms, ICT, and AI should facilitate adaptable, individualised, and ongoing professional development.

Principle 8: Innovation

Innovative teaching techniques, educational technologies, and research-based teaching methodologies should be tested by teacher educators.

Principle 9: Inclusiveness

All teacher educators should have access to professional development programs, regardless of their location, age, gender, or institutional affiliation.

Principle 10: Institutional Support

Successful professional development requires:

- Administrative support
- Financial assistance
- Policy encouragement
- Recognition and incentives
- Leadership commitment

Conclusion: Teacher educators can maintain their professional competence in a continuously evolving educational environment through the lifelong, collaborative, reflective, research-based, and technology-supported process of sustainable professional development. Lifelong learning, cooperation, innovation, inclusivity, relevance, and institutional support are some of the tenets that serve as its compass. These ideas serve as the cornerstone for both successful teacher preparation programs and ongoing enhancements to the standard of education.

Introduction

Information and Communication Technology (ICT) is the buzzword today everywhere as the world has entered into an information and communication age. Computers have proliferated, becoming increasingly fast, powerful, small and cheap, so that now there is scarcely a human activity in which they are not to be found, bearing an increasing share of the burden of repetitive information processing activities. Now, information cannot only be stored, retrieved, communicated, and broadcasted in enormous quantities and at phenomenal speeds, but it can also be rearranged, selected and transformed, of the human brain. While creative, judicious, moral, and aesthetic choices are still best left to people, all the tedious and mechanical mental processes can now be relegated to the accurate, fast, and tireless machines. Now a day's, ICT is the most powerful, effective, easy and rapid media in the communication of information. Hence, in the present study an effort has been made to study the relationship of awareness of ICT, use of ICT, attitude toward ICT with teaching effectiveness.

Review :An Overview

In review of the related studies, most of the studies are either related to awareness or use of technology. It can be further stated that most of the studies are specifically related to the computer and internet further looking at a glance to the above studies, it can be revealed that most of the studies were conducted abroad and very few studies were conducted in India. Many of the studies revealed that a great degree of awareness about the ICT of teachers but less usage due to one or other reasons. Further, it was found that there were many studies carried out related to teachers' awareness of technology and teachers use of technologies but only few studies conducted which are related to the teachers need of technologies.

The variables teachers' attitude towards *ICT* and their technology competence are explored vastly and independently in some studies. The investigator feels that there is a need to further explore the influence of these variables in order to improve teaching learning process. The review of related literature presents a glut of researches presently being conducted in field of variables like use of *ICT*, their attitude towards *ICT* and technology competence. Based on the research studies, the researcher felt that there is a need to explore the use of *ICT* by teachers in relation to their attitude towards *ICT* and technology competence in schools that it will help to adjudged the extent of all the variables related to teachers and suggest measures to overcome the

problems of teachers in the application of *ICT* in teaching-learning Process.
